USEFUL KNOWLEDGE.

B U F

B U F

BUFFON, GEORGE LOUIS LE CLERC, COMTE DE, son of Benjamin Le Clerc Buffon, a councillor of parliament, was born at Montbard, in Burgundy, on the 7th September, 1707, a year which was also marked by the entrance of Linné into life. We first trace the young Buffon at Dijon, where he was entered at the Jésuits' college as a student of law; but it would appear that the legal profession, which his father wished him to adopt, had no charms for him, and that astronomy and mathematics were his favourite pursuits. The parent, observing his son's disgust at the former study and his zealous application to the last-named sciences, wisely suffered him to follow the path which he had chosen; and he became so wedded to his geometry that some of his biographers assert, that while his companions were at their sports he was generally to be seen in some retired nook poring over his pocket Euclid, which he seems to have cherished at this early age with no less affection than Parson Adams had for his *Æschylus*. Such a mode of spending hours, which would otherwise have been hours of idleness, brought forth its fruits in due season, and there are stories current that he had anticipated Newton in some of his discoveries, but that he withheld his claim, observing that people were not obliged to believe the assertion. We receive these *on dit*s with some grains of allowance, for, to say nothing of dates, vanity was certainly not absent as an ingredient in Buffon's character.

An acquaintance which he had made with Lord Kingston and his tutor, at Dijon, soon ripened into friendship, and Buffon travelled through Italy with these companions, the latter of whom appears to have been a man of science, while the former was the ready partner in his pleasures. The death of his mother, whom he lost during this expedition, put him in possession of a large income, nearly 12,000*l.*, at an early age, and having become entangled in some affair, on his return to Montbard, he found it advisable to leave that place; and he accordingly went to Paris, and visited England. We do not find him settled on his estate 'for good' till the age of twenty-five. In this retirement he resolutely pursued his studies, and as it may not be uninteresting to those who think life was not given to us to be passed in mere frivolities, to know how Buffon passed his time, we select the following account from a modern biographer, premising that the history of one day seems to have been that of all the others, generally speaking, throughout a period of fifty years. 'After he was married he dictated letters, and regulated his domestic affairs, and at six o'clock he retired to his studies at the pavilion called the Tower of St. Louis. This pavilion was situated at the extremity of the garden, about a furlong from the house, and the only furniture which it contained was a large wooden secretary and an arm-chair. No books or pictures relieved the naked appearance of the apartment, or distracted the thoughts of the learned possessor. The entrance was by green folding-doors, the walls were painted green, and the interior had the appearance of a chapel, on account of the elevation of the roof. Within this was another cabinet, where Buffon resided the greater part of the

year, on account of the coldness of the other apartment, and where he composed the greater number of his works. It was a small square building, situated on the side of a terrace, and was ornamented with drawings of birds and beasts. Prince Henry of Prussia called it the cradle of natural history; and Rousseau, before he entered it, used to fall on his knees and kiss the threshold. At nine o'clock Buffon usually took an hour's rest; and his breakfast, which consisted of a piece of bread and two glasses of wine, was brought to the pavilion. When he had written two hours after breakfast, he returned to the house. At dinner he spent a considerable portion of time, and indulged in all the gaieties and trifles which occurred at table. After dinner he slept an hour in his room, took a solitary walk, and, during the rest of the evening, he either conversed with his family or guests, or sat at his desk examining the papers which were submitted to his judgment. At nine o'clock he went to bed to prepare himself for the same routine of judgment and pleasure. Among his other studies the alleged burning of the Roman fleet, under Marcellus, by Archimedes, on its approach within bow-shot, by means of mirrors, attracted his attention, and he commenced a series of experiments, with the view of verifying the fact. After several experiments and considerable expense, he constructed a great mirror, composed of 168 pieces of plain silvered glass, six inches by eight. Between each was an interval of four lines. These intervals gave the experimentalist a view of the point on which the machine was to be directed, and the contrivance allowed of extensive motion; for the whole of the pieces were set in an iron frame, with an apparatus of screws and springs. Having made his preparations he commenced his experiments, and, on the 23rd of March, a plank of beech, which had been covered with tar, was set on fire at the distance of sixty-six feet, only forty mirrors being brought to bear on it, and without their being set in the stand. On the same day ninety-eight mirrors, under some disadvantageous circumstances, ignited a tarred and sulphured plank, at the distance of 126 feet. On the 3rd of April, at 4 o'clock p.m., a board, covered with small pieces of wool, was placed at the distance of 138 feet, and the rays from 112 mirrors slightly inflamed it. The next day, at 11 o'clock a.m., 154 mirrors caused a tarred plank, fixed at a distance of 150 feet, to smoke densely in two minutes; but just as the experimentalists were expecting it to burst into flame, the sun was obscured. At 3 o'clock, on the 5th of the same month, 154 mirrors fired small sulphured chips of deal, mingled with charcoal, at the distance of 250 feet, when the day was not bright; a few seconds were sufficient to produce ignition when the sun shone powerfully. An unclouded and clear sun, soon after mid-day of the 10th of April, inflamed very suddenly a tarred plank, the distance being 150 feet, and the number of mirrors brought into action being 128; at half-past two on the same day a beech plank, partially sulphured, and covered in other parts with small pieces of wool, was inflamed so suddenly and strongly that it became necessary to

plunge it into water for the purpose of quenching the fire : 146 mirrors performed this at a distance of 150 feet. On the 11th of April some small combustibles were ignited by 12 mirrors, at 20 feet ; a large pewter flask, 6 lbs. in weight, was melted by 43 mirrors at the same distance, and some thin pieces of silver and iron were brought to a red heat by 17. These experiments led him to others, having for their object the structure of mirrors by bending glass upon spherical moulds ; but his great difficulty appears to have been encountered in the cooling and grinding, and only three, it is said, were preserved out of twenty-four. He presented one of these, having a diameter of 46 inches, and considered as the most powerful burning-glass in Europe, to the King of France.

Hitherto we have seen Buffon devoting himself to his studies with unwearied diligence ; but the more abstruse of the sciences and the formation of his style appear to have almost entirely occupied him up to a certain period.

Some few years, however, before he commenced the experiments above recorded, he was, at the age of thirty-two (about the year 1739), called to succeed M. Dufay, who, struck by a mortal disease (the small-pox), had recommended Buffon to the minister as the only man capable of following up his projects in the office of intendant of the Royal Garden and Museum, where he planted the two avenues of lime-trees which terminate towards the extremity of the nursery, and mark the limits of the garden at that period. The appointment seems to have at once awakened his dormant love for the study of natural history. His ardent mind took an immediate and comprehensive view of the subject, and commencing with the theory or history of the earth as his basis, he followed it out through the great work which has immortalized his name as a zoologist, calling to his assistance the talents of men who were most deeply versed in particular branches of the study :—the names of Daubenton and Lacépède stand pre-eminent among those who were thus associated with him.

His marriage with Mademoiselle de Saint Belin, in 1762, appears to have been productive of great happiness to both parties, for she is recorded as anxiously watching all his steps on the road to fame, and rejoicing with him at the honours which were showered upon him by crowned heads and learned societies. Louis XIV., in 1776, raised his estate into a comté, and invited him to Fontainebleau, with a view of inducing him to accept the office of Administrator of the Forests of France, but Buffon declined the office.

His days appear to have been passed in great tranquillity, uninterrupted till a late period of his life, when that cruel disease, the stone, came to imbitter the rest of it. This torturing malady seems to have become seriously distressing about his 73rd year. He was importuned to submit to an operation, but he never would consent, though his medical attendants assured him of relief : their opinion, it is stated, was confirmed on examination after his death, which took place on the 16th of April, 1788, at the age of 81, after eight years of intense suffering. Fifty-seven stones, some of them as large as a bean, are said to have been found in his bladder.

His body was embalmed, and placed in the same vault with that of his wife, at Montbard.

The respect paid to his memory was great, and reflected honour on the assemblage of academicians and persons of rank and distinction who followed his remains to the tomb. It is said that above 20,000 people had congregated to see the funeral pass.

Condorcet, Broussonet, Vieq d'Azvz, and Lacépède were his principal eulogists.

Buffon left an only son, whose abilities were considerable, and whose attachment to his parent was extreme, if indeed filial love can ever be extreme. He was in the army, and had risen to the rank of major in the regiment of Angoumois. We have seen the father's obsequies celebrated by the great and good, and attended by the people ; but this homage to a great genius was soon to give way to the storm that darkened the political horizon of all Europe. The son of the great Comte de Buffon expiated the crime of his birth on the scaffold which had already reeked with the noblest blood of France ; and even the bones of the father—the man whom the people had delighted to honour—could not escape desecration. The remains of the illustrious zoologist were torn from the grave ; the lead in which he was hearsed was plundered, and his monument was razed to the ground. It is confidently stated, that among the frenzied populace

who perpetrated this sacrilege were many of his own retainers—of those who had followed him to that very grave with reverential mourning. Nor were this baseness and disgrace confined to a host of furious madmen, drunk with political excitement ; for when a citizen, to whom science was dear, complained to the Committee of Public Instruction of the outrage, and proposed that Buffon should have a place in the Pantheon, he was answered that the temple would be profaned by the presence of one who had been connected with the aristocracy of France.

The character of Buffon's mind seems to have been comprehensive, exhibiting an insatiable desire of knowledge joined with a persevering fondness and appetite for study rarely to be found : to these gifts nature had added a most fervid imagination, and his biographers have superadded no small portion of vanity. If by vanity be meant an anxious solicitude for a literary immortality, 'that last infirmity of noble minds,' which was continually betraying itself, Buffon was without doubt a vain man. He would read to his visitors those passages in his works which were his greatest favourites, such as portions of his natural history of man, the description of the Arabian deserts in the account of the camel, and his poetical pages on the swan. The last affected Prince Henry of Prussia, to whom the author read it when he was on a visit to Montbard, so strongly that he sent to the zoologist a service of porcelain on which swans were represented in almost every attitude.

Buffon was of a noble countenance and commanding figure, and his fondness for magnificence and dress seem to have amounted almost to a passion. It is curious to observe such an intellect as his finding time in the midst of the severest studies to submit his head to the friseur often twice and sometimes three times in the day, and to make his toilet in the extreme of the fashion. On a Sunday, after the service of the church, the peasantry of Montbard came to gaze on the count, who, clad in the richest dress, and at the head of his son and retainers, was wont to exhibit himself to their admiring eyes. This last exhibition however may have been a trait of the times.

His devotion to study soon ripened into a habit, and became his solace under the excruciating torments which unbittered the last years of his life. When asked how he had found time to do so much, he would reply, 'Have I not spent fifty years at my desk ?'

Buffon's style was brilliant and eloquent even to the verge of poetry ; and it is worthy of remark that a mind which had been trained and disciplined in the severity of the exact sciences should surrender the reins so entirely to the most luxuriant but wildest imagination. Hence, as is observed in the article on birds, he was often arraigning nature at the bar of his fancy for some supposed defect of design, when the fault was in his own want of perception of the end to which that design was directed, arising from his not being acquainted with the habits to which it ministered. His observations on the bill of the avoet, on the structure of the sloth, and on the melancholy condition of the wood-pecker (*picus*), are examples of this habit ; upon the wood-pecker he is quite pathetic, but, as in all such cases, he bestows his pity upon a very unworthy object.

He has been charged with infidelity : but this, like some others, is a charge easy to be made and hard to be disproved, though it must be admitted that his works afford ground for it. There is no doubt that his opinions drew down the censure of the Sorbonne, and in the 4th vol. of his 'Histoire Naturelle' will be found the letters of the Faculty of Theology and the answers. His moral character, we are compelled to add, was far from good, there being too much evidence in proof of his licentious habits and conversation to admit of doubt on the subject.

His works were numerous, and have obtained for him that fame which he is said to have so much desired. His translations of Hales's 'Vegetable Statics,' and of Newton's 'Fluxions,' both of which he prefaced with great ability, appear to have been undertaken with a view of improving his style as well as of advancing his knowledge. The *Memoirs* of the Royal Academy, of which he was so distinguished a member, contain many of his papers ; but without entering into these and other compositions, we proceed to the notice of his *opus magnum*, the 'Histoire Naturelle.' Of the 4to. editions the first in 36 vols., printed at the royal press, appeared in 1749, and was in a course of publication down to 1788 ; another was published in 1774 and the following years, in 26 vols., but this is comparatively of less value, for

though it contains the supplementary matter, Daubenton's *Anatomy* is cut out, and the plates are considered as worn and bad. Of the Supplement 6 vols. appeared in Buffon's life-time. The 7th was published in 1789, by Lacépède, after Buffon's death, and, in it, Lacépède expressed his deep regret for the loss.

In the department of the birds Buffon was assisted by M. Gueneau de Montbeillard, Baillon, and the Abbé Bexon. There are 5 vols. on minerals: a history of vegetables was also contemplated.

The magnificence of the 'Planches Enluminées' is well known to every collector.

The 'Histoire Naturelle' has been translated into Italian, Spanish, Dutch, German (twice with additions), and English.

Voltaire, D'Alembert, and Condorcet were among the most severe critics of Buffon's hypotheses; but the first did not add to his fame by an attack which exhibited more point than learning, and the last pronounced his eulogy. (*L'Homme aux quarante écus*, chap. 6: and also *Dialogues d'Écèneire*, &c., vol. xxxv. ed. of Lequien.) His system of organic molecules, and his theory of generation, faded before the luminous observations of Haller, Spallanzani, and other experimental philosophers.

BUFFOON, a jester: the name is said to be derived from 'buffa,' a word of the corrupt latinity of the middle-ages, synonymous with 'alapa,' i. e. a slap on the cheek. 'Buffe' and 'Buffer' in the old French, and *Boetada* in Spanish, were used in the same sense. Mountebanks and clowns in the farces used frequently to swell their cheeks with wind and then give each other a slap which produced a noise, to the amusement of the spectators. Hence are derived the word *Buffones* in Latin, the French *Bouffons*, and the Italian *Buffoni* (Ducange). *Buffare* or *buffare* in Italian means to puff the wind through the mouth. The English word *buffoon* is now generally used in a contemptuous sense. The Italians have two distinct words, *Buffo* and *Buffone*. *Buffo* is a theatrical term: *opera buffa*, *commedia buffa*, is a burlesque play, in contradistinction to *opera seria* and *commedia di carattere*, or serious comedy. The *buffo* is one of the principal characters in those plays corresponding to the English clown; in an opera there are often two, *primo buffo* and *secondo buffo*. *Buffone* in Italian means a funny ludicrous fellow, but not always in a contemptuous sense. *Bouffon* in French and *buffoon* in English have been occasionally used as synonymous with king's fool, a well-known character at courts in former times.

BUFO. [*Frog*.]

BUG, one of a numerous tribe of insects which constitute the order Hemiptera, belonging to the family Coreidae (*Leach*), and genus (*Lin.*), under which head the structure of the common bug together with its generic characters is given: at present we will confine ourselves to a brief account of the habits of this insect.

It has been said that the bed bug was not known in England previous to the great fire of London in 1666, and that it was first imported from America in the timber brought over to rebuild that city; of the accuracy of this statement however there is considerable doubt. It appears to have been well known in various parts of Europe long before that time. Its shape, colour, and the offensive smell which it emits when touched, together with the circumstance of its deriving its nutriment from blood sucked through a long pointed proboscis, which when not in use lies parallel with the underside of the body, are all circumstances too well known to need comment. The female bug deposits her eggs in the beginning of summer; they are of a tolerable size compared with that of the insect, of a whitish colour, and each fixed to a small hair-like stalk, which, when the egg is first deposited, is apparently of a glutinous nature, and readily adheres to anything which it touches. The places generally chosen to deposit the eggs in are the crevices of bedsteads and other furniture, or the walls of a room. In about three weeks it is said these eggs hatch, and the young bug comes forth—an active larva, very closely resembling the parent insect except in size.† The larva then undergoes the usual transformation, and becomes a perfect insect in about three months.

What was the natural history of this insect, differs from most of its tribe, having no wings, is difficult to say; the species of bug which come nearest to it in affinity are generally found under the bark of trees, a habitat which the flat form of our insect is well adapted for. Pigeons, swallows, &c., are said to be harassed by bugs as well as man.

Various means have been proposed for destroying these insects, but we would recommend cleanliness as the best.

BUG (river). [*Boe*.]

BUGEY, an Alpine district of France, inclosed on the S.E., S., and S.W. by the Rhône, which here forms a considerable bend; several maps, however, make it extend across the Rhône into Savoy. It is a mountainous country; the heights are crowned with wood, especially firs; the valleys afford pasturage to a great quantity of cattle, from whose milk the inh. make cheese, which furnishes them with an important article of trade. The other chief articles of trade are cattle, wood, nuts, and hemp. The little city of Belley was the capital of the district.

Bugey formerly was subject to the counts (afterwards dukes) of Savoy, by whom it was ceded to France by the treaty of Lyon, A.D. 1601.

BUILDING ACT. [*Brick*, p. 410.]

BUILT. [*Brick*.]

BUITENZORG. [*Java*.]

BULAMA. [*Bissagos*.]

BULB, a bud, usually formed under ground, having very fleshy scales, and capable of separating from its parent plant. Occasionally it is produced upon the stem, as in some lilies. [*Bud*.]

BULBOUS PLANTS, or those which spring from a bulb, form so peculiar a class among the objects of the gardener's care, as to require a short notice.

Bulbous plants are usually found wild in light sandy soil, in sheltered places: they spring up in the wet season, grow rapidly, and flower beneath a steady sun, and by the time their seeds are ripe their leaves wither, and the bulbs fall into a state of rest, which lasts generally for half the year. When they first begin to grow, their young stems are nourished to a great degree by the inspissated sap contained in the fleshy scales of which all bulbs consist; by the time they have acquired vigour enough to attract a sufficiency of nutritive matter from the soil by aid of their roots, the bulbs are so much exhausted that their external scales never recover, but dry up and fall away, while their place is supplied by an addition of new scales to the centre of the bulb. In order to secure flowers, and a state of vigorous health for the succeeding year, it is necessary that the new scales should, during the growing season, be filled as completely with nutritive secretion or inspissated sap, as those were that first existed; and it is this to which the cultivator has especially to direct his attention. Now the only way to secure this result is to prevent the leaves during the whole time of their growth to the influence of solar light, because it is only by such agency that nutritive matter can be generated. If this is attended to, bulbous plants will go on growing and flowering and multiplying themselves from year to year, provided care is taken, firstly that the soil which actually surrounds the bulbs, which are extremely succulent, is not retentive of moisture; and secondly, that the roots when they are emitted should have access to an abundant store of food. These circumstances are attended to with great care by the Dutch, who possess an exclusive trade of some value in hyacinths, tulips, and similar plants, in consequence of their low sandy fields being naturally capable of satisfying the conditions above mentioned. This will be evident from the following account given of the bulb-grounds near Haarlem by a competent observer:—

Wherever the bulbs do well, he found the soil to be of the lightest description of sand, such as can be blown away by the wind, with the water standing under it not nearer the surface than 15 inches, nor farther below it than 2 feet 6 inches. This, it seems, is the level of the water in the adjoining canals and ditches; and it is owing mainly to the points of the fibres going down to this water that the plants are so fresh and vigorous, while the dry sand above prevents their bulbs from being rotted. As a proof of the exceeding lightness of the soil, immediately after putting in a crop in the spring season, the surface is raked, and generally thrown into beds; cow-dung mixed with water is then thrown from barrels wheeled along the alleys over the whole surface with a scoop, so as to cover it all with a thin

* *Sommier's Histoire Naturelle, generale et particulière, accompagnée de notes, &c.*, published at Paris from 1798 to 1807, forms a complete course of Natural History, in 127 vols. 8vo., containing Buffon's works, and the labours of the most able naturalists of the time, who assisted the editor in their several departments.

† The structure of the antennæ and some other parts, however, differ from those of the perfect insect.

crust, through which the finest seeds vegetate, and without which the entire surface would be blown away. The cow-dung is taken fresh from the cow house. (*Gardener's Magazine*, and London's *Encyclopædia of Horticulture*.)

That with many bulbous plants the gardeners of this country have little or no success is obviously owing to one of the following causes. They do not expose the plants when growing to a sufficient quantity of light, keeping them in badly lighted greenhouses or frames, or in the windows of dwelling-houses; or if they do expose them freely to light, they do not protect them with sufficient care from the effects of nightly frosts, by which the leaves become injured and unhealthy. Thus Guernsey lilies (*Narcissus arvensis*) seldom flower in our gardens the second year, although they may have blossomed finely the first year of their importation. The reason is, that the first flowers exhaust the bulbs, and the leaves appear so late in the season, that between the short and gloomy days of autumn and the ill-lighted greenhouses in which such plants are kept, they are unable to prepare a supply of food sufficient to replace that which the first year's flowers consumed, and consequently flowers in the second year are either not formed at all, or if formed, cannot be developed. Mr Knight put these principles to the test by stimulating Guernsey lilies into vegetation sufficiently early for their leaves to enjoy the full influence of the summer's sun; and he found that bulbs so treated flourished well the second as the first year. Another cause is our not attending enough to the nature of the soil in which bulbs are grown. It should be always remembered that their roots desire to be cool, succulent, but very absorbent; and that if the soil is retentive of moisture, they will not only become gorged with fluid, and consequently unhealthy, but the nutritive matter which they contain will be so much thinned as to be less fit for the food of the young leaves. This is doubtless the reason why the Dutch are so careful to select the lightest soil they can find, and, for the fluid necessary to support the growing plants, they trust to the watery stratum which is found some distance, from 9 inches to 2 feet, below the station of the bulbs themselves.

As bulbs are very much cultivated in this country in glasses of water for the ornament of sitting-rooms, the manner in which they can be most successfully treated under such circumstances deserves a brief notice. It has been already stated that if bulbs are placed in contact with water they are liable to rot; it is consequently desirable that the water into which they are to be plunged be at least an inch below their bases. To enable them to hear their leaves and flowers with vigour, they should be abundantly furnished with roots, and the should have been secured for some short time before the stems and leaves are allowed to grow. But as the leaves are easily excited by light and warmth it will frequently happen when bulbs are placed in water glasses in sitting-rooms, that the roots are formed before the stems, and that the flowering is consequently weak and imperfect. To prevent this, it is desirable always to commence the forcing of bulbs by placing them in a damp corner of a cellar where there is just warmth enough, to excite them into growth; in such a situation the roots will start out freely, but the leaves will remain at rest. After the roots are sufficiently formed, the glasses may be gradually removed into the light, and the leaves and flowering stem will then be developed with great vigour. After this there is nothing to guard against except too much heat and too great an absence of light; the former will cause the leaves to grow too rapidly, and to become what is technically called *draught*, unless a much larger quantity of direct solar light is permitted to act upon them than we can have the opportunity of procuring in the months when bulbs are forced. They should therefore be kept in a south window in a cool room, and never removed to the interior of the apartment until their flowers are nearly a mold.

We have only to add a word or two upon the propagation of bulbs. They generally multiply by forming *cloves* in the axils of their scales; such cloves or young bulbs are in reality buds, and one such must exist in a rudimentary state at the base of every scale [*bract*]. But it is only in a few species—that more than two or three develop; in the common earlie a larger number than usual is constantly produced. When the number naturally developed is small, the multiplication of a new variety would be very slow if left to the unassisted efforts of the parent plant; a little simple application of the principles of vegetable physiology

shows however the manner of increasing the number of cloves. The principal reason why bulbs such as hyacinths, for instance, produce only two or three cloves is, that the powers of development inherent in the axillary buds cannot be called into action because of the exhaustion produced by the formation of a fine flowering stem; if this be prevented, that sap which would otherwise be consumed by the flowers is directed into the axillary buds, which then become cloves or young bulbs in much larger numbers than otherwise. Consequently the destruction of the flowering stem when quite young is the most effectual mode of forcing the bulb to produce young ones.

BULGARIA, a province of European Turkey, now included in the Ejalet of Rum-ili. [*Rum-ili*.]

BULIMIA (*Bulimia*), canine appetite, insatiable desire for food. The statement of the quantities of food consumed by some persons labouring under this disease is scarcely credible, yet it rests on testimony the veracity of which there is no reason to question. In the third volume of the '*Medical and Physical Journal*' an account is given, by Dr. Cochrane of Liverpool, of a man, placed under his own personal inspection, who, in one day, consumed, of raw cow sudder, 4 pounds, raw beef 10 pounds, candles 2 pounds, in all 16 pounds, besides 5 bottles of porter. M. Percy, a surgeon-in-chief to the French army, made a report to the National Institute of the case of a soldier who was in the constant habit of devouring enormous quantities of broken victuals, basket-ful of fruits, and even living animals; the details given of the quality as well as of the quantity of articles consumed by this man, without ever satisfying his voracious appetite, are too disgusting to be related. Dr. Copland gives in account of two cases of this disease, which occurred in his own practice in children, one seven years of age and the other nine. In both these, but in the younger especially, the quantity of food devoured was astonishing. Everything that could be laid hold of, even in its raw state, was seized upon most greedily. Besides other articles an uncooked rabbit, half a pound of candles, and some butter, were taken at one time. The mother stated that this little girl, who was apparently in good health otherwise, took more food, if she could possibly obtain it, than the rest of her family, consisting of six besides herself. In both this and the other case the digestion seemed to be good. A rancorous smell emanated from the bodies. These children, who were both very intelligent, complained of no other uneasiness than a constant gnawing or craving at the pit of the stomach, which was never altogether allayed, but which, shortly after a meal, impelled them irresistibly to devour everything that came in their way, however disgusting.

The real nature of the morbid condition of the stomach and of the system in this disease is very imperfectly known. In several cases the health in other respects has appeared good, but in most cases there has been evident disease in various organs, and death has usually taken place at an early age. On the examination of the body after death the stomach has commonly been found enormously distended and sometimes misplaced: the duodenum and the rest of the intestines are usually in the same state of distension; the coats of all these organs are commonly thickened, and the valvula conniventes (the folds of the finer or mucous membrane of the intestines) as large as in carnivorous animals. Various organic changes have at the same time been found in the mesentery and its glands, as well as in the liver, the pancreas and the spleen.

There can be no question that most cases of this disease might be greatly mitigated, if not wholly removed, by the firm and constant restriction of the food to that quantity only which the wants of the system really require. Unless the individual have strength of mind to submit to the necessary privation, or unless, in the case of children, a steady and undeviating restraint be imposed, every attempt to remedy the evil will be vain. If a rigid regulation of the diet be enforced, the cure will be materially assisted by a course of nauseating purgatives, as oil of turpentine rendered more agreeable by castor oil. Several cases of great intensity have been completely cured by a steady treatment conducted on these principles.

When moderate appetite is merely the result of some other unusual or morbid condition of the system, that is, when it is what is called symptomatic; when, as is often the case, it is the consequence of great fatigue, or of mania, or of long-continued acute disease, or of some malady attended with an extraordinary degree of secretion and ex-

cretion, and therefore with the removal from the system of a proportionate quantity of its nutrient matter, the disease can be cured only by the restoration of the system to its ordinary and sound state.

BULIMULUS, Leach's name for a genus of terrestrial molluscs, which he thus defines:—Shell univalve, free, conically acuminate; spire elevated, regular; the last whorl very large; mouth entire, long; pillar smooth, simple; external lip thin; internal lip inflected towards the middle, with a hollow beneath. To this generic character the Rev. Lansdown Guilding observes that there should be the following addition: 'Tentacula 4, the two upper ones long with terminal eyes: no operculum.' The last named author observes that it differs from *Bulinus* in the delicacy of its outer lip. It is indeed a *Bulinus* of Lamarck. [*BULIMUS*.]

Leach observes that *Bulimulus trifasciatus* (*Bulinus Guadalupeensis*, Brug.), a very common existing West Indian species, occurs embedded in the same limestone which incloses the fossil human skeleton from the *Grande Terre* of Guadeloupe, now in the British Museum. 'Several skeletons of men,' says Lyell (in the 3rd vol. of his 'Principles of Geology,' p. 190, last edit.) 'more or less mutilated, have been found in the West Indies, on the north-west coast of the main land of Guadeloupe, in a kind of rock which is known to be forming daily, and which consists of minute fragments of shells and corals, incrustated with a calcareous cement resembling travertine, by which also the different grains are bound together. The lens shows that some of the fragments of coral composing this stone still retain the same red colour which is seen in the parts of living coral which surround the island. The shells belong to the neighbouring sea, intermixed with some terrestrial kinds, which now live on the island, and among them is *Bulinus Guadalupeensis*.' There is another human skeleton from the same rock in the Museum at Paris. Mr. König has published an interesting paper on the skeleton in the British Museum in the 'Philosophical Transactions.'

[*Bulimulus trifasciatus* 1]

BULINUS or **BULIMUS**, the name of a very extensive genus of terrestrial pulmoniferous molluscs. Lamarck arranges it under his *Colimaies*, a family of phytophagous or plant-eating trachelipods, respiring air by means of lungs, and protected by a spiral shell which is more or less elongated, oval, oblong, or turriculated, with an entire aperture longer than it is wide, and with a very unequal border, which is reflected in the adult. The columella is smooth, without any notch or truncation at the base, but with an inflexion in the middle at its point of junction with that part of the peristome which it contributes to form. De Blainville places it under the *Limacina*, his third family of Pulmobranchiata, whose organs of respiration are retiform, and line the cavity situated obliquely from left to right upon the origin of the back of the animal, communicating with the ambient air by means of a small rounded orifice in the right side of the border of the mantle. Some of the species were placed by Linnæus under his genera *Bulla* and *Helix*. Scopoli and Bruguières began the reform, and Lamarck carried it still further. But before we proceed, it may be necessary to say a word as to the origin of the term used to designate the genus. 'We constantly hear,' says Broderip, in the 4th volume of the Zoological Journal, 'among conchologists the question, what is the meaning of *Bulinus*?' The author of the article entitled Lamarck's Genera of Shells, in the 15th volume of the Journal of Science, thus derives the word '*Βούλιμος*, insatiable hunger—what title this genus has to so strange a name we know not.' It may not then be unacceptable to give a plain statement of the origin of the word. Swainson observes (*Zool. Illustr.*, vol. i, *Bulinus Melaschomus*) that 'the genus *Bulinus* was long ago formed by Scopoli, out of the heterogeneous mixture of shells thrown together in the Linnæan genus *Helix*.' Let us now turn to Scopoli's account of the source whence he derived the name. 'Proprium,' says Scopoli, 'itaque ex his constituo et duce celeberrimo Adansonio *Bulinus* voco,

ut eo facilius agnoscantur. Solam festam nec animal inhabitans vidi, quod diversam esse à *Limacina* affirmat Adansoni.' (*Delicæ*, &c., p. 67.) Now Adanson has no such genus as *Bulinus*, but he has such a genus as *Bulirus*. At plate 1, fig. G 2, in his Natural History of Senegal, will be found '*Le Bulm, Bulirus*,' but the letters '*n*' and '*u*' are so confusedly engraven, that, at first sight, the word looks like *Bulinus*. In the text (p. 5), the word is printed *Bulirus* very plainly; but neither Scopoli nor any of his successors appear to have noticed it. Till the time of Lamarck, who confined the genus (still calling it *Bulirus*, after Scopoli and Bruguières) to the land-shells with a reflected lip, which now range under it, many land and fresh-water shells which have not a reflected lip, such as *Achatina*, *Physa*, *Limacæ*, and *Succinea*, were also congregated under the name of *Bulirus*. The *Bulirus* of Adanson was a fresh-water shell, apparently a *Physa* or *Limacæ*.

The shell is never orbicular, as in the *Helix*, but of the shape noticed at the commencement of the article, the last whorl is always larger than the penultimate, and, indeed, as a general rule, may be stated to be larger than all the others put together. The mouth of opening is an oval oblong, and the border is decimated. The adult reflected lip or border on the right side is generally very thick, but this reflection is sometimes absent. The animal is very like that of *Helix*: De Blainville says entirely so (*that a fact semblable*). The head is furnished with four tentacles or horns, the two largest of which are terminated by the so-called eyes. There is no true operculum. The geographical distribution of the genus is very general, and there is scarcely a part of the world where the form does not occur. The great development of it takes place in the warmer climates, where some of the species are very large.

The reproduction is by means of eggs, which are white and have a film shell like those of birds: some of these eggs are of considerable size. The *Bulim* are unisexuous, true hermaphrodites (*Paraphelophora munda* of De Blainville), both the sexual organs being distinct, but existing in the same individual, and requiring the union of two for the continuation of the species. Three eggs were laid by one of the species, *Bulirus ovalis*, from Rio in a hot house in the garden of the Horticultural Society at Chiswick. It was brought over in October, 1828, by Mr. William McCall, then gardener to the Right Hon. Robert Gordon, and presented by him to the Society. At first it appeared rather sickly, but after it had been kept in the hot house for some time, it recovered and began to move about. Mr. Boett, who was of the spot, says, 'It cannot now be correctly ascertained when it produced the first egg, but it was very shortly after its arrival. I should think about the beginning of November. This egg was sent, by the desire of Mr. Sabine, to the Zoological Society. About the same time this year (1829), it produced a second egg, and, three weeks afterwards, a third: the latter was unfortunately broken by the animal itself, but the former is still in preservation. It fed upon lettuce, and the tender leaves of cabbages: the former seemed to be its favourite food. Sometimes it would devour two large lettuces, and then remain for days afterwards without touching food or moving from its place, except when cold water was sprinkled upon it. During the day it was usually in a dormant state in the shade; but towards the evening, when the house was moist and warm, it would spread itself out, and move from one part to another. It seemed to like moisture, and I have no doubt that it might have been preserved for years, if it had not been accidentally killed. On Saturday last it was at the end of the house where the fire comes in, and ventured too far upon the hot bricks after they had been watered. In the morning it was found fixed to them and quite dead.' *Bulirus ovalis*, though it a good deal resembles *Bulirus hamostoma*, which is here figured, is considerably larger.

The species are multitudinous. Mr. Cuming lately brought home numbers of new ones from South America, and we are indebted to that gentleman, who has just departed on another voyage which has for its object the collection of subjects of natural history, for the following account of the habits of *Bulirus rosaceus*. In the dry season he always found the animals adhering to the under side of stones, generally among bushes, and close at the edge of the sea-shore, within reach of the spray at times. On the hills, about 1000 feet above the sea, they were observed ad-

* The shell varies much in colour.

* Zoological Journal, vol. v. p. 102.

nering between the lower leaves of an aloe-like plant, on the honey of whose flowers the giant humming-bird (*Trochilus Gigas*) feeds. The natives burn down clumps of these plants for the sake of the rings at the bottom of the footstalks of the leaves, which they use for buoys for their fishing nets and for baking the coarse earthenware which they make on the hills, because this part of the plant, when ignited, throws out a great heat. Between these leaves the Bulini lie, in the dry season, in a torpid state. In the spring (the months of September and October), they burrow in the shady places at the roots of this plant, and among the bushes on the sea-shore. At this period (the spring), they lay their eggs in the earth, about two inches below the surface. Mr. Cuming never saw them crawling

about. In the dry season they were evidently hibernating, for their parchment-like secretion, which operates in place of an operculum to seal up the animal, was strongly formed, and they stuck to the stones so tenaciously that Mr. Cuming broke many of them in endeavouring to pull them off. Chili and the neighbouring coasts of South America generally were the localities where the species was taken. Captain Phillip Parker King, R.N., who described the species in the *Zoological Journal*,* has the following notice of the power of the animal to exist in a dormant state:—'Soon after the return of the expedition (His Majesty's ships *Adventure* and *Beagle*,—*Survey*, 1826—30), my friend Mr. Broderip, to whose inspection Lieutenant Graves had submitted his collection, observing symptoms of life in some of

[*Bulinus Helicostoma*, nat. size.]

a, the egg; b, the egg-shell broken, showing the young animal with its shell in situ; c, the shell of a young one just after exclusion from the egg; d, the shell at an advanced age, but before the lip is reflected; e, the adult shell. The specimens figured were brought from Trinidad. It is found

in the brakes of St Vincent's and of the Antilles generally.† The young shell is semitransparent, but becomes opaque as it advances in age. The adult shell is brown, strongly striated or wrinkled longitudinally, with a rose-coloured mouth. Epidermis brown.

[*Bulinus rosaceus*, nat. size.]

a, an adult, with the animal as it is seen when in motion; b, a young shell before the lip is reflected. The mouth is represented as sealed with the parchment-like secretion, which serves as an operculum when the animal is hibernating; c, egg-shell broken, discovering the infant shell; d, egg unbroken. Figure a was taken from one of the specimens mentioned above when living in this country. Adult shell roughish; apex and upper whorls of

a rose colour in fine specimens; the other whorls brownish, mottled longitudinally in fine specimens with dirty white. Suture crenulated; lip white; throat brownish; epidermis greenish.

* Vol. v. p. 342.

† The Rev. Laurens Gilling adds *Argentinæ America*.

the shells of this species, took means for reviving the inhabitants from their dormant state, and succeeded. After they had protruded their bodies, they were placed upon some green leaves (cabbage), which they fastened upon and ate greedily. These animals had been in this state for seventeen or eighteen months; and five months subsequently another was found alive in my collection, so that the last has been nearly two years dormant. These shells were sent to Mr. Loddiges's nursery, where they lived for eight months in the palm house, when they unfortunately died within a few days of each other. Soon after the shells were first deposited at Mr. Loddiges's, one got away and escaped detection for several months, until it was at last discovered in a state of hybernation: it was removed to the place where the others were kept, when it died also. The upper surface of the animal, when in health, is variegated with ruddy spots and streaks on an ash-coloured ground.* The only process used for revivifying these animals was placing them on a plate near a moderate fire, and sprinkling them with tepid water. Upon their restoration, they ate a considerable part of the parchment-like seal or operculum. They lived some time with Mr. Broderip before they were sent to Messrs. Loddiges. These animals had been packed up in a box and enveloped in cotton from the time of their capture to the period mentioned, when they were unpacked by Mr. Broderip. Lyell notices this circumstance when treating on the geographical distribution of testacea, in the third volume of his *Principles of Geology*.*

[*Bulinus lubricus*]

and *b.* magnified. Inhabits Northern Europe, and is common in the neighbourhood of Paris. Shell smooth, shining, of a horn colour, inclining to fulvous, transparent.

FOSSIL BULINI.

Dehayes, in his tables (see Lyell's *Principles of Geology*, vol. iii. Appendix I. pp. 18 and 19; N.B. these tables are not printed in the last edition), enumerates three fossil species of Bulini in the tertiary formation, one of which is known to him from the sub-Apeninæ beds, and another from Paris, but he does not give the locality of the third, nor does he identify any of the fossils with recent species. De la Beche, in his geological manual, under the head of Fossil Shells, contained in the supracretaceous rocks of Bordeaux and Dax, enumerated by M. de Basterot, has the following notice: '*Bulimus? terebellatus*, Lam., analogous to the existing species, Grignon, Placentine, Dax.' Lamarck (*Animaux sans Vertèbres*, vol. vii. p. 534) describes the shell of *Bulimus terebellatus*, a Grignon fossil, as two centimeters in length, and observes on the singularity of its mouth or opening, but he makes no allusion to its resemblance to any existing species. In the *Annales du Muséum*, he places it among the *Bulmi* with doubt, observing that it may, from its conformation, be probably marine, but keeping that generic name for it, because it approaches nearer to the *Bulmi* than to any other known genus. In the seventh volume of his *Animaux sans Vertèbres*, published eighteen years afterwards, he still arranges it among the *Bulmi*, and not under the head of 'doubtful species.' The fifteen species described by Lamarck in this volume are all stated to be fossil, and only the five last are separated as *Espèces douteuses*. Of the not doubtful species, *Bulimus sextonus*, found fossil at Villiers and Grignon, bears a great resemblance, according to the author, to *Bulinus lubricus*; but he observes that the opening or mouth of the fossil shell is much shorter than that of the recent, and that the summit of its spire is less obtuse. It may be doubted whether even the ten first fossil species enumerated by Lamarck are all true *Bulini*. De Blainville quotes Defrance for thirty-seven fossil species.† [HÆLIX.]

* Vol. iii. p. 6, last edit., 1821.

† For the subdivisions according to the form of the shell, see De Perussac's great work (*Cochlogonia*, &c.). De Blainville, in his 'Additions and Corrections,' quotes the genus *Balen* of Pridmore and Gray for one of his divisions of *Bulmar* (the reversed or left-handed species with the opening pointed at the two extremities) and gives *Bulimus ciliatus* as an example; but the type of the genus *Balen* is *Pupa fragilis* of Draparnaud.

BULL. [Ox.]

BULL, GEORGE, was born in the city of Wells, on the 25th of March, 1634: he received the first part of his education at the grammar-school of Wells, from which he was removed to the free school of Tiverton, in Devonshire, then superintended by Mr. Samuel Butler, who is reported to have had an excellent method of teaching. At fourteen he was admitted a commoner of Exeter College, Oxford; but, in the following year, on refusal to swear to the engagement, 'That he would be true and faithful to the Commonwealth of England, as it was then established without a King, or House of Lords,' he retired, with his tutor, Mr. Ackland, and several others, to North Cadbury, in Somersetshire, where he prosecuted his studies until his nineteenth year. By persuasion of his friends he now went to reside with Mr. William Thomas, a Presbyterian divine, from whom he derived little or no assistance in the study of divinity. This residence however brought him into intimate acquaintance with Mr. Thomas's son, who directed his reading, and supplied him with the writings of Hooker, Hammond, Taylor, &c. Mr. Bull was irregularly ordained, at the age of 21, by Dr. Skinner, ejected bishop of Oxford, at a time when it was 'criminal for a Bishop to confer holy orders.' His professional duties commenced in the parish of St George, near Bristol. In 1658 he obtained the living of Suddington St. Mary near Bristol, where he became privy to an unsuccessful scheme of a general insurrection in favour of the exiled family, his house being one of the points of meeting. After the Restoration he was presented by Lord Chancellor Charendon to the vicarage of Suddington St. Peter. These preferments he retained until 1685, having distinguished himself by his zeal, judgment, and charity, on all occasions. In 1669 he published, in Latin, his '*Harmonia Apostolica*.' In the words of his biographer, Nelson, 'There having been, during the unhappy times of the great rebellion, a vast multitude of books written upon the subject of Justification, by the hot men of the several parties, some of whom in treating of it leaned too much to Popery or Judaism, others to Antinomianism and Liberalism, some again to Pelagianism and Socinianism, and others, lastly, to Machiavellism and Fatalism, all very dangerous errors; and abundance of learned sophistry having been used in perplexing the plain and natural sense of the divinely inspired writers; and several hypotheses moreover invented purely to serve a turn, which did but the more still obscure what they pretended to clear up, and set at a wider distance those whom they laboured to reconcile by their strained and metaphysical subtleties: they not only disagreeing about what was meant by justification, but even by faith and by works, and indeed about every term that is made use of either by St. Paul or by St. James when they speak to this point: and so feigning one apostle to write concerning a first, and the other concerning a second justification, or else one concerning a justification before men only, and the other concerning the same before God; one concerning a true, the other concerning a false faith, with a multitude of other groundless inventions, utterly foreign to the minds of both the said apostles; and many foolish contests having been started about words, that could have no other end but to raise a dust, there could nothing come forth more seasonably, if well done, than a treatise of this nature.' The object of this book, which consists of two parts, or dissertations, was to explain and defend, first, the doctrine of St. James, and, in the second, to demonstrate the agreement with him of St. Paul; it being more particularly his aim, in the first dissertation, to show, 'That good works, which proceed from faith, and are conjoined with faith, are a necessary condition required from us by God, to the end that by the New Evangelical Covenant, obtained by and sealed in the blood of Christ, the mediator of it, we may be justified according to his free and unmerited grace.' In the second, 'having in the first place established this one point for his foundation—That St. Paul is to be interpreted by St. James, and not St. James by St. Paul, in consent with many of the ancients, (and particularly of St. Augustine himself,) who are of the opinion that the General Epistle of St. James, the first of St. John, and the second of St. Peter, with that of St. Jude, were written, against those who, by misinterpreting St. Paul's Epistles, had imbibed a fond notion, as if faith without works were sufficient to save them: he sheweth whence this obscurity and ambiguity in the terms of St. Paul might probably arise, which was the occasion that persons not well-grounded came to mistake or pervert the same.' Bull

proves, that, where St. Paul speaks of justification by faith, he intends the whole condition of the Gospel-covenant; that the faith required implies obedience; that it cannot be separated from obedience; and that obedience is made necessary to justification. The publication raised much dispute among divines. The first open antagonist was Mr. John Truman, a Non-conformist minister. Dr. Morley, bishop of Winchester, and Dr. Barker, the one from the divinity chair at Oxford, and the other, in a charge to his clergy, forbade the reading of the book, as a rash intrusion into things too high for such discussion. Though, for a while, much prejudice was excited against our author, yet, when he published his answer entitled 'Examen Censurae,' and his 'Apologia,' his reputation increased, and the soundness of his view was generally acknowledged. In testimony of his merit in this particular instance, Lord Chancellor Finch presented him to a prebend in the church of Gloucester. In 1685 he published his 'Confessio Fidei Nicenae,' a work directed against the Arians and Socinians, and Sabellians and Trinitarians, by which he gained great celebrity both at home and abroad. In the same year in which he was preferred in Gloucester Cathedral, 1678, he received the rectory of Avening in Gloucestershire, from Philip Shepherd, Esq.; and in the next year he was installed archdeacon of Llandaff, on the nomination of archbishop Sancroft, and about the same time was complimented with the degree of doctor of divinity by the University of Oxford, for the service he had rendered the church in his 'Defensio Fidei Nicenae.' In 1691 he published his 'Judicium Ecclesiae Catholicae,' in vindication of the Anathema, as in his 'Defensio' he had vindicated the faith established at the council of Nice, against Episcopius. For this publication the thanks of the whole clergy of France were transmitted to him through Bossuet, bishop of Meaux. His last work, published before his death, was his 'Primitive and Apostolical Tradition, &c.' in which he proved, against Daniel Zucker, that the pre-existence and divine nature of our Lord was an apostolical doctrine. In 1701 he was nominated to the bishopric of St. David's, a promotion which he at first declined, alleging his years and infirmities; but at length he gave a reluctant consent, and was consecrated at Lambeth on the 29th of April, 1705. His conduct as a bishop, as well in the House of Lords as in his diocese, was such as to justify a belief that, had he been earlier advanced to that dignity, he would have been of signal use. Close application to study had impaired his health, and he expired on the 17th of February, 1709, and was buried at Brecknock. After his death his sermons were published by his only surviving son, in compliance with his directions. Perhaps no sermons have more of a primitive character than those of Bishop Bull; none more clearly discriminate between primitive doctrine and modern error. Their great aim is to infuse into the hearts of Christians right apprehensions of the doctrines of Christianity, and therefore he deduceth them from Scripture, and the purest ages of the church; and at the same time endeavours to make such an impression upon their minds that they might pursue their duty with some warmth, which he doth with so much more authority by how much it appeareth that he was affected himself with what he delivered to others. Several tracts which it is said cost him much labour, were lost by his own neglect. His works, with a copious account of his life and writings, were published by Robert Nelson, Esq. His Latin works were collected, during his lifetime, into one volume folio, by Dr. Grabe. (Nelson, and *Biographia Britannica*.)

BULL-DOG. [Dog]

BULL-FIGHTS, a very antient and barbarous amusement, which, under different modifications, has descended to modern times, and is found in many of the countries of Europe, though the English form of it (bull-baiting) may almost be said to have gone out of fashion.

Bull-fights were known to the antient Egyptians; and also to the Greeks more than 300 years before Christ. The Thessalians had their regular festivals or days of bull-fighting. As the Thessalians were celebrated for their skill in horsemanship, it is probable their combats resembled those of the Spaniards, the most celebrated of modern bull-fighters, and the only European people that have preserved the sport in its perfection. The bull-fight, as we understand it, was not included in the games of the Roman amphitheatres. It appears to have been common among the Moors, who are generally said to have introduced it with the djerid and other equestrian and warlike sports into Spain in the eighth

century. Though disgusting from the quantity of blood of bulls, horses, and men that frequently flows in the arena, a true Spanish bull-fight, like those exhibited at Madrid, Seville, Cadiz, and the great cities of the south, is a gallant and imposing spectacle. It has often been described in prose and verse. In the first canto of Lord Byron's *Childe Harold*, there is a description of one at Cadiz, which is not more poetical than it is correct. A few words in plain prose may convey some notion of the game, to which Spaniards of both sexes and of all ranks are passionately attached.

The amphitheatre, or plaza de toros, in the great cities, is an extensive edifice partly built of stone and partly of wood. It is open at top, with seats running round it and rising above each other, and is capable of accommodating from 5000 to 10,000 spectators. The lower tier of seats is protected by a parapet, in front of which a very strong wooden fence, about 6 feet high, is erected; this fence runs (like the seats) all round the arena, at the distance of from 12 to 20 feet from the lowest tier of seats. The ground-plan of the plaza thus describes two circles, No. 1, or the inner circle, being

the battle-ground, and No. 2, or the outer circle, being the place where the men on foot take shelter when hard pressed by the bull. To allow of the latter movement, openings just large enough to admit a man sideways are made in the strong fence which separates the two circles.

The actors on the arena are, first, the bull, which ought to be of the fierce Andalusian breed; second, the picadores, or men who attack the bull on horseback; third, the banderilleros, who attend on the picadores, and are armed with sharp goads furnished with coloured streamers; fourth, the chulos, or men with glaring coloured cloaks, with which they distract the bull's attention; and fifth, the matador, who directs most of the movements, gives the bull his finishing stroke, and who, in reality, may be considered as the chief performer. Each matador, as well as each picador, has generally two chulos attached to his person. When all is ready, there is a flourish of trumpets; then the picadores with lances in rest caracole within the barricade, and the banderilleros and chulos, in their old Spanish and bespangled dresses, step lightly into the arena. The trumpets sound again—the combatants take up their places, and all is quiet in the amphitheatre. Another flourish, and the bolts of the bull-stall are withdrawn, the gate in the barrier is thrown open, and the spectators shout *El toro!* (the bull!) who, if he be a good one, gets into the midst of the arena at a single bound. The picadores await his furious onset, their object being to wound him with the lance, and then give him the go-by, avoiding the shock of his charge, which is sometimes fatal both to man and horse. Generally speaking, however, the Andalusian horses used for the sport are thoroughly well in hand, and on their haunches, turning most nimbly on their hind legs; and the men, by long practice, have such sure eyes and hands, and are altogether so adroit, that any serious misfortune is to be looked upon rather as an accident than as an ordinary result. When any picador is closely pressed, the footmen, both banderilleros and chulos, rush to his assistance, and, by pricking him with their darts, and waving their red, scarlet, and yellow scarfs before his eyes, nearly always succeed in drawing off the bull's attention. These attacks and defences are repeated until successive wounds from the lance and the shorter goads of the banderilleros cause the poor bull's flanks and shoulders to stream with blood. At first these wounds madden him, but the loss of blood and his furious exertions gradually weaken and dispirit him. In most approved bull-fights, at a certain stage, the picadores or horsemen withdraw, and leave the combat to the banderilleros, each of whom carries a banderilla or goad, about two feet long, ornamented with a pennant, in each of his hands, but no cloak or dazzling scarf of any kind on his arm. Thus armed, the banderillero runs up to the bull, and stopping short when he sees the animal's head lowered to attack him, he fixes the two shafts, without flinging them, behind the horns of the bull, at the very moment that it is preparing to toss him. The pain thus occasioned makes the bull throw back his head and lose his blow, on which

the nimble-footed banderillero retreats, one of his comrades comes up to the charge, or a chulo throws a cloak over the bull's horns, and so, by blinding it, prevents the renewal of the combat for some seconds. Should the banderillero fail in fixing his darts, and should the bull be still froth, he must rush to one of the openings left in the wooden fence, and creep into the outer circle. The nimblest of the banderilleros, instead of seeking the opening, which may be too distant for them to make in face of the bull's horns, will lay their hands on the top of the fence and spring over it; and a fine bull of the true breed has sometimes been known to go over after them, clearing the six-foot fence as an English hunter takes a five-bar gate.

At length, bellows of rage and pain, and his wavering, uncertain onsets, show that the poor bull's death is near. Then a great man in the privileged government boxes waves his handkerchief, and another flourish of trumpets gives the signal to the matador to come forward and do his last office. Followed by some chulos as auxiliaries and assistants, the matador advances with a red mantle, or a piece of red cloth attached to a short handle, in his left hand, and a long well-proved sword in his right. He first of all drops on one knee in front of the royal or government box, doffs his cap, asks permission to finish the affair, draws his arm across his breast to the right and left, throws down his cap as a pledge that he must redeem, and then rises to do his work. The perfection of his performance consists in this—he must wait the bull's charge, his person being partially, and his toledo blade wholly, concealed behind the extended cloak, and he must so receive the bull on its point that the sword shall penetrate up to the hilt in that particular part of the animal where neck and shoulders meet. When this happens, the bull staggers for a second or two, and then drops in the midst of the enthusiastic shouts of men, women, and children. As soon as the bull is dead, and sometimes before, another blast of trumpets is heard, and four powerful and richly caparisoned mules, with large bells round their necks and harnessed a-breast, trot into the arena. Their traces are hooked to a cross bar, which is attached to the bull's horns; trumpets are sounded and hands clapped, and away gallop the mules, bull and all. The barriers are again closed, and the lists ready for another exhibition of torture and blood. (See a very graphic account in *Madrid* in 1835; see also Doblado's *Letters from Spain*, and Townsend's very accurate and lively *Travels in Spain*.)

BULL-FROG. [Frog.]

BULLACE, the English name of a kind of plum, the *prunus insititia* of botanists. It is probably a mere variety of the sloe.

BULLADÆ, a family of marine mollusks, which authors seem to agree in placing in the vicinity of *Aplysia* or *Laplysia*, as it is more generally but erroneously written. Thus Lamarck arranges it among his Gasteropoda, between the Calyptracians on one side and the Laplysians on the other, making the family to consist of the three following genera, *Acera* or *Akera*, *Bullæa*, and *Bulla*. Cuvier finds a situation for it in his fourth order of Gasteropoda, the Tectibranchians (Monopleurobranchians of De Blainville), which includes both *Aplysia* and *Umbrella*. De Blainville places it next but one to his Aplysians (his family *Patelloidea* intervening) under the family *Akera*, the fourth of his third order (*Monopleurobranchiata*), of his second subclass (*Paracephalophora Monoca*), of his second class (*Paracephalophora*.)

Lamarck's *Acera* and De Blainville's *Lobaria* are identical.

LOBARIA.

Body oval-oblong, subglobular, appearing to be divided into four parts: one anterior for the head and thorax, one on each side for the natatory appendages or fins, and one posterior for the viscera. The anterior fleshy disk terminates in an approach to a point near the middle of the body; the branchiae covered by the mantle are so posterior that they seem to be almost at the extremity of the body, and below them would be the analogous situation for the shell, of which there is not even a rudimentary trace. *Acera carnea*, Lam.; *Bulla carnea*, Cuv.; *Lobaria carnea*, Blainv., an European species, is the only example known; but De Blainville observes that it may perhaps approach the small incompletely known mollusk on which MM. Quoy and Gaimard have founded their genus *Triptère*, and which is figured in the atlas of the voyage of the *Uranie*. Rang considers this opinion to be erroneous, for he declares that

the *Triptère* of Quoy and Gaimard evidently belongs to the genus *Cleodora*.

[*Lobaria carnea*.]

BULLÆA.

Lamarck assigned this name to those of the family which have the shell entirely hidden in the substance of the mantle. This shell is very open and delicate, and can hardly be said to have more than the first rudiment of the rolled-up form which is in *Bulla* carried to greater perfection. *Bullæa aperta*, Lam. (*Bullæa Planciana*, Lam. in the early edition of the *Syst. des Anim. sans Vert.*) *Amigdala marina* (Amande de mer), Planc., *Bulla aperta*, Lam., *Bulla aperta* and *Lobaria quadriloba* of Gmelin, which is found in almost all seas, generally on sandy bottoms, will serve for an example. The animal is whitish, more than an inch in length, and, as Cuvier observes, the fleshy shield formed by the vestiges of the Tentacula, the lateral borders of the foot, and the mantle occupied by the shell, seem to divide it into four portions, whence Gmelin's term *quadriloba*. The shell is delicate, white, semitransparent, and consists almost entirely of aperture. The stomach or gizzard is armed with three very thick rhomboidal bones or rather shelly pieces.

[*Bullæa aperta*.]

Fig. 1, view of the back; 2, side view, the right; 3, the same, but the central fleshy plate separated from the dorsal to show the parts beneath; 4, view of the under side; a, the fleshy plate which covers the anterior part of the body; b, the fleshy plate that acts as a foot; c, the part which contains the shell; d, a part of the branchium; e, the vent; f, the common orifice of the tentacle and oviduct; g, shell in its natural position; h, view of the under side.

Bullæa has been found at a depth ranging from near the surface to 12 fathoms. Mr. W. Clark found three English species, two of them (*Bullæa catena* and *B. punctata*) at Exmouth and Torquay in pools at the time of the lowest spring tides; and a third (*Bullæa pruinosa*) by dredging off Budleigh Salterton. The depth is not mentioned, but it is probable that it was considerable, for the author says that it is rare, and only occasionally to be procured by deep dredging seven or eight miles from the shore. The first of Mr. Clark's species, which is *Bulla catena* of Montagu, had a testaceous gizzard, but the gizzards of the other two were unfurnished with shelly appendages. (See Mr. Clark's description, *Zool. Journ.* vol. iii. p. 337.) G. Sowerby, when speaking of the use of the shelly pieces and their powerful adductor muscles, states that the animal of *Bullæa aperta* is sometimes distorted by having swallowed entire a *corbula*

nucleus, which is a very thick and strong shell, nearly equal in size to itself.

De Blainville says of this genus that he characterises it somewhat differently from Lamarck, who established it, and who only places under it the *Acères* (*Acerata*), whose shell is internal; but as De Blainville considers the animal to be of the first consequence, he distinguishes under the name of *Bullæa* those species which, whether their shell be external or internal, have the foot thickest and not dilated into natatory appendages, having, in fact, habits different from the *Bullæ*, according to his acceptation of the term, which swim very well and creep very badly. He divides *Bullæa* into

1st. Those species which have an internal shell very incompletely rolled up without spire or columella, and selects as his example *Bullæa aperta*, the species figured above.

2nd. Those species whose shell is internal and very incompletely rolled up, with a columella and alveolar spire (*spire rentrée*), and gives as an example *Bulla ampulla*.

3rd. Species whose shell is internal, the lateral lobes cirrhus and more developed, and gives as an example Ferussac's *Bullæa* (Quoy et Gaimard), here figured from the Atlas Zoologique of the voyage of the Uranie.

[Ferussac's Bullæa.]

In the 'Additions and Corrections' to his Malacologie, De Blainville says that, in studying more attentively the species of these two genera, it seems to him that the greater part would be better placed under *Bulla* than under *Bullæa*, where he would leave only the species which serves for the type, and another lately brought from the seas of New Holland by Quoy and Gaimard. He then proposes an entirely new arrangement into seven groups represented by the following genera: 1. *Bullina* (*Bulline*) of Ferussac, with a projecting spire (example *Bulla Lajonkairiana*, Bast.) 2. *Aplustre* (Schum.) 3. *Bulla*. 4. *Atys* (Montf.) 5. The form represented by *Bulla fragilis*. 6. *Scaphander* (Montf.), which is *Bulla lignaria*. 7. *Bullæa* (Lam.).

SORMETUS.

Cuvier observes that this form approaches very closely to that of his *Bullæa*, but he adds that he does not find sufficient certainty in the imperfect materials afforded by Adanson, to enable him to found either a genus or even a species on them. De Blainville places it as a genus next to *Lobaria*, but his description and figure are taken from Adanson, and he is obliged to add that it is established upon an animal 'assez incomplètement connu.' We give Adanson's figure, but we do not think any satisfactory inference can be drawn from it as to the position which *Sormetus* should hold among the testaceous mollusca.

[Sormetus Adansonii.]

BULLA.

Besides the true *Bullæa*, the heterogeneous *Bulla* of Linnæus comprised some of the *Physæ* and *Achatinæ*, and of the *Orula*, *Terebella*, *Fyrula*, &c.: in short, the genus comprised animals of entirely different organization; terrestrial and marine testacea—the former breathing air and the latter respiring water—were there placed side by side. Lamarck retains the name (and Cuvier seems to adopt his arrangement) for the species whose shell covered by a slight epidermis is sufficiently large to afford a retreat to the

animal, and is more perfectly rolled up than the shell of *Bullæa*. Lamarck describes the shell of his *Bulla* as completely rolled up (*enroulée*), showing itself constantly uncovered. It is, generally speaking, only partially enveloped by the animal, which can retreat into it almost entirely, has no distinct columella nor any true spire, unless indeed that term be applicable to the apex of *Bulla fragilis*, which we now proceed to describe. Its shell is ovate-oblong, very thin and fragile, of a horn colour, with very small transverse striae, and the apex rises into the rudiment of a projecting spire.

[Bulla fragilis.]

A, the shell showing the aperture. C, a view of the spiral. B, the animal.

Lamarck says that it inhabits the English channel (La Manche), near Nantes and Normoutiers. We now proceed to give an example of those species which while they have a little more solidity than *Bulla fragilis* are still very delicate and fragile in their texture.

[Bulla Velum.]

The shell is very delicate, of a very light horn-colour when in fine condition, with a snow-white band about the middle, bordered on each side with a broad dark-brown one; the apex and base are white, both bordered with dark-brown bands. There has been some confusion about this shell. Lamarck refers to the figure of it for his or rather Bruguières' *Bulla fasciata*, but we do not see why Gmelin's name should be changed. Born figures it as *B. amplustre* of the Systema Naturæ, which is a different shell, and is described by Linnæus as having red bands. *Bulla velum* is said to be Oriental.

As an example of the more solid *Bullæ*, we take the well-known species *Bulla ampulla*. The shell is ovate and subglobose, beautifully mottled with white, plum-colour, and reddish. Instead of a spire there is an umbilical alveolus. Lamarck gives as a locality both the Indian and American oceans; Deshayes, the European ocean and the Indies. The fine specimens which we have seen were stated to have been Oriental.

[Bulla Ampulla.*]

* From an oversight of the draftsman in not using a mirror, the shell is made to appear reversed, or left-handed, as the collectors say.

Among the solid Bullæ we must mention the common *Bulla lignaria* of our coasts, with its testaceous stomach or gizzard, so well known as the vehicle of Gioèni's half error, half fraud. He found these testaceous gizzards and elevated them immediately to the rank of shells *sui generis* literally, for he gave the genus his own name and imposed upon many: he went so far as to describe the habits of his pretended testaceous animal. Draparnaud first exposed this piece of *charlatanerie*.

Bulla has been hitherto found at nearly the same depths and on nearly the same bottoms with *Bullæa*.

FOSSIL BULLÆÆ.

Lamarck enumerates four fossil species, all of them from Grignon: G. Sowerby says that such are only to be distinguished in the tertiary beds and in the green sand. Deshayes in his tables,* speaking of tertiary fossils only, gives two fossil species of *Bullæa*, one from the sub-Apennine beds, and one from Paris. Of *Bulla* he enumerates 23 fossil in the tertiary beds; and of these, two are both living and fossil, viz. *Bulla lignaria* and *B. ampulla*. The first he places in Sicily, in the sub Apennine beds (Italy), and the English crag at Bordeaux and Dax, in Touraine, at Turin, Angers, Paris, and Valognes: in short, in the beds of the Pliocene, Miocene, and Eocene periods of Lyell. The second Deshayes quotes as occurring in beds of the Pliocene period only, viz. those of Sicily and the sub-Apennine beds (Italy). In his edition of Lamarck (vol. viii. 1836,) he takes no notice of *B. ampulla* as a fossil, but notices *B. striata* (which he observes has been confounded with *B. ampulla*) as a fossil species. He also remarks on the confusion between *B. solida* and *B. cylindrica*, and proposes that *B. solida* should take the name of *B. cylindrica*; that the *Bulla cylindrica* of Bruguières, living in the Mediterranean and European seas, should be called *B. cylindracea* (Pennant's name); and that the fossil *Bulla* from the environs of Paris, confounded with the latter, should be named *Bulla Bruguièri*†.

De Blainville places the following Mollusks under his family of *Acères* (Acerata).

GASTEROPTERA,

whose body is divided into two parts, the posterior being globular and joined by a peduncle to the anterior portion, which is small, but enlarged on each side into a considerable muscular expansion transversely oval, and cut or hollowed out in the middle, both above and below, rendering the expansion bilobed, as it were, and an organ for swimming, in place of a foot for creeping. The lateral gill is uncovered: there is no shell. Example, *Gasteroptera Meckeli*, from the Sicilian seas.

[*Gasteroptera Meckeli*.]

The genera *Atlas* and *Bellerophon* are also arranged by De Blainville under his *Acères*. [ATLANTA and BELLE-ROPHON.]

BULLETIN, a French word which has been adopted by the English to signify a short authentic account of some passing event, intended for the information of the public. Bulletin is derived from 'bulla,' a sealed dispatch. (Ducange, *Glossarium*.) When kings and other persons of high rank are dangerously ill, daily bulletins are issued by the physicians, relative to the state of the patient. In times of war, and after a great battle, bulletins are sometimes issued from the head-quarters of the victorious army, and are sent off to the capital to inform the people of the success. This practice became common with the French grand army under the immediate command of the Emperor Napoleon from the time of the campaign of Austerlitz in 1805 till his abdication in 1814. He issued a series of bulletins during each campaign, which were intended to give information to the people at home of the progress of his operations and the triumphs of his arms. They were written in a popular and somewhat inflated style, and at last fell into such disrepute with the Parisians, that they

used to say of a man who lied largely, 'Il ment comme un bulletin.'

BULLEYN, ANN. [BOLRYN.]

BULLFINCH, or BULFINCH (in Latin *Pyrrhula*, in French *Bouvreuil*), the name of a genus of birds separated by Brisson from the Grosbeaks, afterwards again incorporated with them, and now by Temminck and others again arranged under Brisson's name *Pyrrhula*.

The following is Temminck's generic character:—

Bill short, hard, conico-convex, thick, swollen (bombé) on the sides, compressed at the point and towards the edge (arête) which advances upon the forehead; upper mandible always curved; lower mandible more or less so.

Nostrils basal, lateral, rounded, most frequently hidden by the plumage of the forehead.

Feet with the tarsus shorter than the middle toe; the front toes entirely divided.

Wings short, the three first quills graduated (étagées), the fourth longest.

Tail rather long, slightly rounded or squared.

The place generally assigned by ornithologists to the bullfinches, between the grosbeaks and the crossbills, appears to be their proper position. Their food consists principally of seeds and kernels; and though the smaller species confine themselves for the most part to grain or seeds which they open, rejecting the husk, some of the foreign species, as Temminck observes, have the bill excessively large and strong, and capable of fracturing the most ligneous seed cases. Cold and temperate climates, adds the author last quoted, appear to produce the greatest number of species. They are found in Europe and America. The North of Asia appears to be equally their cradle, but they have never yet been observed in New Holland, and but few have been noticed in Africa, while South America produces many. All the known species are subject to a double moult. The males and females differ, and can be easily distinguished in all stages of life. The young of the year differ but little from the old birds, and only till their autumnal moult.

EUROPEAN SPECIES.

We select as an example the common bullfinch, *Le Bouvreuil* and *Bouvreuil commun* of the French (Buff. and Temm.); *Pivone* of the same nation, according to Belon; *Fringuello marino*, *Cinfolotto*, *Suffuleno*, *Monachino*, of the Italians; *Dom-pape* of the Danes and Norwegians, *Dom-herre* of the Fauna Suecica, *Blutfinch*, *Roth-burster Gimpel*, and *Der Gimpel* of the Germans, *De Goudvink* of the Netherlands, *Y Chyrbanydd*, and *Rhawn goch* of the ancient British, *Loxia Pyrrhula* of Linnæus, and *Pyrrhula vulgaris* of Brisson.

The native song of this common but pretty bird is very soft and simple, but so low that it is almost inaudible. Its call is a plaintive whistle, and when feeding it utters a low short twitter. It has however acquired great celebrity from the facility with which it learns to whistle musical airs, and from the retention of its memory when well educated and carefully attended to. 'Those which are to be taught,' says Bechstein, 'must be taken from the nest when the feathers of the tail begin to grow, and must be fed only on rape-seed soaked in water and mixed with white bread; eggs would kill them or make them blind. Their plumage is then of a dark ash-colour, with the wings and tail blackish brown. The males may be known at first by their reddish breast, so that when these only are wished to be reared they may be chosen in the nest, for the females are not so beautiful nor so easily taught, though they answer the purpose of call-birds as well as the male.' Mrs. Charlotte Smith however says (*Nat. Hist. of Birds*) she had a nest of bullfinches given her of which only one was reared: it was a hen, which she kept only because she had reared it, but the bird hung in the same room with a very fine Virginian nightingale, whose song she soon acquired, and went through the same notes in a lower and softer tone. 'Although the young,' continues Bechstein, 'do not warble before they can feed themselves, one need not wait for this to begin their instruction, for it will succeed better, if one may say so, when infused with their food; since experience proves that they learn those airs more quickly and remember them better which they have been taught just after eating. It has been observed several times that these birds, like the parrots, are never more attentive than during digestion. Nine months of regular and continued instruction are ne-

* Lyell's 'Principles of Geology,' 8vo. edit., vol. iii. appendix 1.

† The specific names 'cylindrica' and 'cylindracea' are so nearly alike, that we fear there will still be confusion.

cessary before the bird acquires what amateurs call firmness; for if one ceases before this time, they murder the air by suppressing or displacing the different parts, and they often forget it entirely at their first moulting. In general it is a good thing to separate them from the other birds, even after they are perfect, because, owing to their great quickness in learning, they would spoil the air entirely by introducing wrong passages; they must be helped to continue the song when they stop, and the lesson must always be repeated whilst they are moulting, otherwise they will become mere chattering, which would be doubly vexatious after having had much trouble in teaching them.' The translator adds to this that he does not recommend the employment of bird-organs for instruction, because they are rarely accurate, and their notes are harsh and discordant; for bullfinches repeat the sounds exactly as they hear them, whether harsh or false, according to the instrument used. 'The good and pure whistling of a man of taste,' he further observes, 'is far preferable; the bird repeats it in a soft, flute-like tone.' When one cannot whistle well, he recommends the use of a flageolet.

In corroboration of this, the Hon. Daines Barrington, in his interesting letter to Dr. Maty, then (1773) secretary of the Royal Society, detailing experiments and observations on the singing of birds, states that, though many of them are capable of whistling tunes with our more gross intervals, as is well known by the common instances of piping bullfinches and canary-birds, this arises from mere imitation of what they hear when taken early from the nest; for if the instrument from which they learn is out of tune, they as readily pipe the false as the true notes of the composition. And he adds, that as birds adhere so steadfastly to the same precise notes in the same passages, though they never trouble themselves about what is called *time* or harmony in music, it follows that a composition may be formed for two piping bullfinches, in two parts, so as to constitute true harmony, though either of the birds may happen to begin or stop when they please. He procured such a composition by Mr. Zeidler, which he sent with his letter, remarking that it need scarcely be observed that there cannot possibly be much variety in the part of the second bullfinch. Slaney, on the information of a friend, states that the bullfinches imported from Germany have been chiefly taught to sing by weavers whilst at work at their looms, which is said to account for the birds beginning to sing when the head of a person standing before him is moved backwards and forwards. A single air with a short prelude is generally as much as the bird can learn and remember; but Bechstein, who asserts this, allows that there are some of them which can whistle distinctly three different airs, without spoiling or confusing them in the least. In truth, as the same author observes, there are different degrees of capacity among the bullfinches as well as in other animals. One young bullfinch learns with ease and quickness, another with difficulty and slowly; the former will repeat without hesitation several parts of a song; the latter will hardly be able to whistle one after nine months' uninterrupted teaching. Those birds which learn with most difficulty are said to remember the songs, when once learnt, better and longer, and rarely forget them even when moulting. To these attractive qualities of the bullfinch must be added its obedience and capability of strong attachment, which it shows by a variety of little endearing actions; and it has been known even to repeat words with an accent and tone indicative of sensibility, if, as Bechstein observes, one could believe that it understood them. Of its attachment the following are instances:—Buffon asserts that tame bullfinches have been known to escape from the aviary, and live at liberty in the woods for a whole year, and then to recollect the beloved voice of the person who had reared them, returning never more to leave her. Others, when forced to leave their master, are said to have died of grief. They well remember an injury. One of them having been thrown down, cage and all, by some low people, did not seem at first much disturbed by the fall, but afterwards, when it saw a shabbily-dressed person, it fell into convulsions, and died in one of those fits eight months after the first accident. A bullfinch belonging to a lady was subject to frightful dreams, under the pressure of which it would fall from its perch and beat itself in the cage; but no sooner did it hear the affectionate voice of its mistress than, notwithstanding the darkness, it became at once tranquil, and mounted its perch to sleep again. Buffon's story of the return of the escaped

bullfinch is corroborated by the amiable qualities ascribed to it by Bechstein, for he says that, among other feats, it may be accustomed to go and return, provided the house is not too near a wood, and that the surest means of preventing too long an absence is to put a female bullfinch in a cage in the window, or to leave her in the room with her wing clipped; when the affection of the male will soon bring him back to her, nor will he ever abandon her altogether. Our limits will not permit us to dwell longer on the manners of this interesting little bird in captivity, and we must refer the reader for such information and the mode of treatment to Bechstein's 'Cage Birds' above referred to. Several hundreds of taught birds, we may observe, are annually sent to Berlin, London, and other capitals, by the German bird-sellers, and form a small article of commerce, at a price varying from one to several pounds sterling a piece, according to the merits of the bird. The time of the arrival of these merchants in London is April or May.

Food.—In a state of nature the bullfinch feeds on pine and fir seeds, corn, linseed, millet, rape and nettle seed, all sorts of berries, and the buds of most trees, among which those of the oak, beech, plum, cherry, and gooseberry are favourites. Bewick says that in the spring it frequents gardens, where it is usefully busy in destroying the worms which are lodged in the buds. Busy it is; but we are compelled to add that its utility, to the horticulturist at least, is no longer questionable. In its devastation it may now and then, and no doubt does find a worm in a bud; but its object is the bud, not the worm. 'They feed most willingly upon those buds of trees which break forth before, indeed are pregnant with, the leaves and flowers, especially those of the apple-tree, pear-tree, peach-tree, and other garden trees; and by that means bring no small detriment to the gardeners, who therefore hate and destroy them as a great pest of their gardens, intercepting their hopes of fruit.' Such is Willughby's verdict. 'I have known,' says Selby, 'a pair of these birds to strip a considerable-sized plum-tree of every bud in the space of two days. These buds are not swallowed whole, but first minutely divided by the point of the powerful bill.' 'Its delight,' observes Mr. Knapp in his interesting and lively 'Journal of a Naturalist,' 'is in the embryo blossoms wrapped up at this season (spring) in the bud of a tree; and it is very dainty and curious in its choice of this food, seldom feeding upon two kinds at the same time. It generally commences with the germs of our larger and most early gooseberry; and the bright red breasts of four or five cock buds, quietly feeding on the leafless bush, are a very pretty sight; but the consequences are ruinous to the crop. When the cherry buds begin to come forward, they quit the gooseberry, and make tremendous havoc with these. I have an early wall cherry, a may-duke by reputation, that has for years been a great favourite with the bullfinch family, and its celebrity seems to be communicated to each successive generation. It buds profusely, but is annually so stripped of its promise by these feathered rogues, that its kind might almost be doubted. The Orleans and green-gage plums next form a treat, and draw their attention from what remains of the cherry. Having banqueted here a while, they leave our gardens entirely, resorting to the fields and hedges, where the sloe-bush in April furnishes them with food.'

Nest.—Bewick places it in bushes, and says that it is composed chiefly of moss,—Bechstein in the most retired part of a wood, or in a solitary quickset hedge, adding that it is constructed, with little skill, of twigs which are covered with moss. Graves says that it is mostly found in the thickest part of a black or white thorn bush, and that it is composed of small twigs and moss, and is lined with soft dry fibres. Temminck states that it builds in the elevated and least accessible forks of trees (*dans les enfourchemens élevés et les moins accessibles des arbres*). Mr. Rennie observes, that he is at a loss to conceive on what authority Montbeillard describes the nest as consisting of moss, lined with soft materials, with an opening said to be the least exposed to the prevailing wind; and no less why M. Temminck says 'it builds in the most elevated and least accessible forks of trees;' and he quotes Latham as declaring that the bird rarely uses moss, observing that he has seen a considerable number of the nests, and never found any of the circumstances stated by Montbeillard and Temminck hold good; and that he 'sometimes found them in low thick bushes, but most commonly on the flat branch of a spruce pine or silver fir,' usually about four feet from the

ground, and sometimes lower. He is inclined to say that the bird never uses moss. Selby agrees with Rennie, generally speaking, and describes the nest as shallow and formed of small sticks, lined with a few root-fibres in a low tree, or in the thickest underwood; and so does Jenyns, who places it generally in thick bushes, and says that it is composed of dry twigs and lined with fibrous roots. These discrepancies may perhaps be accounted for by difference of locality and circumstances, for we know how birds will modify their selection of materials in conformity thereto. The eggs are generally four or five; Temminck says from three to six, but in this country the number is usually four, of a bluish-white, speckled and streaked with purplish or pale orange-brown at the large end, and rather obtuse. The young are generally hatched in May or the beginning of June, and there are frequently two broods in a year. Time of incubation fifteen days.

Geographical distribution.—The species is widely spread. They are common in most parts of northern Europe, extending into Russia and Siberia: in the south of Europe they occur only as birds of passage. They are said to winter in Italy. Gesner says that about the Alps the bird is called *Franguel Invernengk*—that is 'winter finch.' Bonaparte notes it as '*raro, d'inverno, Avventizio*' near Rome. Thunberg long ago said that the common bullfinch was found in Japan, and this is corroborated by Dr. de Siebold, for it is one of the European species which he found in that country. The bird is particularly common in the mountainous forests of Germany; and it is from Cologne and other spots.

'Where Rhemus strays his vines among.'

that the market for piping-bullfinches is principally supplied. Bechstein mentions that there are schools for these little musicians in Hesse and Fulda, and at Waltershausen near Gotha. With us the bullfinch is a constant resident.

Description.—Male: length about six inches and three-quarters, two inches and three-quarters being taken up by the tail, which is rather forked, and of a lustrous black, shot as it were with iron blue. Bill six lines in length, short, thick, and black. Shanks eight lines high, and black. Irides of a chestnut colour. Crown of the head, circle round the bill, and upper part of the throat of the same hue with the tail. Nape, back, and shoulders deep grey, or rather bluish-grey. Cheeks, neck, breast, belly (to the centre of it), and flanks red. Rump and vent white. Greater wing-coverts tipped and margined with a French or pinkish-white, forming a transverse bar across the wing.

[*Pyrrhula vulgaris*. Male.*]

Female.—Somewhat less than the male, and of a reddish-grey where he is red: back brownish-grey: feet brownish-black. The colours generally less bright than in the male.

* Its provincial names are Monk, Pope, Coalhood, Coallyhood, Hoop, Tony hoop, Alp, Nope. For Belon's opinion (in his 10th edition) that the bullfinch is the *συνελίς* and *μυδαρχήριος* of the Greeks, and my observations thereon, see BLACKBAY. The 'quatrain' in the small No. 1, 1557, makes the bullfinch by eighteen eggs.

Young of the year.—At first ash-colour, with wings and tail of blackish-brown; afterwards more like the female till the autumnal moult; but the young males may always be known by the greater tinge of red about the breast.

Varieties.—1. *Black.*—This variety may be produced artificially by feeding the bird entirely on hempseed, in which case a change of diet will often produce the true colours. Bechstein says it will arise from being kept when young in a totally dark place; and that females, either from age or from the diet above-mentioned, are most subject to it.

2. *White.*—This is merely an albino of an ashy or dusky white, or cream-colour. The parts which are generally black are more shaded than the rest. There is a specimen from Middlesex in the British Museum.

3. *Speckled or variegated.*—Spotted with black and white, or white and ash-colour, besides the natural hues. Selby says that Captain Mitford killed one, of which both the wings were white.

4. Bechstein mentions varieties under the name of the *Large Bullfinch*, about the size of a thrush, and the *midling* or *common*. He treats the *dwarf* variety, which is said to be not so large as a chaffinch, as a bird-catcher's story; for he observes that this difference of size occurs in all kinds of birds, and says he has had opportunities every year of seeing hundreds both wild and tame, and adds, that he has even found in the same nest some as small as red-breasts, and others as large as a crossbill.

HYBRIDS.

1. The offspring of a female reared in the house from the nest, and of a male canary. In shape and colour the hybrid partakes of the hues of the parents. Bechstein states that its note is very agreeable, and softer than that of the canary, and that the bird is very sensible, as the union rarely succeeds. When tried, a very ardent and spirited canary should be chosen.

2. The offspring of a bullfinch and female canary. The translator of Bechstein's interesting little book says, that the sexes above-mentioned once produced five young ones, that died on a journey which they could not bear. Their large beak, and the blackish down with which they were covered, showed that they were more like their father than mother.

ASIATIC SPECIES.

Of these we select *Pyrrhula Synoica* as an example. The

Pyrrhula Synoica. Upper figure male, lower figure female.

adult male is ornamented round the base of the bill with a circle of rich red, going off in spots upon the cheeks. The front is covered with small lustrous white feathers, of a silvery white, lightly shaded upon the borders with red; all the lower parts of the body, the inferior coverts of the tail and the rump are of a brilliant rose-colour, or clear carmine; the upper parts are ash-coloured, lightly tinged with rose; wings and tail brown, with ash-coloured borders.

The female is brown, of a light brown or earth-colour above, with longitudinal lines of deeper brown upon each feather. The lower parts are of a very clear brown or Isabella-colour, with longitudinal stræ of a somewhat deeper brown upon the middle of the feathers. The tail is slightly notched at the end, and the bill and feet in both sexes are of a clear brown. Length about 5 inches and 5 8ths. M. Hemprich found this species near Mount Sinai, in Arabia; and there are specimens in the museums of the Pays-bas and of Berlin. Temminck, from whose work the figures and description are taken, thinks it possible that 'the social bullfinch' may be found some day in the islands of the Grecian Archipelago, and that it may easily pass in its migrations the arm of the sea between Asia and those isles.

Temminck received his specimen from Professor Lichtenstein; and it was one of the discoveries of the travellers sent not long ago by the King of Prussia into Egypt with a view of obtaining objects of natural history.

A species from the Himalaya mountains, *Pyrrhula Erythrocephala*, figured in Mr. Gould's beautiful work, comes near to the common bullfinch of Europe except in the form of the tail, which is decidedly forked, while in the European it is nearly even. There is a specimen of *Pyrrhula Erythrocephala* in the British Museum, and another in that of the Zoological Society.

AFRICAN SPECIES.

We select *Pyrrhula Gigathinca*. This species is characterized by a very thick bill, and a slightly notched tail. The colours of the sexes do not vary greatly. In the male a greyish colour tinted with bright rose covers all the lower parts of the body, the throat, and the circle round the bill; this tint is palest on the throat. The crown of the head is pure ash-colour, and an ashy brown is spread over the nape,

the back, and the wing-coverts. A faint rose-colour tinges the plumage of the rump and the edges of the quills and tail-feathers, all of which are bordered towards the end with whitish upon a black ground. The two middle quills are the shortest. The wings reach to the extremity of the tail-feathers; and the bill is of a fine red. Length four inches six lines.

The female has no rosy tint except on the edges of the quills and tail-feathers, and on the rump, where it is very faint. The upper parts are of an Isabella-brown, and the wings edged with a brighter tint of the same. The circle round the bill and the throat are ash-coloured; the lower parts of a pure Isabella-colour; and the middle of the belly white. Bill same as in the male.

This bird is figured in the great French work on Egypt (plate 5, fig. 8), and was lately sent home by the German travellers to the north of Africa. It inhabits Egypt and Nubia. There are specimens in the Berlin museum, and in those of the Pays-bas and of Frankfort.

AMERICAN SPECIES.

We take *Pyrrhula Cinereola* as an example. Head, cheeks, back, and scapulars ashy-bluish, wings and tail darker, but all the feathers of those parts are bordered with ash colour. There is a small white spot on the wing, formed by the white towards the base of the quills, beginning with the fourth; the three first have no white. All the lower parts are white, with the exception of the flanks, which are clouded with ash-colour. Bill coral-red, very strong, large, and as it were swollen (bombé). Feet ash-coloured. Length 4½ inches. Inhabits Brazil, where it is said to be common.

[*Pyrrhula Gigathinca*; lower figure, male.]

[*Pyrrhula Cinereola*.]

BULLIARD, PIERRE, a botanist, was born at Aubepierre-en-Barrois, about the year 1742, and studied at the college of Langres, where he early displayed a taste for natural history. After his preliminary education was finished, a situation was obtained for him in the abbey of Clairvaux, where he found time to prosecute his favourite studies; and though he afterwards removed to Paris, with a view to apply to medicine as a profession, his zeal for natural history induced him to devote himself entirely to this subject. Being previously an able draughtsman, he now learnt to engrave, and in 1774 published the '*Flora Parisiensis*,' 6 vols. 8vo., the figures being drawn, engraved, and coloured by himself. In 1778 he published '*Avicéptologie Française, ou Traité*

général des toutes les ruses dont on peut se servir pour prendre les Oiseaux,' Paris, 1 vol. 12mo., reprinted in 1796. In 1779 he commenced his largest work, entitled 'Herbier de la France,' the first division of which, comprising 'L'Histoire des Plantes vénéneuses et suspectes de la France,' while in the course of publication in the form of numbers, was seized by the police, under the pretext that it was a dangerous work. More than 500 copies were seized; and it was not till after the lapse of seven months that the author was able to recover his property. Even then only thirty-seven copies were restored to him. This volume is therefore extremely rare, and its very existence is to many unknown, owing to the second division, or 'L'Histoire des Champignons,' bearing on the title-page the words 'Tome premier,' though it did not appear till 1790. The remaining six volumes contain only plates, principally of fungi, of which one livraison appeared annually, each containing 48 coloured plates, making in all 576; but at the end of the eighth volume are 24 plates, to which however there is no reference in the index of that volume.

This work was discontinued, owing to the death of the author in 1793. The letter-press in the first two volumes is not now of much value; but the plates of flowering plants are in general good, and have, in many instances, received the commendation of De Candolle: those of the fungi are frequently cited not only by the botanists of France, but by all writers on European fungi. It is to be regretted, however, that several inaccuracies in numbering the plates have in many instances led to confusion and error: a corrected index to the whole work would, by counteracting the effects of such inaccuracies, be of great utility. A second part of the work appeared at Paris in 1832, entitled 'Figures des Champignons, servant de Supplément aux Planches de Bulliard, peintes d'après Nature, et lithographiées par J. B. Letellier,' in small folio, six cahiers, containing the plates from 603 to 638.

Bulliard published also, in 1783, 'Dictionnaire Elementaire de Botanique,' Paris, in folio, with two plates. It was reprinted in the same form in 1797, and again, having been revised and remodelled by L. C. Richard, in 1779, in 8vo.; and subsequently, with many additions by the same eminent botanist, in 1802.

Bulliard was the inventor of the art of printing plates of natural history in colours, and he employed it in all his works.

BULLION, a term which is strictly applicable only to uncoined gold and silver, but which has been frequently used in discussions relating to subjects of public economy to denote those metals both in a coined and an uncoined state.

Among the earliest notices of the estimation in which the precious metals were held we find (Genesis, chap. xii.) that Abraham was 'rich in cattle, and in silver, and in gold.' For the field which he bought as a burial-place for Sarah he gave 400 shekels of silver, not in coined money, but 'by weight, according to the currency of the merchants.' (Gen. ch. xliii.) Joseph, the descendant of Abraham in the third generation, was sold by his brethren for thirty pieces of silver; which makes it probable that silver bullion was then divided into pieces of known weight and fineness, answering the purposes of coin, if indeed this money was still uncoined. Frequent mention is made in the book of Kings of the gold of Ophir, a large amount of which was procured by Solomon for ornamenting the interior of the temple. The statements of Herodotus and other Greek and Roman writers concerning the amount of the precious metals possessed by some individuals are mixed up with so much that is improbable, that it is hardly possible to draw from them any certain conclusions. The supply of gold and silver in those days appears to have come from various quarters. Asia, Egypt, Nubia, Ethiopia, Thrace, and Spain, are said to have yielded the greater part. Little more than conjecture can be offered as to the amount of bullion which in those remote times was annually added to the stock in Europe.

The discovery of the mines in America did not at first add materially to the stock of bullion in Europe. Humboldt has estimated the amount which America furnished to Europe in the years 1492 to 1521 at 52,000*l.* per annum. During the 25 years that succeeded the conquest of Mexico in 1521, the annual supply, as estimated by the same authority, was 630,000*l.*, making a total addition of about 17,500,000*l.* sterling in the course of 54 years. At the end

of this period, 1546, the silver mines of Potosi were discovered, and added very considerably to the produce of the American mines. In 1539 some gold mines had been opened in Chili; and the average annual supply of gold and silver to Europe from all these sources during the 54 years from 1546 to the end of the 16th century has been estimated at rather more than 2,000,000*l.* sterling. In the meantime the fashion of applying the precious metals to the making of articles of domestic utility as well as of ornament increased considerably. Another important vent for bullion was during this time found in the trade that grew out of the discovery of the route to India by the Cape of Good Hope, in the prosecution of which it was long necessary to pay for eastern products in gold and silver, because Europe had then little else to offer at prices which admitted of exportation to India. The improvements which since that time have been brought about in our manufacturing processes have so changed the nature of this trade, that the exports from England to India have at times much exceeded the value of the goods imported in return, and the balance has come forward in bullion.

During the 17th century Humboldt estimates the average annual supply of the American mines at 16,000,000 of dollars, about 3,333,333*l.*; in the next half century at 22,500,000 dollars, or 4,687,500*l.*; and in the 53 years following, viz., from 1750 to 1803, at 35,360,000 dollars—7,354,166*l.* The produce of single years at the beginning of the present century is stated to have been greater than the average here mentioned, and to have somewhat exceeded 9,000,000*l.* of sterling money.

The revolution in the Spanish American dominions in 1810 very materially affected the productiveness of the mines. The proprietors of many of them were forced to fly from the country, and the works of all the greatest mining establishments were either destroyed or suffered to fall to ruin. The effect of this political convulsion upon the production of the precious metals was immediate and important, but has perhaps been somewhat exaggerated. It appears from the returns sent to the English government by our consular agents, that the total value of bullion produced in the mining districts of Mexico and South America during 20 years, from 1810 to 1829, amounted to 60,165,891*l.*, being equal to an annual average supply of 3,008,294*l.* sterling money; the annual average value in the 20 preceding years, from 1790 to 1809, was 6,106,705*l.* The produce in part of the latter period has, owing to the application of English capital, been greater than it was in the first years following the revolution; and there is reason to expect that hereafter the mines in those quarters may yield a produce equal to anything they have formerly yielded. By returns received from the British consuls in Mexico and Peru, it appears that the gold and silver raised in those two states in the year 1834 amounted in value to 3,060,276*l.* No statement has yet been given of the produce in that year of the mines in Chili, in the republic of Rio de la Plata, Brazil, Columbia, and the republic of central America, the aggregate of which may be fairly estimated at 1,000,000*l.* sterling.

An official statement recently transmitted from Mexico mentions that the Fresnilla mines in Zacatecas, which were formerly worked on account of the government, have been leased to a company of private adventurers, natives of Mexico, who are already obtaining from the mines a weekly produce of from 70 to 100 bars of silver, each bar of 1000 dollars value. At the mean of these two rates, the yearly produce of the Fresnilla mines alone will amount to nearly one million sterling.

It is estimated by Mr. Jacob that the gold and silver annually yielded by the mines of Hungary and Transylvania amount to about 3,000,000 of florins (312,500*l.*).

The official statement published by the minister of finance in St. Petersburg gives the annual average produce of the gold mines in the Ural mountains, during the last 11 years, at a sum equal in English money to 606,724*l.* The silver yielded by the Altai and Da-urian mines is more loosely given, on the same authority, at 1000 poods per annum, equal in value to 130,000*l.* It is further stated, that during 1835 a considerable quantity of gold was procured by washings on the Altai mountains, but no estimate of the amount has been given. The government of Russia has of late years endeavoured to place platinum among the precious metals, by putting into circulation coins made of that metal; but the experiment does not appear to have answered. A

want of confidence in the stability of its price makes it impossible to circulate any large amount of platinum coin. The minting of the platinum is confined to the produce of the government platinum mines.

A new source of supply, as regards gold, has lately been found in the U.S. of America. The first notice of gold of native produce, on the records of the mint of the U.S., occurred in 1814, when the value of 11,000 dollars (about 2300*l.*) was received in that establishment. The average received during the ten following years was very small, viz., 2500 dollars, or little more than 500*l.* In 1825 the amount received was 17,000 dollars (3500*l.*); and since that time the increase has been considerable. The gold region, which at first was thought to be confined to N. Carolina, has been found to commence in Virginia, and to extend to N. and S. Carolina, Georgia, Tennessee, and Alabama. The productiveness of this region since 1824 will be partially seen from the following table:—

	Virginia	N. Caro- lina	S. Caro- lina	Georgia	Tennes- see	Alaba- ma	Total
	Dollars	Dollars	Dollars	Dollars	Dollars	Dollars	Dollars
1824	..	5,000	5,000
1825	..	17,000	17,000
1826	..	30,000	30,000
1827	..	21,000	21,000
1828	..	46,000	46,000
1829	2,500	134,000	3,500	140,000
1830	24,000	201,000	26,000	212,000	463,000
1831	26,000	294,000	22,000	125,000	1,000	1,000	520,000
1832	31,000	458,000	45,000	140,000	1,000	..	675,000
1833	104,000	475,000	66,000	216,000	7,000	..	868,000
1834	62,000	380,000	39,000	415,000	3,000	..	899,000
Total	254,500	2,054,000	200,500	1,159,000	12,000	1,000	3,679,000

The gold in these states is sometimes found in the form of small particles of metal mixed with sand, and it is then obtained by the simple process of washing; in other places it occurs below the surface in the form of ore, which must be reduced by smelting. The gold of native production is said to be much greater in value than is indicated by the foregoing table, a part of the produce being exported in its uncoined state, without visiting the U. S. mint. This proportion has been variously estimated. One calculation carries the total produce of the entire district to five millions of dollars, or more than a million sterling; but this is probably an exaggeration. An able mineralogist, who lately visited America for the purpose of examining these mines, has given it as his opinion that, from the scantiness of the supply, as compared with the great extent of country over which it is spread, gold-mining cannot be profitably carried on upon a large scale, but must be in a great measure left to the industry of individual adventurers, acting upon a limited scale.

It is scarcely possible to make any near approach to accuracy, in estimating the consumption of the precious metals. Mr. Jacob, who has gone into some curious calculations upon the subject, estimates the annual consumption in Europe of gold and silver, for other purposes than that of coined money at very little less than six millions sterling. But some part of this amount is furnished by the re-melting of articles, the fashion of which has become obsolete, and by the burning of old gold and silver lace and other worn-out ornaments. Mr. Jacob estimates the part thus obtained at one-fortieth of the whole.

Attempts have been made to ascertain the loss in the wear of coins which have been in circulation for various periods. For this purpose an experiment was made in July, 1833, when Lord Auckland was Master of the Mint, upon 1200 sovereigns and 1200 half-sovereigns, 300 of each denomination having been put in circulation in 1817, 1821, 1825, and 1829, respectively, and upon similar numbers of silver half-crowns, shillings, and sixpences, which had been in circulation during the same number of years. The result of this experiment is given as follows:—

Gold.

300 Sovereigns of 1817, which had, been 16 years in circulation had lost at the rate of 8*s.* 10*d.* per 100*l.* value.

300	..	1821	..	12 yrs.	..	9 <i>s.</i> 1 <i>d.</i>
300	..	1825	..	8	..	6 8
300	..	1829	..	4	..	3 5½
300	Half-sovs.	1817	..	16	..	16 4
300	..	1821	..	12	..	13 10
300	..	1825	..	8	..	13 6½
300	..	1829	..	4	..	6 2

Silver.

per 100*l.* value.

300	Half-crs.	1817	16	£2 7
300	..	1821	12	1 13 0
300	..	1825	8	0 16 11
300	..	1829	4	0 1 9
300	Shillings,	1817	16	4 19 0
300	..	1821	12	2 18 5
300	..	1825	8	2 1 6
300	..	1829	4	0 8 11
300	Sixpences,	1817	16	5 11 11
300	..	1821	12	4 1 5
300	..	1825	8	3 3 4
300	..	1829	4	1 8 7

The amount of gold and silver money coined at the English Mint, since 1790, has been as follows:—

	Gold.	Silver.
5 years, 1790—1794	£11,595,276	£251
5 .. 1795—1799	6,375,859	293
5 .. 1800—1804	2,392,039	265
5 .. 1805—1809	1,130,464	405
4 .. 1810—1813	1,148,921	263
3 .. 1814—1816	nil.	1,805,413
5 .. 1817—1821	17,611,560	5,561,252
5 .. 1822—1826	20,658,991	1,624,914
4 .. 1827—1830	8,355,831	157,719
4 .. 1831—1834	5,610,926	466,762

The small amount of silver stated above as having been coined previous to 1816 was what is called *Maundy money*, from the circumstance of its being distributed in alms by the king on Maundy Thursday.

A considerable part of the gold coined in the five years from 1817 to 1821 was exported to Paris, where it was melted and converted into Louis-d'or. The large amount coined in the next quinquennial period was required to supply the place of the 1*l.* and 2*l.* notes withdrawn from circulation in 1821, and by the commercial panic of 1825. [BANK—BANKING.]

BULL-RUSH, the English name of *typha latifolia* and *angustifolia*, two wild marsh plants bearing long black cylindrical masses of flowers. The name is also sometimes applied to *scirpus lacustris*, a tall rushy-looking plant from which the bottoms of chairs, mats, &c. are often manufactured.

BULLS, PAPAL. Letters issued from the papal chancery, and so named from the *bullo* or leaden seal which is appended to them. The difference between bulls, briefs, and other Apostolical rescripts, is noticed under the word **BRIEF**. Bulls are written on parchment. If they regard matters of justice, the seal is affixed by a hempen cord; if of grace, by a silken thread. The seal bears, on the obverse, heads of St. Peter and St. Paul; on the reverse, the name of the pope, and the date of the year of his pontificate. In France, in Spain, and in most other kingdoms professing the Roman Catholic faith, bulls are not admitted without previous examination. In England, to procure, to publish, or to use them, is declared high treason by 13 Eliz. c. 2. The name Bull has also been applied to certain constitutions issued by the emperors. In affairs of the greatest importance bullæ of gold were employed, whence they were called Golden Bulls.

Eleven folio volumes, published at Luxemburg, between 1747 and 1758, contain the bulls issued from the pontificate of Leo the Great to that of Benedict XIV., from A.D. 461 to A.D. 1757. The two most celebrated among them are, that *In cœnâ Domini*, which is read every year, as these words imply, on the day of the Lord's Supper (Maundy Thursday): it denounces various excommunications against heretics and other opponents of the Romish see: 2. the bull *Unigenitus*, as it is called from its opening words, '*Unigenitus Dei filius*,' issued by Clement XI. in 1713, condemning 101 propositions in Quesnel's work, or, in other words, supporting the Jesuits against the Jansenists in their opinions concerning divine grace.

The most remarkable *Imperial Bull* is that approved by the Diet of the Germanic empire in 1356, in which Charles IV. enumerated all the functions, privileges, and prerogatives of the electors, and all the formalities observed in the election of an emperor, which were considered as fundamental laws till the dissolution of the Germanic body in 1806. We believe that the Latin original is still preserved at Frankfort with the golden seal, or *bullo*, from which it derives its name, appendant to it.

BULWER, JOHN, an English physician of the seventeenth century, who devoted himself to the discovery of methods for communicating knowledge to the deaf and dumb. Dr. Wallis is generally regarded as the originator, in England, of an art by which the benefits of instruction are bestowed on the deaf, and in the 'Memorials' of his own life he appears in unrivalled possession of this honour. But Bulwer, a contemporary of Wallis, has claims which only need to be known to entitle him to the credit which has so generally been given to another. That Wallis was disingenuous on this subject, in more than one instance, is evident from a notice of Dalgarno's works, which appeared in the 'Edinburgh Review,' No. cxxiv. Whether Bulwer and Wallis had received intelligence of what had been accomplished by Ponce and Bonet in Spain cannot now be determined. It is probable that Bulwer had obtained no such information, for his mode of treating the subject is very original, and rather that of an inventor than a copyist. The earlier practice of Wallis is in many respects similar to the methods pursued by Bonet, as detailed in his work, published in 1620. [BONET.] It is probable that Bulwer did not use a manual alphabet, for he mentions, with a degree of admiration, the employment of this medium of communication, in the case of a gentleman who became deaf through disease. Wallis used no finger-alphabet in his first attempts, but he seems to have been aware of its utility, for in after-years he appropriated, without acknowledgment, the one which Dalgarno invented. Sir Kenelm Digby, who was deeply impressed with Bonet's success in Spain, would probably send the first intelligence of his labours to England. Sir K. Digby had much correspondence with Dr. Wallis on philosophical subjects previous to 1658, in which year Wallis published the results of that correspondence. As Wallis had published a treatise on speech in 1653, it is highly probable that the results, then new and curious, which Digby had witnessed in Spain in the instruction of the deaf and dumb, would be communicated by him to his philosophical friend. Wallis did not make public the inventions which he claimed for instructing the deaf till 1670, several years after Digby's death, though he introduced his first pupil, Mr. Whalley, before the Royal Society in 1662, after a year's instruction.

It has been considered necessary thus to trace what Dr. Wallis accomplished, in order to place Bulwer in his proper light, and to show the value of his performances; in estimating which, it must not be forgotten that no English writer, as far as can be now ascertained, had previously employed himself on the subject which Bulwer attempted to elucidate. A few years before 1648 Bulwer published 'Chironomia, or the Art of Manual Rhetoric,' and 'Chirologia, or the Natural Language of the Hand.' These are the works which obtained for him the surname of 'the Chirologist.' They formed part of that system of artificial language which he designed to employ in developing his philosophical views, and by which he proposed to lead the deaf to a knowledge of spoken language. Bulwer's chief work is entitled 'Philosophus, or the Deaf and Dumb Man's Friend, exhibiting the philosophical verity of that subtle art which may enable one with an observant eye to hear what any man speaks by the moving of his lips. Upon the same ground, with the advantage of an historical exemplification, apparently proving, that a man borne deaf and dumb may be taught to hear sounds of words with his eye, and thence learn to speak with his tongue. By J. B., surnamed the Chirologist. London, 1648.'

Bulwer's principles of instruction may be gathered from the above works: they appear to have been imitative signs, or the language of action; the labial alphabet, or reading the movements of the lips; and articulation. There was an originality in his conceptions which no prior or contemporary author on the subject, in this or any other country, could claim. He noticed the power which the deaf possess of hearing sounds through the teeth, an experiment which may be made in various ways, especially by means of a musical box or a repeating watch. He also produced several other works, among which were the following:—'Tractatus de removendis loquelæ impedimentis'; 'Tractatus de removendis auditoris impedimentis.' It is probable that these treatises were not published; their titles occur at the end of one of his curious works, which appeared in 4to. in 1653, called 'Anthropo-metamorphosis, man transformed, or the artificial changeling, in which he shows the great variety of shapes and dresses which men have assumed in the different

ages and nations of the world. He also published 'Pathomyotomia, or a dissection of the significative muscles of the affections of the mind,' 1649, 12mo.

Bulwer must be regarded as a man of persevering research, and though not an instructor of the deaf and dumb, he was undoubtedly the first in England to point out a safe and certain path which teachers might pursue.

BUNDELCUND or **BOONDELA**, a division of the prov. of Allahabad, in Hindustan, lies between 24° and 26° N. lat., and 77° and 82° E. long. This territory is bounded on the N. by the river Jumna; on the E. by Baghuleund; on the S. by Malwa and Berar; and on the W. by the possessions of Scindiah. In its form, Bundelcund is an irregular parallelogram; its greatest length is in the direction from S.E. to N.W.; its area comprises nearly 24,000 sq. miles; and the population consists of 2,400,000 souls.

There are three ranges of mountains in Bundelcund, which extend in continuous ranges parallel to each other. One of these ranges, which forms part of the Vindhyan chain, is less sterile and rugged than the part of the same chain which passes through Bahar. On the summit of this range a considerable extent of table-land occurs, which is 1200 ft. above the level of the Gangetic plain. The second mountain range, called the Panna ghats, runs parallel to the Vindhyan chain at the distance of about 10 m. The third range, called the Bandair, occurs at about an equal distance beyond the second to the N.W., and comprises the most elevated part of the province.

The soil of Bundelcund presents a very great variety. The valleys and low lands consist principally of rich black loam: the lofty country and elevated table-land are in great part composed of poor and sterile soil. The fertile tracts, when assisted by irrigation, produce abundant harvests of every kind of grain and plant that is cultivated in Hindustan: the principal produce of the poorer lands is millet. There are no forests in this division of the province. Iron is found among the hills, where also catechu or terra Japonica is produced in abundance.

The principal rivers of Bundelcund are the Betwah, the Desan, and the Ken or Cane. The Betwah rises in Gundwana, 3 m. S.W. of the Shahpoor ghaut, and flowing N. enters Bundelcund at 25° 3' N. lat. and 78° 19' E. long. It crosses the prov. in a N.E. direction, and falls into the Jumna, near Kalpee, in 26° 10' N. lat. and 79° 41' E. long. The Desan or Desan rises in the Vindhyan chain in Bhopaul, and flowing N.E. through Malwa, enters Bundelcund in 24° 12' N. lat. and 78° 47' E. long.; following the same course, it joins the Betwah near to its junction with the Jumna. The Ken or Cane rises in 23° 53' N. lat. and 80° 8' E. long., flows N.E., and enters Bundelcund in 24° 34' N. lat. and 80° 01' E. long.; its course is then N.E., and afterwards nearly due N., until it falls into the Jumna in 25° 47' N. lat. and 80° 28' E. long. Neither of these rivers is navigable. Some very large reservoirs have been constructed for purposes of irrigation in different parts of the country: these works must have cost immense labour.

The principal towns are Banda, the capital; Bejour, Jeitpore, Jhansi, Chatterpore, Callinger, and Tehree.

Banda is situated in 25° 30' N. lat. and 80° 20' E. long. about 90 miles W. from Allahabad. This town has much increased of late years, having, early in the present century, been only a village of moderate size. The cotton brought for sale to its market is of superior quality. Bejour is in 24° 38' N. lat. and 79° 27' E. long. Jeitpore is in 25° 17' N. lat. and 79° 32' E. long. Jhansi, the capital of a petty Boondela state under British protection, is situated in 23° 32' N. lat. and 78° 34' E. long. This is a considerable town, the centre of an active trade carried on between the Deccan and the towns of the Doab: it contains a considerable carpet manufactory, and large quantities of the warlike weapons used by the Boondela tribes, such as bows, arrows, and spears, are made there. Chatterpore, in 24° 56' N. lat. and 79° 35' E. long., is about 135 miles W.S.W. from the city of Allahabad: it was formerly a place of considerable trade, but has much decayed of late years. The manufacture of coarse cotton cloths, used for wrappers, is carried on there. Callinger is a fortified town in 25° 6' N. lat. and 80° 25' E. long.; it stands on a lofty mountain, the base of which is 10 miles in circuit. The walls include the whole summit of the hill, and are composed of rough uncut stones. The fortress was a place of great strength, and occasioned considerable loss to the British besieging army before it was

carried in 1812. The fortress was dismantled and the works were destroyed by the British government in 1820, at which time the town was of considerable extent. Tehree, or Teary, is on the N.W. frontier of Bundelcund, in 24° 43' N. lat. and 78° 52' E. long. This town is the residence of an independent Boondela chief or rajah, possessing several villages, and having a revenue of four lacs of rupees (40,000/).

The British connexion with the chiefs of Bundelcund originated in an arrangement concluded with the late Peishwa in December, 1803, by which he ceded to the British territory in that province of a certain value, which they were at liberty to select from those quarters of the province most contiguous to the British possessions, and the best suited to their convenience. In carrying this treaty into effect, arrangements were made with several chiefs on the frontier of the province, who were allowed to retain possession of the lands which they held. With some of these chiefs treaties still exist similar to those contracted with other protected states, except that they contain no stipulation for the payment of tribute; but the far greater number of Bundelcund chiefs, having been considered subjects of the Peishwa, are now considered British subjects. These chiefs have been guaranteed by the British in their possessions, and in return have subscribed engagements of allegiance and subjection. In general, the British government has allowed these chiefs to govern their territory as they pleased; but occasionally, during the minority of the chief, or when by misgovernment the country has been thrown into disorder, the government has exercised its sovereignty by appointing a manager.

The territory of Bundelcund has preserved its Hindu usages in a greater degree than most other parts of Hindustan that have come under foreign rule. Among the usages thus continued is the system of punchayet for settling disputes by arbitration under the superintendence of the Mocuddums or heads of villages. The selection of the arbitrators has always been made by the disputing parties, and they are chosen generally from the most respectable of the tribe or profession to which the parties belong. Disputes arising out of matters of account, and claims of bankers, are settled by arbitrators consisting of the most respectable persons of that profession; and the same practice is observed with regard to other professions. If the subject is rent, the head zemindars are generally chosen, and residents of neighbouring villages are commonly preferred to their own townsmen. Boundary disputes are settled in the same way, and a large assemblage from the surrounding villages are often invited to witness the settlement. This in former times has sometimes led to violent affrays, and has even occasioned the loss of lives, thus causing continual feuds, and laying the foundation for future disorders. Under these circumstances, the officers of the former government forbore to interfere, except the realization of the revenue was endangered, when their influence was interposed for the adjustment of the dispute. Under the immediate and active superintendence of European authority, such disorders have been suppressed. The greatest evil arising from this system of punchayet lies in the frequent failure of the award, from the want of power to enforce it.

BUNDER ABBAS. [GOMBROON.]

BUNGAY, a m. t. in the hund. of Wangford, Suffolk, on the Waveney, which surrounds it in the form of a horse-shoe. It is 31 m. N.E. of Ipswich, and 91 m. N.E. from London. Bungay is divided into two parishes, Holy Trinity and St. Mary, the combined pop. of which, in 1831, was 3734. The gross annual income of the living of St. Mary is 115*l.*; that of Holy Trinity, 30*l.*; both are in the diocese of Norwich. The market day is Thursday; there are two annual fairs on May 14th and Sept. 25th.

Bungay is a vil. of considerable antiquity, formerly dependent on Bungay Castle, supposed to have been erected by the Bigods, earls of Norfolk; some ruins of the castle still remain. There are also the ruins of a Benedictine nunnery. Bungay was nearly destroyed by a fire in 1688, and the town is consequently of modern date. There are two handsome crosses in the market-place. A considerable trade is carried on in grain and articles of provision, the Waveney being navigable up to Bungay for small barges.

A printing establishment here formerly had considerable reputation, and was a kind of depôt for the issue of publications and reprints of works in a cheap form.

Bungay has a free grammar school, endowed with a school-house and premises and two estates, from the proceeds of which ten children are educated; twenty-two daily schools; two boarding-schools; four Sunday schools; and one infant national school.

(Education Returns of 1835; Beauties of England and Wales; Pop. and Ecc. Returns.)

BUNKER'S HILL. [BOSTON.]

BUNTING. [EMERIZA.]

BUNYAN, JOHN, was born at Elstow, near Bedford, in 1628. His parents, who were of very mean condition, were Puritans, and Bunyan was strongly imbued with the principles of that sect. After being initiated in his father's profession as a tinker, he served in the Parliament army, and was present at the siege of Leicester, in 1645. Ten years afterwards, he was admitted member, and chosen preacher of a Baptist congregation at Bedford. At the Restoration, he was convicted of holding unlawful assemblies and conventicles, and sentenced to banishment. Until his transportation could take place, he was imprisoned, and he was not released until after a confinement of twelve years and a half, when Barlow, Bishop of Lincoln, applied in his favour. He maintained himself in gaol, during this most cruel persecution, chiefly by making tags and laces. After his release, upon the declaration of James II. for liberty of conscience, he resumed his occupation of preacher, at Bedford. He died in London of a fever, in 1688.

His works were collected in two volumes folio, 1736-7: among them the 'Pilgrim's Progress' has attained the greatest notoriety. If a judgment is to be formed of the merits of a book by the number of times it has been reprinted, and the many languages into which it has been translated, no production in English literature is superior to this coarse allegory. On a composition which has been extolled by Dr. Johnson, and which in our own times has received a very high critical opinion in its favour, it is hazardous to venture a disapproval, and we perhaps speak the opinion of a small minority when we confess that to us it appears to be mean, jejune, and wearisome.

BUNZLAU, a circle in the government circle of Liegnitz, and in the province of Prussian Silesia. Its area is about 422 square miles, and it contains two towns (Bunzlau and Naumburg on the Queis), a colony of Herrnhuthers, and 87 villages, with about 48,900 inhabitants. It is in general a flat country, and is watered by the Bober and Queis, neither of which streams is here navigable. It is full of forests, and has numerous low hills; it grows little grain but much flax, and large quantities of potatoes, vegetables, and fruit; and breeds numerous flocks and herds. The spinning of yarn and weaving of linen are carried on to a considerable extent.

The town of Bunzlau lies on the Bober, and is surrounded by a double line of walls and a deep ditch; it possesses three churches (one Lutheran and two Roman Catholic), an orphan asylum and school, an hospital, a seminary for teachers, and manufactures of woollens, linens, stockings, earthenware, &c. and has well-frequented markets for horses, cattle, and grain. Population about 4700. Much earthenware is exported. Topazes, agates, chalcedonies, and other valuable stones are found in the neighbourhood. It was the birthplace of Opitz, the poet, who died in 1639. About 150 miles S.E. of Berlin; 51° 15' N. lat., 15° 32' E. long.

BUNZLAU, a circle of Bohemia, which extends nearly from the centre of that kingdom to the confines of Saxony and Prussian Silesia in the N.W. and N.E. Its area is about 1617 square miles, and it contains 28 towns (among which are Yung-Bunzlau, Nimburg (2407 inhabitants), Reichenberg (11,500), Althaldorf (3600), Friedland (3100), Reichstadt (1900), and Gablonz (3250); 18 market villages, 1034 villages, and about 395,850 inhabitants. The principal river is the Iser, which traverses the country from the borders of Biczow and falls into the Elbe: the latter river skirts Bunzlau for a short distance in the S.W. The Giant Mountains (*Riesengebirge*) extend through its W. and N.W. districts and are covered with extensive forests, which yield much timber and potashes. In this part there are some iron mines and glass-works, as well as a considerable growth of flax. The plains are sandy and destitute of water; yet they have been rendered very pro-

ductive in grain, fruit, and hops: a small quantity of wine is also made. Bunzlau is full of manufactures, particularly of yarn, linens, cottons, woollens, glass, and paper: these are principally carried on in the mountainous districts, which are extremely populous. Some gold and silver is also obtained, together with semi-precious stones.

YUNG-BUNZLAU, the capital of this circle, is situated on a hill, the base of which is skirted by the Iser, and contains about 500 houses and 4950 inhabitants. It is well built, and has a handsome town-hall, a castle now used for barracks, six churches, some of them handsome structures, two monasteries, a gymnasium and head-school (*hauptschule*), an hospital, and besides an extensive cotton factory, manufactures of woollens, leather, soap, &c. It is said to have been founded by King Boleslaf in 975; at least its Bohemian name of 'Mlada Boleslaf' is derived from that monarch. 50° 23' N. lat., 14° 55' E. long.

BUONAFEDE, APPIANO, born in 1716 at Comacchio in the papal state, entered the order of the Celestines, in which he rose gradually to the highest dignities. He was elected general of the whole order in 1777, in which capacity he went to pay his homage to the king of Naples as feudatory of the crown for several fiefs which the Celestines possessed in that kingdom. He spent the latter years of his life at Rome, where he died in December, 1793. He wrote several works, especially philosophical speculations, and the history of philosophy ancient and modern. 1. 'Della Istoria e della Indole d'ogni Filosofia,' Lucca, 7 vols. 8vo. 1781. This work treats of the philosophy of the ancients and that of the middle ages till the 15th century. 2. 'Della Ristaurazione d'ogni Filosofia nei secoli xvi., xvii., and xviii.,' 3 vols. 8vo. Venezia, 1786-9. This work was translated into German by Heydenreich, with many additions, under the title, 'Agatopisto Cromaziano's Kritische Geschichte der Revolutionen der Philosophie in den drey letzten Jahrhunderten,' Leipzig, 1791. Buonafede had assumed in the Society of the Arcadi the academical name of Agatopisto Cromaziano, under which most of his works were published. His is the only history of philosophy written in Italian. The style is fluent and pleasing, and well adapted to popular reading; but the matter of the work displays more historical learning than searching criticism. Buonafede's judgments are mostly impartial and independent, as much perhaps as could be expected from one of his profession, and from the times and place in which he wrote. It is a curious though by no means singular instance of the contradictory judgments passed upon writers on polemical subjects, that while Buonafede was looked upon in high quarters at Rome as being too favourable to what was called the philosophy of the 18th century, on which account it was said he never obtained a cardinal's hat, though he had long aspired to it; others, and his biographer among the rest, have taxed him with monkish intolerance, and with being too subservient to the court of Rome. Buonafede wrote also, 3. 'Dello conquisto celebri, esaminate col natural diritto delle genti,' 8vo. Lucca, 1763. 4. 'Storia critica e filosofica del suicidio ragionato,' 8vo. Lucca, 1780: an investigation of the circumstances which have attended many cases of suicide recorded in history. 5. 'Ritratti poetici, storici, e critici di varj moderni eomimi di lettere,' in a series of sonnets, with interesting biographical notes. The author has traced his own moral portrait among the rest. 6. 'Storia critica del moderno diritto di natura e delle genti,' Perugia, 1789; 7. 'Del Pirronismo teologico e politico'; 8. 'Dell' apparizione di alcune ombre'; 9. 'I filosofi fanciulli,' a satirical comedy after the manner of Aristophanes; 10. 'Orazione per le belle arti'; 11. 'Della libertà poetica, epistola.' These two little works are remarkable for good taste and bold criticism. 12. 'Discorsi della malignità storica, or strictures on Sarpi's history of the Council of Trent'; 13. 'Della impudenza letteraria,' being a sharp review of the biographical memoirs of the same Sarpi written by Grisolini. Buonafede's criticisms were in general bitter and virulent, as an example of which we cite the 'Bue Pedagogo,' which he wrote against Barretti. (Ugoni, *Della Letteratura Italiana*; Mazzuchelli, *Scrittori d'Italia*; *Elogio Storico di Agatopisto Cromaziano*, Venezia, 1795.)

BUONAROTTI, M. ANGELO. [ANGELO, MICHAEL.]

BUONAPARTE. [BONAPARTE.]

BUOYS.—French, *Bouées*; German, *Ankerbojen*; Dutch, *Ankerbonien*; Danish, *Ankerbojer*; Swedish, *Ankerbojor*; Italian, *Garitelli*; Spanish, *Boyas*; Portuguese, *Boias*,—

are vessels formed of wood, cork, or some other substance which is specifically lighter than water. They are moored or anchored so as to float on the surface of the water at some certain spot, in order to point out the course or channel that a vessel should follow. Buoys are also used for the purpose of marking the situation of ships' anchors, to which they are attached, and thus facilitating the future recovery of the anchor and cable in cases where the latter has been broken, or where it has been cut, in order to provide on emergencies for the safety of the ship, when time or other circumstances do not admit of the anchor being weighed into the vessel. The first description of buoys are denominated public, and the last private buoys. Another kind of buoys are those placed in harbours to mark the situation of mooring chains to which ships frequenting the port are made fast.

Until the 36th year of Queen Elizabeth all public buoys in this kingdom were under the management of the Lord High Admiral, but in that year (1594) the queen, by a warrant dated 11th of June, granted to the corporation of the Trinity-house of Deptford-strond the right of 'making, erecting, setting up, placing or laying out, all buoys, beacons, marks and signs for the sea or sea-shore, to hold the same with all profits and emoluments thereunto belonging, as of the manor of East Greenwich, in free and common socage.' On laying down any public buoy, the officers of the Trinity-house corporation gave notice to the public of its form, colour, and exact situation, and of the reason for its being laid down; and notifications are also made upon their removal, whether the same arises from design or through accident. By the act 6 Geo. 4. c. 125, it is provided, 'that every person who shall ride by, make fast to, or remove, or wilfully run down or run foul of any vessel placed to exhibit lights, or any buoy or beacon belonging to, or placed by, any corporation or society having lawful authority to place the same, shall, besides being liable to the expense of replacing or making good any damage occasioned thereby, forfeit for every such offence any sum not exceeding 50*l.*, nor less than 10*l.*' The amount of revenue annually collected for the use of buoys by the Trinity-house corporation is between 11,000*l.* and 12,000*l.* The charge made is according to the tonnage of the vessels frequenting the ports in or leading to which buoys are placed: the rates vary according to circumstances, and are highest in the port of London, where British and foreign *privileged* vessels (those belonging to countries with which we have 'reciprocity treaties') pay one penny per ton, and foreign vessels not privileged pay two-pence per ton.

Protection is given to private buoys by the 1st and 2nd Geo. 4. c. 75, in which it is enacted, that 'if any person shall wilfully cut away, cast adrift, remove, alter, deface, sink or destroy, or in any way injure or conceal any buoy, buoy-rope, or mark, belonging to any ship or vessel, or which may be attached to any anchor or cable belonging to any ship or vessel, whether in distress or otherwise, such person so offending shall, upon conviction, be adjudged guilty of felony, and shall be liable to be transported for any term not exceeding seven years, or to be imprisoned for any number of years, at the discretion of the court.'

BU'PALUS (*Leach*), a genus of lepidopterous insects, of the family geometridæ. Technical characters:—palpi very short: antennæ, in the males, pectinated on each side to the apex; in the females simple: wings erect during repose; the anterior wings in the males having a protuberance at the base. Larva smooth and furnished with ten legs.

B. piniarius (called the *bordered white* by Haworth) is a beautiful moth, which, when the wings are expanded, measures rather more than an inch in width. Its wings on the upper side are of a dusky brown colour, and adorned with numerous pale yellow spots; and beneath clouded with the same dusky colour and having two brown stripes. The caterpillar is green, with a white longitudinal stripe down the middle of the back, and four other stripes of a yellowish colour placed two on each side of this. It feeds upon the *Pinus sylvestris* and *P. abies*; in the neighbourhood of which species of firs the moth is not uncommonly seen flying during the daytime. (Stephens's *Illustrations of British Entomology*.)

BU'PHAGA (*Zoology*), Buphagus, Brisson, a genus of birds whose form, admirably adapted to their manner of life, in some points resembles that of the merulidæ (black-birds), while its habits approach those of the sturnidæ (starlings); but the form, notwithstanding, presents such

strong points of difference, that most ornithologists agree in viewing it as the type of a family, Buphagidæ, of which at present one genus only, that named at the head of the article, containing two species, is known. The following is Temminck's generic character:—

Bill strong, large, obtuse, nearly quadrangular; lower mandible stronger than the upper; both swollen towards the point.

Nostrils basal, oval, half closed by a vaulted membrane.

Feet moderate; shank (*tarsus*) longer than the middle toe; three toes before, one behind, the lateral toes equal, the external toe conjoined at the base, the internal one divided; claws hooked, compressed.

Wings moderate; the first quill very short, the second nearly the length of the third, which is the longest.

The only two species known live principally upon those parasitic insects, the larvæ (maggots) of which are hatched under the skin of some of the larger ruminants and birds, a mode of life which is followed by some of the crows (*corvidæ*) and the pastors. The quadrupeds on whom the Buphaga waits are principally those of the ox family, the antelopes, and the camels, and, generally, the other ruminants both wild and tame. Fixed on the backs of these by his cramp-irons of claws, the *Beef-eater*, as he has been called by the English, and *Pique-bœuf* by the French, digs and squeezes out with his forceps of a beak the larva that lies festering under the tough hide of the quadruped.

Le Vaillant gives the following account of the habits of *Buphaga Africana*, which is distributed through southern Africa, and found also at Senegal. The bill of the *Pique-bœuf* is fashioned as a pair of solid pincers to facilitate the raising up out of the hides of quadrupeds the larvæ of the gadflies, which are there deposited and nourished: the species, therefore, anxiously seeks out the herds of oxen, of buffaloes, of antelopes—of all the quadrupeds, in short, upon which these gadflies deposit their eggs. It is while steadied by a strong gripe of the claws in the tough and hairy hide of those animals that, with strong blows of the bill and powerful squeezes of the skin, at the place where the bird perceives an elevation which indicates the presence of a maggot, he extracts it with effort. The animals, accustomed to the treatment, bear with the birds complacently, and apparently perceive the service which they render to them in freeing them from these true parasites, which live at the expense of their proper substance. The *Pique-bœufs* however are not the only birds that perch upon the backs of quadrupeds and large birds, for many other omnivorous species have the same habit; but these last content themselves with only taking away the parasites which are attached to the skin of those animals, not having in their bills the necessary strength for extirpating the larvæ which are lodged beneath it; an office which the *corvus albicollis* (Le Corbivau) executes as well as the *Pique-bœufs*.

The *Pique-bœufs* are generally seen in company, but they never fly in large flocks. Le Vaillant rarely saw more than six or eight in the same herd of buffaloes or antelopes; and M. Rüppell never observed them except in bands consisting but of few individuals about the camels of his caravan. They are very wild and difficult of approach, so that there is no chance of obtaining either the one or the other species except by hiding behind an ox or a camel and driving it gently, in the manner of a stalking horse, towards those beasts on whose backs the birds are perched. When sufficiently near, the fowler shows himself, and brings them down while on the wing. Besides the larvæ of the gadfly, these birds eat the ticks when they are full of blood, and all sorts of insects generally.

We select as an example *Buphaga erythroryncha* (*erythroryncha*), the species last recorded, described by Temminck and received by him some years since from the Cape of Good Hope, whither it had been brought with a small number of other species from Madagascar. Many since that time have reached Europe, part of the fruits of the travels of Ehrenberg and Rüppell in northern Africa. 'Notre *Buphaga erythroryncha* du voyage de Salt, says Temminck, is distinguished from its congener by a smaller and less powerful bill, by the red colour of that organ (whence it is called in French *Pique-bœuf*, *Bec-coral*—Coral-bill, Beef-eater)—by the more sombre tints of its upper plumage, and, finally, by its smaller proportions. The upper parts, head, and throat in the adult are ash-brown, glazed as it were with bluish; the lower parts are yellowish-rust or dark isabella-colour. The total length is

seven inches, about one-third less than *Buphaga Africana*, whose bill is yellow, and whose geographical distribution seems to lie in the southern districts and on the western coasts, parts of the country to which Temminck expresses his belief that *Buphaga erythroryncha* does not penetrate. Temminck, from whose work our figure and description are taken, says that no particulars as to the structure of the nest, its position, or the period of incubation, are yet known.

[*Buphaga erythroryncha*, male.]

BUPRESTIDÆ (Leach), a family of coleopterous insects of the section Pentamera and subsection Sternoxi (Latreille). The section Sternoxi is composed of two great groups or families, the one of which we are about to treat (Buprestidæ), and the Elateridæ: the species of the former group are distinguished from the latter principally in having the tarsi dilated (the penultimate joints of which are bilobed) and furnished beneath with velvet-like pellets: the thorax nearly straight behind, and the mandibles entire, *i. e.*, without any notches internally near the apex—and likewise in having the terminal joints of the palpi cylindrical, or nearly so.

The form of the body in the Buprestidæ is somewhat ovate, the apex of the elytra being more or less pointed, and the base of the thorax of nearly equal width with that of the elytra: the head is placed almost vertically, and is deeply inserted into the thorax, so that the eyes nearly come in contact with that part.

In splendour of colouring, this family of insects surpasses all others among the Beetle tribe, the Cetoniadæ perhaps excepted: green appears to be the most frequent colour, but shades of blue, red, golden or copperlike hue are not uncommon, and these colours are in most cases brilliant or, as it were, burnished.

The Buprestidæ are found on the trunks and leaves of trees, and likewise on flowers (on the latter, more particularly the smaller species), and when touched, or frequently even when approached, they apply their legs and antennæ close to the body, and allow themselves to fall to the ground, a means of escape frequently practised by insects: they crawl slowly, but in hot sunny weather are frequently on the wing and fly rapidly.

About 500 species have been discovered belonging to this tribe, which are for the most part from the tropics. In this country about twenty have been found at large, of these however several have most probably been imported with timber in which their larvæ feed.*

The genus Buprestis, which is now only restricted to a

* An instance is recorded by Mr. Marshall, in the 10th vol. of the 'Linnæan Transactions,' of one of these insects eating its way out of a desk which had been in Guildhall for 29 years; and there are reasons for believing that the insect must have been in the desk during the whole of that time, and the greater part probably in the larvæ state.

† The name Buprestis (*Bolagrenis*) was applied by the authors to certain

few of the species of this family, is distinguished principally by the following characters:—Antennæ serrated from the third fourth joint to the apex; labrum attenuated and slightly emarginated anteriorly; scutellum distinct; body nearly ovate.

BURA, one of the twelve cities of Achæa, situated on a hill nearly forty stadia from the sea. When Helice, another of the Achæan towns, was swallowed up with all its inhabitants by a great earthquake, accompanied by an inundation of the sea, Bura also was shaken so violently that the statues in the temples were thrown down. All the inhabitants perished except such as happened to be absent on military service or for other reasons, who formed the future population of Bura. (Herod. i. 145; Pausanias, vii. 25; Strabo, pp. 54, 59, 386, Casaub.)

[Coin of Bura. Brit. Mus.]

BURBAGE, or BURBADGE, RICHARD, the original performer of the principal tragic characters of Shakspeare, was the son of James Burbage or Burbadge, also an actor, and it is presumed a countryman of Shakspeare's, and to whom, with four others, Queen Elizabeth granted, in 1574, the first royal patent conceded in this country to performers of plays. James Burbadge built the Blackfriars Theatre in 1576, and in 1596 we find the name of his son Richard appended with Shakspeare's to a petition to the Lord Chamberlain to be allowed to continue their performances therein. In 1603 'Richard Burbage' is one of the actors included in the license granted by King James I. to Lawrence Fletcher, William Shakspeare, and others. In March, 1615, we find him and other 'stage players' summoned to appear before the privy council for disobeying a special order of the Lord Chamberlain, prohibiting the acting of plays during Lent; and in 1620 his name is again mentioned in the grant of a new patent by King James licensing his 'well-beloved servants to act, not only at the Globe, on the Bankside, but at their private house situate in the precincts of the Blackfriars; but he is said to have died on or about the 13th of March in that year, and the patent bears date the 27th. He was buried in the church of St. Leonard, Shoreditch, having resided in Holywell Street in that parish from the year 1600. His will is still extant in the Prerogative Office, but it contains nothing remarkable. By his wife, Winifred, he had four daughters, two of whom were christened 'Juliet,' his partiality for that name arising, it has been supposed, from his having been the original performer of Romeo. Richard Burbadge is introduced in person in an old play called the 'Returne from Parnassus,' and instructs a Cambridge scholar how to act the part of Richard III., in which character he appears to have been greatly admired. Bishop Corbet, in his 'Iter Boreale,' speaking of his host at Leicester, says,

'When he would have said King Richard died,
And called "a horse, a horse," he Burbage cried.'

In the 'Gentleman's Mag.' for 1825 there is an elegy on the death of R. Burbadge, long preserved in MS., and Mr. Payne Collier, in his 'Annals of the Stage,' quotes another copy, subsequently found with the important addition of some lines naming four of the parts in which Burbadge especially excelled, viz., Hamlet, Hieronimo, Lear, and probably Othello. According to the anonymous author Burbadge's disorder first attacked his speech, and he thus adverts to the loss the stage sustained by his decease:—

'He's gone, and with him what a world are dead,
Which he revived to be revived so;
No more young Hamlet, old Hieronimo,
King Lear, the cruel Moore, and more beside,
That lived in him, have now for ever dyed.'

Insects, when they eaten by the cattle whilst grazing, created inflammation, &c. There is no doubt however that those insects belonged to a tribe differing from that to which the term Buprestis is now applied. Various have been the conjectures on this subject. The opinion of Messrs. Kirby and Spence is, that the Buprestis of the ancients was a species of the genus Mylabris. (See Introduction to Entomology, vol. i., p. 156.)

The whole elegy extends to 86 lines; it ends thus.—

'And thou, dear earth, that must enshrine the dust
Thy heaven now committed to thy trust,
Keeps it as precious as the richest mine
That lies intomb'd in the rich womb of thine;
That after times may know that much-loved mould
For others dust, and cherish it as gold.
On it be laid some soft but lasting stone,
With this short epitaph endor'd thereon,
That every one may read, and reading weep,
"Ths England's Rascals, Burbadge, that I keepe!"

A shorter epitaph is however accorded to him in Philpot's additions to Camden's Remains, more concise even than the well-known one of Ben Jonson, being simply 'Exit Burbadge.'

Flecknoe, in his short discourse of the English stage, 1664, speaks most highly of his abilities, and a similar testimony is paid to them by Sir Richard Baker. The former calls him 'a delightful Proteus,' the latter pronounces him to have been 'such an actor as no age must ever look to see the like.'

Burbadge is said to have possessed also considerable talent as an artist. In the 'New Particulars concerning Shakspeare' lately published by Mr. Payne Collier allusion is made to the fact, and the portrait of Shakspeare (commonly called the Felton), now in possession of Mr. Nicol of Pall Mall, is, from the circumstance of the initials R. B. on the back of it, supposed to be his painting.

(Annals of the Stage, and New Particulars, &c. by J. P. Collier; Flecknoe's Short Discourse, 1664; Bishop Corbet, Iter Boreale, &c.)

BURCKHARDT, JOHN LEWIS, was born at Lausanne, in Switzerland, about the year 1784. His father, who was of an ancient family of Basle, being obliged to leave Switzerland in 1798 in consequence of the French invasion, entered a Swiss corps then serving in Germany in the pay of England. In the year 1800 young Burckhardt went to study at Leipzig, from whence he afterwards removed to Göttingen. Having left Göttingen he came to England in 1806, with recommendations to Sir Joseph Banks, then an active member of the committee of the African Association. The association having lost all hopes of receiving intelligence from Mr. Hornemann, who had attempted to penetrate into Central Africa by the way of Fezzan, resolved to send another traveller in the same direction. Burckhardt made an offer of his services, and his offer was accepted in 1808. Meantime he had been preparing himself by studying Arabic and attending lectures on chemistry, astronomy, medicine, and surgery. In January, 1809, he received his instructions from the committee: he was to proceed first to Syria, there to remain two years to perfect himself in the Arabic, and afterwards to proceed by Cairo to Mourzook in Fezzan, from whence he was to cross the great desert to Soudan. He arrived at Malta in April, 1809, and reached Aleppo in September, having first assumed the eastern dress and the name of Ibrahim. From Aleppo he made several journeys to Damascus and Palmyra, and into the Haouran, and among a tribe of Turkmans who live to the N.W. of Aleppo. He also gained much information concerning the Bedoween tribes of Syria and Arabia, and concerning the Wahabees, who were then making incursions near to the gates of Damascus. After remaining two years and a half in Syria, Burckhardt proceeded towards Egypt by Palestine and the country east of the Dead Sea, and then by the great valley of Ghor or Araba, which extends from the southern shore of the Dead Sea to Akaba on the Elanitic gulf of the Red Sea. This interesting valley and the neighbouring monuments of Wadi Mousa had been unexplored by former travellers. Burckhardt did not go as far as Akaba, but struck across the desert to Suez, and thence to Cairo, where he arrived at the beginning of September, 1812. As there was no favourable opportunity of proceeding to Fezzan for the present, Burckhardt set off for Upper Egypt and went into Nubia, where no European traveller had ever been beyond Derr. He left Assouan towards the end of February, 1813, and passing the cataract of Wadi Halfa, went as far as Tinareh in the country of Mahass, and on his return visited the temples of Abousambul, Dandour, Gyrshé, Kalabshe, &c. He passed the rest of that year in Upper Egypt, and on the 1st March, 1814, set off from Darnaou with a caravan which was proceeding to Upper Nubia across the desert east of the Nile. In this journey he followed nearly the same track as Bruce on his return from Abyssinia. After suffering much through the desert,

he arrived in the country of Berber, and thence went to Shendi. At Shendi he set off with a caravan for Suakin on the Red Sea. After having forded the Atbara (the Abyssinian Tacazze) above its junction with the Mogren, a river that rises in the mountains of the Bishareen, and which after its confluence with the Atbara gives its name to the united stream which flows into the Nile, he proceeded to Taka, a remarkably fertile and populous district in the midst of the desert. Its fertility is owing to the periodical inundations of large torrents coming from the S. and S.E. (probably the Abyssinian Mareb). Burekhardt gives an interesting account of Taka and of the country of Beja, of which it forms part, and which to the S. borders upon Abyssinia. [B.K.A.] Taka was the most southern point of Burekhardt's travels. He thence proceeded N.E. and crossing the Langay Mountains, arrived at Suakin towards the end of June. From Suakin he sailed for Jidda, where he arrived in July, 1814.

These two Nubian journeys of Burekhardt, the journals of which were published together in one volume, furnished much interesting and for the most part novel information. The appendix contains also many valuable notices on Borgo, Bornou, and other countries of Soudan west of Darfur, which Burekhardt collected in Egypt and Nubia, as well as extracts from Makrizi and Ibn Batuta.

From Jidda Burekhardt proceeded to Tayf, five days' journey inland, where he found Mehemet Ali, who after having taken possession of Mecca and all the Hejaz, was preparing an expedition into the Nejd, the country of the Wahabees. The pasha, who had known Burekhardt at Cairo, received him favourably, and he was also fortunate in obtaining a supply of money from the physician of Tousoun Pasha, Mehemet Ali's son.

Burekhardt next visited the city of Mecca, which till then had been forbidden ground to Europeans, and went through the whole of the ceremonies in the character of a Mussulman pilgrim, without, as he believed, having excited any suspicion as to his real character. He spent three months at Mecca; and on the 25th of Nov., 1814, performed the hadji or pilgrimage to mount Arafat, in the company of more than 80,000 pilgrims from all parts of Islam. In Jan., 1816, he visited Medina, a city of which still less was known in Europe than of Mecca. He felt ill at Medina, and after some months, having recovered sufficient strength, he went to Yembo, where he embarked for Tor, in the peninsula of Sinai, and thence returned by Suez to Cairo in June, after an absence of nearly two years and a half, of which he had spent nine months in Arabia.

The particulars of Burekhardt's Arabian journey furnished the most complete account of the Hejaz and its two holy cities Mecca and Medina, ever transmitted to Europe. Ali Bey (the Spaniard Badia) had visited Mecca a few years before Burekhardt, who said that he had no reason to doubt his general veracity, though his description of Mecca was incorrect in some points, and his information rather superficial. Ali Bey spoke only the Moghrebin or western Arabic. Seetzen, a German traveller, sent by the Duke of Saxe-Gotha, and of whom Burekhardt speaks with great respect, travelled in Arabia about the same time as Ali Bey, and died of poison at Mocha, in 1811. Since Burekhardt, Mecca and Medina have been visited by several Europeans in the service of Mehemet Ali. (Planat, *Régénération de l'Egypte*, with a plan of Mecca.)

One of Burekhardt's objects in visiting Mecca as a pilgrim was to be enabled to assume the title of Hadji, which he conceived would prove of great advantage to him in his travels in the interior of Africa. But his residence in Arabia undermined his constitution, and he never recovered from the effects of the deleterious climate and unwholesome water of that country. He spent the following nine months after his return from Arabia partly at Cairo and partly at Alexandria, endeavouring to recruit his health impaired by repeated attacks of fever, and preparing his Nubian and Arabian journals to be sent to the Association. In April, 1816, the plague having broke out at Cairo, he set off for the desert of Sinai. He visited that mountain, as well as the shores of the Euxine gulf, and returned to Cairo about the middle of June. Here he proposed to Mr. Salt the project of removing the head of Memnon from Gournah, and having it conveyed to England as a present to the British Museum: for which purpose they engaged, at their joint expense, Belzoni, who accomplished its removal to

Cairo. [BELZONI.] Burekhardt remained at Cairo waiting for the long-expected caravan from Fezzan, with which he intended to proceed on its return to that country. For several years past no caravan from Fezzan had made its appearance at Cairo. In Oct., 1816, he forwarded to the Association his 'Notes on the Bedoweens and the Wahabees,' which were afterwards published in a separate volume, and contain much new information. Burekhardt felt a peculiar interest for the Bedoweens of Arabia, whom he considered 'as the original stock from which the Arabian population of Syria, Egypt, and Barbary is derived; and also as the only Mohammedan nation who in the midst of the utter depravity of manners and morals, and the decline of laws and civil institutions throughout the Mohammedan world, have preserved unchanged their ancient customs and the manners of their forefathers, and still continue to be what they were 1200 years ago, when their emigrating tribes conquered part of Asia, Africa, and Europe.' (Burekhardt's *Letter from Cairo*, 15th of Oct., 1816, inserted in his life.)

In the autumn of 1817 it became known at Cairo that among the pilgrims collected at Mecca that year was a party of Moghrebins or western Africans, who were to return home by way of Cairo and Fezzan; and it was believed that the caravan would take its departure from Cairo about December. Burekhardt had now transmitted to England all his journals, and was contemplating with the greatest satisfaction the moment when he was at last to set out on the main object of his mission, for which he had so long and so assiduously been preparing himself. But at the beginning of October of that year he fell ill at Cairo of the dysentery, and notwithstanding every medical assistance, he expired in the night of the 15th. He communicated his last intentions to Mr. Salt, in a composed and collected manner. His last words were about his mother, when he became strongly affected. 'As for my body,' said he, 'I know the Turks will have it (as he had passed in Egypt for a Mussulman); perhaps you had better let them.' Accordingly he was buried as the Mohammedan sheik Ibrahim, and his funeral was conducted with all proper regard to the respectable rank which he had held in the eyes of the natives. He had won the universal esteem of both Christians and Mussulmans. His death, at the early age of 33, when he had so well fitted himself for the purposes of African discovery, was greatly deplored in Europe. Burekhardt's personal character stood deservedly high, as any one who peruses the extracts of his correspondence with the Association, and the account of his last interview with Mr. Salt, both inserted in his life, must feel convinced. (See also Salt's *Correspondence in Hall's Life of Salt*.) He left his collection of Oriental MSS. to the University of Cambridge. His journals were published after his death by the African Association. They consist of—1. 'Travels in Nubia,' 4to., 1819, with a 'Life of Burekhardt'; 2. 'Travels in Syria and the Holy Land,' 4to., 1822; 3. 'Travels in Arabia,' 2 vols. 8vo., 1829; 4. 'Notes on the Bedoweens and the Wahabees,' collected during his travels in the East, 4to., London, 1830.

BURDWAN, one of the 17 districts into which the province of Bengal is politically divided, is situated to the west of the river Hoogly, between 22° and 24° N. lat., and 87° and 89° E. long. Burdwan is bounded on the north by Birbhoom and Rajshahi, on the west by Midnapore and Ramghur, on the south by Midnapore and Hoogly, and on the east by the last-named district and Nuddea. Its area, which is computed at 2400 square miles, is covered with a dense population. A census taken in 1814 established the fact that the district then contained 262,634 dwellings, of which 218,853 were occupied by Hindus, and 43,781 by Mohammedans. Computing the number of each family at five and a half persons, the average rate in that part of India, the total population of Burdwan must at that time have amounted to 1,444,487 souls, of whom five-sixths were Hindus, and one-sixth Mohammedans. The population thus ascertained gives an average of 692 persons to each square mile, being three times the average proportion in the United Kingdom.

The district of Burdwan, which forms part of the valley of the Ganges, is a level tract. The principal river flowing through it is the Damooda, which enters the district at its western extremity, flows east to the town of Burdwan, and then making an abrupt turn to the south, joins the Hoogly a few miles below Fulta. Except for a short time

during the rainy season the Dummooda is not navigable, but the district being well provided with roads, the deficiency of water-carriage is of less importance.

The greater part of the soil is very fertile, and produces abundant crops of sugar, indigo, betel, tobacco, and cotton, besides the cereal grains usually cultivated in Bengal. A considerable quantity of silk is likewise produced. Compared with the surrounding districts, Burdwan has the appearance of a garden.

The native zamindars are generally wealthy; the more considerable of them usually reside in Calcutta, leaving their properties to the management of resident agents. An extensive trade is carried on by native merchants.

The rajah of Burdwan is the most considerable zamindar under the Bengal presidency, his annual jumma or rent amounting to 40 lacs of rupees (400,000*l.*), which amount is said to be less than one-half of the sum collected by him from his tenants. These tenants form a numerous class, who, like the *middlemen* in Ireland, have divided their holdings among sub-tenants, reserving a profit-rent to themselves. These sub-tenants, imitating the example of those above them, have again divided their farms among persons who have made yet another division, so that there are five removes between the ryot or actual cultivator and the supreme government, while each of the intermediate tenants derives a profit from the land. The individuals forming the several links of this chain are all considered to have a permanent possession of their leases, which descend as of right to their heirs. This permanency, as regards the ryots, is of recent introduction, and is owing to the interference of European officers, who have put a stop to a system which prevailed of ejecting them if they did not agree to pay exorbitant rates.

Coal-mines have been worked in this district for nearly 20 years, but the operations have not been extensive for more than half that period. The extent of the coal-field has not been ascertained, but is known to be great; the mines now worked are in the possession of an English company, whose rights extend over 4 miles of surface. The seam is 9 feet thick, and is found 90 feet below the surface. The annual produce is from 14,000 to 15,000 tons; and the works being situated on the bank of a river connected with the Hoogly, the coals are conveyed in the rainy season down that river to Calcutta, where they are sold at 20*s.* the chaldron. The quality of the coal is inferior to that of England, which sells in the same market at from 30*s.* to 40*s.* per chaldron. Coal is still but little used for culinary purposes in India. The Burdwan coal is chiefly used for steam-engines, and it has lately been applied to the burning of bricks; some of it is exported to Singapore.

The town of Burdwan, the capital of the district, and the residence of the British agent, is situated in 23° 15' N. lat., and 87° 57' E. long., about 60 miles N.N.W. from Calcutta. At the census of 1814 it was found that this town contained 9805 houses, the number of persons inhabiting which, according to the mode of calculation usually adopted, was 53,927. The proportion of Mohammedans was greater in the town than in the entire district, having been 11,847, or about two-ninths of the whole number of inhabitants. The rajah of Burdwan resides in the town, in which he has a palace with large gardens.

(Rennell's *Memoir of a Map of Hindustan*; *Rep. of Committee of House of Commons*, 1830 and 1832.)

BURETTE, an instrument in chemistry, invented by M. Gay Lussac, for the purpose of dividing a given portion of any liquid into 100 or 1000 equal parts. It is accompanied by a cylindrical glass measure, containing, when filled to the line A, $\frac{1}{2}$ litre; and if the fluid to be divided be less than this quantity, the deficiency must be supplied by water. In filling this measure, it is the surface of the fluid which must be made to coincide with this mark, and not the outer margin elevated by capillary attraction above the general level. The burette consists of a large tube graduated into 100 equal parts (in the figure only half the number of the small divisions are represented), and numbered from the top downward; and of a small tube connected with the former at the base, and recurved at the top. Through this tube, if the beak be slightly greased, the contents of the large tube may be poured with great precision, either by single drops or in a full stream. The largest divisions are 1-100 of the large measure, and the smallest 1-1000, and these may be subdivided by counting the number of drops of the fluid under examination, which

are poured out in reducing the surface of the liquid from any division to the next inferior one. The superiority of the burette over other measures consists in the decimal arrangement of the graduations, and the great rapidity and precision with which any required portion of a liquid may be added or abstracted, while one hand only is employed, the other being left at liberty to use the stirring rod or test paper.

The burette, though applicable to the processes of the analytic chemist, is a very useful instrument in manufactories where the value of numerous samples of acids, alkalis, bleaching powder, &c. has to be quickly and correctly ascertained: though in general use in France, it is almost unknown in this country. (*Essai des Potasses*, par M. Gay-Lussac; *Instruction sur l'Essai du Chlorure de Chaux*, par M. Gay-Lussac.)

BURFORD. [OXFORDSHIRE.]

BURG, a town in the circle of Jerichow I., in the Prussian province of Saxony, is situated on the Ihle or Ehle, and surrounded by a wall with five gates. It contains three squares or public places, three Lutheran churches, and one Calvinistic church with a French pastor, one civic school of the first class (*höhere Bürgerschule*), an hospital and a poor-house, about 1130 houses, and 12,800 inhabitants, among whom are a number of settlers from the French, Palatinate, and Swiss territories. In 1817 the population was 9101. Burg has considerable manufactures, particularly woollens, which employ upwards of 1300 hands, and produce annually above 70,000*l.* in value of that article. Yarn and linens, pottery, &c. are made; it has also some tanneries and dyeing works and a brisk wool trade. Agriculture, including the growth of tobacco, hops, and chicory, and the rearing of cattle and sheep, are carried on with success in the immediate environs. Most of the manufacturers in the place are the descendants of French emigrants. It is the seat of civil and judicial administration for the circle. About 75 miles S.W. of Berlin.

BURGE TENURE denotes the particular feudal service or tenure of houses or tenements in ancient cities or boroughs. It is considered to be a species of socage, as the tenements are holden of the king or other lord, either by a certain annual pecuniary rent, or by some services relating to trade or handicraft, such as repairing the lord's buildings, providing the lord's gloves or spurs, &c., but 'no way *smelling* of the plough or tillage' (Somner on *Gavelkind*, 142-148), and having no relation to military service (Spelman's *Glossary*, *ad verbum*). The incidents of this tenure, which prevailed in Normandy as well as in England, vary according to the particular customs of each borough, in consequence of the maxim that, in improper feuds (to which class this tenure belongs), the *lex et consuetudo loci* are always to be observed. (Wright's *Tenures*, p. 205.)

Burgage tenure is supposed by Littleton and other writers to have been the origin of the rights of voting for members of parliament in cities and boroughs; and the great variety of those rights is in some measure accounted for by supposing them to be founded upon varying local customs. It is however impossible to trace the gradual steps by which the irregular rights of voting in boroughs for members of parliament, which are continued by the reform act (2 Will. IV. c. 45) until the extinction of existing interests, were derived from burgage tenure.

BURGEON, or **BOURGEOIN**, an obsolete English and modern French name of a leaf **BUR**.

BÜRGER, **GOTTFRIED AUGUST**, the son of a clergyman, was born at Walmerswende, near Halberstadt, in January, 1748. While at school he showed no aptitude for grammatical studies, but a great liking for poetry. In 1768 he went to Göttingen, where he wasted his time and money in dissipation, in consequence of which his friends withdrew their assistance from him. But having formed an intimacy with several distinguished fellow-students, Voss, Count Stolberg, Sprengel, and others, who had established a literary club for their mutual improvement, Bürger, encouraged by them, began to mend his course of life, and to apply himself earnestly to the study of the classics as well as the modern poets. Among the latter Shakespeare became his favourite. Some ballads which he wrote at that time having attracted notice, he obtained a situation at Alten Gleichen, and his grandfather agreed to pay his debts and to give him further assistance, but through the dishonesty of a friend Bürger lost the money. An imprudent marriage increased his embarrassments. He however soon after separated from his wife, and went to live at Göttingen, where he passed the remainder of his life, first as a private teacher, and afterwards as professor of philosophy, but without any fixed salary. His misfortunes imparted a tinge of melancholy to several of his poetical compositions. After lingering some years in bad health and poverty, he died in 1794. He published two volumes of poems, which were republished after his death with additions by his friend Karl Reinhard: '*Bürger's Gedichte*,' 2 vols. 8vo. Göttingen, 1796. A third volume was published by Reinhard in 1797, containing several specimens of translations from the *Iliad*, both in iambics and hexameter verse, with dissertations by the author. Bürger's ballads and romances have long been popular in Germany. His '*Leonora*' has been translated into English: '*Bürger's Leonora*,' by Wm. Robt. Spencer, fol. London, 1796. A few more translations from Bürger are contained in the '*Specimens of the German lyric poets*,' Lond. 1823, with a short biographical notice of the author. Bürger's romances are grounded upon local traditions and legends, and he makes great use of the feeling of terror produced by apparitions and other supernatural agency, always directed however to the object of moral retribution. His '*Wilde Jäger*,' or '*Pierce Huntsman*,' is a good specimen of this sort. Bürger's amatory poems are soft and pleasing, and unexceptionable on the score of morality. His language is easy and clear. He is altogether one of the first German lyric poets, although Schiller has judged him rather severely. A. W. Schlegel says of Bürger, that 'he is a poet of an imagination more original than comprehensive, of feelings more honest and candid than tender or delicate, is more successful in the execution than in the invention of his subjects, and more at home in romance than in the loftier regions of the lyric muse.' (Mad. de Staël, *L'Allemagne*, Schlegel; and the *Biographical Notice* above mentioned.)

BÜRGER, a German appellation, denoting a citizen or freeman of a municipal town. It is derived from '*burg*' (Borough), and is more particularly used in speaking of those inhabitants of a free town in Germany or Switzerland who have the right of voting at the election of members for the legislative council. The right of burghership, whether in a free town or in a mere municipal town of the above-mentioned countries, is, or was until very lately, acquired either by inheritance or by purchase. The French word '*bourgeois*' was originally synonymous with '*bürger*,' but it now means simply any native inhabitant of a town, without necessarily implying the possession of municipal rights, which in France have been much restricted by the encroachments of the central government, and are become of much less importance than in Germany.

BURGESS. [Boroughs of England and Wales.]

BURGH CASTLE, an ancient Roman encampment, is situated on the borders of Suffolk, and on the east side of the river Waveney, near its confluence with the Yare. Its form is nearly a regular parallelogram, 612 ft. long by 400 ft. broad: the walls are about 14 ft. high and 9 ft. thick.

On the east side, the walls, which are furnished with circular watch-towers, are almost perfect, but those on the north and south sides are partly in ruins: the west wall, if there ever was one, has entirely disappeared. The site of the encampment is slightly elevated towards the west, and the interior is irregular, which may be accounted for on the

supposition that the small eminences are occasioned by the ruins of former edifices. The whole area of the inclosure was about 4 acres and three-quarters. The walls are of rubble masonry, faced with alternate courses of bricks and flints: and on the tops of the towers, which are attached to the walls, are holes 2 ft. in diameter and 2 ft. deep, supposed to have been intended for the insertion of temporary watch-towers probably of wood.

[Plan of Burgh Castle, the ancient Orianonoth, Suffolk.]

- A, B, Raised mounds.
- C, Ground fills at this point.
- D, Porta Decumana.
- E, Walls in a ruined state.

On the east side the four circular towers are 14 ft. in diameter. Two of them are placed at the angles, where the walls are rounded, and two at equal distances from the angles; an opening has been left in the centre of the wall, which is considered by Mr. King to be the Porta Decumana, but by Mr. Ives the Porta Prætoria. The north and south sides are also defended by towers of rubble masonry. The foundation on which the Romans built these walls was a thick bed of chalk lime, well rammed down, and the whole covered with a layer of earth and sand, to harden the mass and exclude the water: this was covered with two inch oak plank placed transversely on the foundation, and over this was a bed of coarse mortar, on which was roughly spread the first layer of stones. The mortar appears to be composed of lime and coarse sand, unsifted, mixed with gravel and small pebbles or shingle. Mr. Ives thinks they used hot grouting, which will account for the tenacity of the mortar. The bricks at Burgh Castle are of a fine red colour and a very close texture—they are one foot and a half long, one foot broad, and one inch and a half thick.

The west side of this station was probably defended in ancient times by the sea, which is now however at some distance; the river Waveney being at present the western boundary. The fact of the sea having receded is proved by an old map of *Gariensis Ostium*, as it is supposed to have appeared in the year 1000. A copy of this map was made from the ancient plan in the time of Elizabeth, and is preserved in the archives of the corporation of Yarmouth. In confirmation of this circumstance there have been discovered at Burgh Castle, parts of anchors, rings, and other large pieces of iron.

Gariennum may have been founded by Ostorius Scapula, who subjected the Iceni in the reign of the Emperor Claudius. Both Camden and Mr. Ives place the prætorium in the S.W. corner of the station, but King, in his '*Munimenta*' (vol. ii., p. 53), considers it to be an additional work by the Saxons or Normans, similar to the Saxon keep at the S.E. corner of the Castrum at Pevensey in Sussex, and accordingly he places the prætorium indefinitely on the west. Camden and Ives both assert that the towers were added after the walls. There are some remains of a fosse on the south side.

Mr. King calculates that Burgh Castle was capable of containing one whole cohort and a half with their allies (ii., p. 116). Several Roman coins and other antiquities have been discovered here: the oldest is a copper coin of Domitian. A coin of Gratian, of silver, and some coins of Constantine have also been found: some silver and gold coins were given by J. Smith, Esq., the former possessor of

the place, to Dr. Moore, bishop of Norwich. Besides these coins found both in the inclosure and in a field contiguous to the castle, there have been found coarse urns, a silver spoon with a pointed handle, bones of cattle, coals, burnt wheat, rings, keys, fibulae (*buckles*), and a spear-head. This field is supposed to have been the burial-place.

The earliest modern notice of Burgh Castle is in the reign of Sigebert, 636, when Porseus, an Irish monk, having collected a company of religious persons, settled at Burgh Castle, then called, according to Bede, Cnobersburgh. In the time of Edward the Confessor, bishop Stigand held Cnobersburgh by socage. The castle was afterwards held by Robert de Burgh, from whom the present name is probably derived. It was surrendered in the reign of Henry III., who, in the 20th year of his reign, gave it to the monastery of Bromholde in the county of Norfolk. It afterwards came into the possession of laymen. For some curious particulars concerning the manor, see Ives' 'Gariannonum,' from which much of the above information is derived; Camden's 'Britannia,' and King's 'Monimenta Antiqua': also a plan and view in the British Museum. The plan and view in this article were made by W. B. Clarke, architect, in 1844.

View of the perfect side of Gariannonum with two of the towers and the Porta Decuriana.

BURGLARY. The derivation of this word is quite uncertain. By some writers it is supposed to have been introduced by the Saxons, and to be compounded of *burg*, a castle or house, and *larron* or *latro*, a thief. But Spelman conceives that the term was introduced into the criminal law of England from Normandy, and says that he finds no traces of it among the Saxons. (Spelman's *Glossary*, tit. *Burglaria*, and *Humesecken*.) The offence of burglary at common law is defined to be 'a breaking and entering the dwelling house of another in the night, with intent to commit some felony within the same, whether such felonious intent be executed or not.' By the statute 7 and 8 Geo. IV. c. 29, sect. 11, entering the dwelling-house of another with intent to commit a felony; or being in such dwelling-house and committing a felony, or in either case breaking out of the house in the night-time, was declared to constitute a burglary, and to be punishable with death. The leading characteristics of this offence are, 1st, that it must be committed in the night-time, that is, at a time when people are presumed to be sleeping; and therefore it is said in the books, that if there be a sufficient dawning of 'daylight or crepusculum, either begun or left, enough to see a man's face withal,' when the offence is committed, it will not be burglary. The reason of the rule is that the offence, to be complete, must be committed in the dead of night, and it follows from this reason that a burglary may be committed in the brightest moonlight.

2. There must be a breaking and entering of the house; which parts of the offence however are completed by the robber even breaking a pane of glass and putting in his hand with a felonious intention.

3. The house broken must be the dwelling-house, or, as it is called, the 'mansion-house' of the person injured. By this is meant that it must be a permanent dwelling, and not a booth or tent; and also that it must be the place of the actual and personal residence of man, and not a mere stable, barn, or out-house: unless such buildings are con-

nected with the dwelling-house. Upon this part of the subject a great variety of nice distinctions have arisen, for which we refer to **HOUSE-BREAKING**.

An indictment for burglary is rarely presented or tried at the present day, unless in very aggravated cases where capital punishment is probable, as several recent statutes have rendered the prosecution for house-breaking a simpler and equally efficient proceeding.

BURGOMASTER, BÜRGERMEISTER, is the title of the chief magistrate of a municipal town, answering to the English mayor. In the German free towns the *bürgermeister* is the president of the executive council of the republic. This is also the case at Zürich, Basel, Schaffhausen, and some other Swiss cantons; while at Bern, Fribourg, and Luzern, the corresponding magistrate is called *schultheiss* (in French 'avoyer'), and in the rest of the cantons *landammann*; which last is not a German but a Swiss term.

BURGOS has been supposed to be of Roman origin, but the fact is, that, after the most careful research, it is hardly possible to trace the existence of Burgos farther back than the reign of Alphonso I. of Asturias and Leon, who colonized as it were part of that very territory, which then began to change its former name of *Bardulia*, or *Vardullia*, for the modern one of *Castile*. Some of the new settlers having constructed a few habitations on the fine banks of the Arlanza and Arlanzon, formed six boroughs or hamlets, vestiges of which are still recognizable at the hermitages of Santa Cruz, San Juan Bautista, and Santa Coloma. These six boroughs or *burgos* (a name, according to Andreas Braccio, introduced into Italy and Spain by their northern invaders) were incorporated into a single or rather collective borough, by Diego Porcellos, whom Alphonso III. directed, in the year 884, to erect a castle on a commanding hill on the right bank of the Arlanzon. As in process of time the Moors receded farther and farther to the S. of Burgos, the higher parts of the town were abandoned for a lower and more comfortable situation towards the plain; so that the *calle alta*, the street which is now the highest, was formerly the lowest of the city, and probably the best, since in it the native leading patriots, Fernan Gonzalez, and the Cid, had once their palaces. A triumphal arch in honour of the former hero, and the mausoleum of the second, now mark the spot before covered with those structures.

As long as Burgos was animated by the presence of its sovereign alternately with Toledo, commerce flourished, industry was excited, and manufactures were multiplied. Its crowded fairs displayed wealth and prosperity; and it was the entrepôt of all the trade that was carried on from the interior of Spain with the several ports on the Bay of Biscay. It was also the residence of an important factory of many foreign merchants; and the once famous Segovian wool cloth was transmitted from this city to every quarter of Europe. But when Charles V. transported the seat of royalty, in the beginning of the 16th century, to Madrid, its prosperity began rapidly to decline, and in three generations it was so impoverished and depopulated, that its former 40,000 inhabitants and upwards dwindled to 9000 and less, leaving to Burgos the bare honour, which it still retains, of being the capital of Old Castile, and of the province (*partido*) and archbishopric of its own name.

Burgos retains a certain air of antiquity and departed glory. It is a large but irregular city, forming a sort of semicircle, partly surrounded by ancient walls. Close to them flows the Arlanzon, which is crossed by three free-stone bridges leading to the suburbs, called *Pega*. Burgos has a beautiful promenade, enlivened by the intermixture of delightful gardens, constantly refreshed with fountains of water. Another promenade for the winter and a general burial ground (*campo santo*) have been recently added to the ornaments and conveniences of the city. Some of the streets are narrow and crooked, but others are much better, especially that leading to the cathedral. Of its numerous squares the only one deserving of notice stands in the middle of the city, and is surrounded by a piazza supported by lofty pillars, over which are some tolerably handsome houses. In the centre of this square is the statue of Charles III. There are also other statues which ornament the public places, particularly some of the fountains, with which Burgos is well supplied. The principal approach to the city is by the gate of Santa Maria, which opens on one of the bridges above-mentioned. This gate was built to commemorate the founders of the Castilian

monarchy and the illustrious men who contributed to its honour and aggrandizement, with whose statues it is also adorned. Among these are Fernan Gonzalez, Charles V., the Cid, and Diego Porcelos. The best public buildings are the hôtel de ville, the palace of Velasco, and the triumphal arch already mentioned of Fernan Gonzalez, first Count of Castile. The Cathedral, a very fine and well-preserved specimen of Gothic architecture, was commenced in 1221 by Ferdinand III., whom the Spaniards call St. Ferdinand, but was not finished till some centuries after. This church is embellished with columns, statues, and other ornaments of exquisite taste, especially at the entrances called *del Perdon*, *Pellejeria*, and *Apostoles*. It has in front two steeples, with magnificent worked spires; and the octagonal chapel called *del Condestable* is the finest part of its interior.

The climate of Burgos is damp, and one of the coldest in Spain. The manufactures are woollen cloths, stockings, baize, blankets, hats, and leather. Burgos has also two washing establishments (*lavaderos*) for wool, and most of that which is exported from Spain passes through it. The surrounding country is very beautiful. The famous monastery of las Huelgas stands at a quarter of a league, and that of Miraflores at half a league S.E. of Burgos, which is 47 leagues or 112 m. N. of Madrid. It is in 42° 20' 59" N. lat., 0° 0' 10" W. long. of Madrid, which shows how conveniently the northern road from Madrid to France passes through Burgos. (Müñano; Laborle, *Voyage Pittoresque d'Espagne*; *Voyage de España* de Don Antonio Ponz, tom. xii. p. 19, &c.)

BURGOYNE, JOHN, supposed to be a natural son of Lord Bingley, but concerning whose youthful history we are without information, was appointed Lieut.-Col. Commandant of the 16th light dragoons in August, 1759. After serving at Belle Isle in 1761, he joined the Portuguese army under command of the Count De la Lippe in the following year, and greatly distinguished himself by surprising and capturing the town of Alcantara. Before his return to England he was promoted to the rank of colonel. In 1761 he was returned member of parliament for the borough of Midhurst, and for that of Preston in 1768. A presumed political connexion with the Duke of Grafton exposed him to the invective of Junius, by whom he was treated with great severity. He partook largely in the debates respecting the Falkland Islands in 1771, and in the following year he directed his attention to the abuses supposed to exist in the government of the East Indies. While serving as a subaltern at Preston he had secretly married Lady Charlotte, daughter of the Earl of Derby, with whom, after a time, the offending couple obtained reconciliation. This connexion first led him to write for the stage. His earliest dramatic piece, 'The Maid of the Oaks,' was written for a fête champêtre given at his father-in-law's seat (the Oaks), in June, 1774, by the Earl of Derby, in honour of the marriage of his eldest son, Lord Stanley, with Lady Betty, a daughter of the Duke of Hamilton. Lady Charlotte Burgoyne died at Kensington palace without issue, June 3th, 1776, during which year and that preceding it Burgoyne served in North America. In the summer of 1777 he was appointed to the command of a large force ordered to penetrate from Albany on the Hudson river to Canada, by the lakes. His numbers on paper were 8000 regulars, 2000 Canadians, and 1000 Indians; but of these there were never really assembled more than 7000 regulars, 150 Canadians, and 400 savages. After some success in the early part of his expedition, and the capture of Ticonderoga, he became greatly straitened for provisions, and more than one of his detachments were cut off. Having crossed the Hudson he encamped at Saratoga, about 30 m. N. of Albany. Here, in October, he was surrounded by 18,000 Americans, under Generals Arnold and Gates, who, perceiving the necessity to which their enemy was reduced, prudently declined battle, trusting to wear him out. Thus disastrously circumstanced, he opened a convention with General Gates, in which the American commander at first asserted that the retreat of the British was cut off, and proposed that they should ground their arms within their own encampments. He was answered with spirit to the first statement—that 'Lieut.-Gen. Burgoyne's army, however reduced, will never admit that their retreat is cut off while they have arms in their hands; and to the second demand—'This article is inadmissible in any extremity. Sooner than this army will consent to ground their arms in their encampment,

they will rush on the enemy, determined to take no quarter. And again, in similar language,—'If General Gates does not mean to recede from the 6th article, the treaty ends at once. The army will, to a man, proceed to any act of desperation rather than submit to that article.'

It was finally settled that the British troops should march out of the camp with all the honours of war, and should be sent to Europe on condition of not serving in America during existing hostilities. The ministry in England received the news of this convention with profound indignation, since it was chiefly owing to it that France acknowledged the independence of the United States; and the press was vigorously employed to shift the blame from the cabinet upon General Burgoyne. Both an audience with the king and a court-martial were refused; and when he defended himself in the house of commons, an attempt was made to exclude him from that assembly, under pretence that, as a prisoner of war, he had no right either to speak or to vote; but the speaker having been appealed to decided in his favour. On that occasion he voluntarily resigned all his appointments. At a subsequent period, when he was allowed to produce evidence before a committee which had been appointed to inquire into the conduct of Sir William Howe, the testimony advanced was highly in favour of his bravery and military knowledge.

On the change of ministry at the close of the American war, he was appointed Commander-in-chief in Ireland, the last of his professional employments; and he appears, on his resignation two years afterwards, to have devoted himself entirely to lighter literature. He contributed to the 'Rolliad,' the 'Ode to Dr. Prettymann,' and the 'Westminster Guide.' A comic opera, the 'Lord of the Manor,' had already appeared in 1780, and in 1786 he attempted a higher species of composition in the comedy of 'The Heiress.' Not long afterwards he adapted to the stage Sedaine's historical romance 'Richard Cœur de Lion.' His political career ended by his being appointed one of the managers for conducting the impeachment of Mr. Hastings. During the trial of Hastings, he moved and obtained the censure of the house upon Major Scott, for an attack on the conduct of the committee. He did not live till the conclusion of the trial, but was cut off by a sudden attack of the gout, on the 4th of June, 1792, and was buried privately in the cloisters of Westminster Abbey.

The dramatic and poetical works of Lieutenant-General Burgoyne were collected in two small volumes in 1808, and it is perhaps offering praise inadequate to his merits when we describe him as a very agreeable and clever writer. It would not be just to subject his lighter theatrical pieces to grave criticism, and it may be enough to say of them that after the lapse of about fourscore years, 'The Lord of the Manor' and 'Richard Cœur de Lion' still keep occasional possession of the stage; we know not indeed where to find eight lines of simpler or deeper pathos than the song 'Encompass'd in an angel's frame,' introduced into the former. Of 'The Heiress,' it is most probable that the author of 'The School for Scandal' was a diligent student, and that he borrowed and improved some of its situations and dialogue, a process by no means uncommon with Sheridan. The 'Hail to the Lyar' and 'The Westminster Guide' are inferior in point to scarcely any production in the witty volume of which they form a portion. (*Life* prefixed to his works.)

BURGUNDIANS, a people who settled in Gaul upon the downfall of the Roman empire. The origin of the name and of the people seems to be alike unknown. Plancher ('Hist. de Bourgogne') has very gravely stated and refuted the various conjectures on this head. A favourite supposition seems to have been that the Burgundians were descended from the Romans. They are mentioned by Pliny the elder, in his 'Hist. Nat.' lib. iv. c. 28, under the name of *Burgundiones*, and he numbers them among the branches of the great stock of the Vindili or Vandals; Ptolemy places these Vindili upon the lower Vistula. The Roman historians and orators give us some intimation of their disputes and wars with the Goths, the Alemanni, and other barbarous nations. In the reign of the Roman Emperor Probus they came into conflict with the Romans; Probus defeated them and their allies, who were of other branches of the Vandals. In the reign of Diocletian and Maximian they invaded Gaul in conjunction with the Alemanni; but their unwieldy host was destroyed by famine, pestilence, and the sword. In the time of the Emperor Valentinian I. they were at

variance with the Alemanni, who dwelt between the Upper Rhine and the Upper Danube, on account of some brine springs that were near the frontier of these two people, which shows that the Burgundians had moved from their seats on the Vistula to the country near the Rhine. Valentinian, desirous of humbling the Alemanni, formed an alliance with the Burgundians (Ammianus Marcellinus calls them *Burgundii*), who raised an army of 80,000 men, according to some writers, and advanced to the Rhine without experiencing any opposition from their terrified opponents. The emperor, having humbled his enemies, refused to perform his promises to his allies; and the Burgundians returned home highly disgusted with his breach of faith. In the reign of Honorius, about A.D. 406, or the beginning of 407, they invaded Gaul, like several other of the barbarous nations on the frontier, but it is doubted whether they acted conjointly. Shortly after this we find the Burgundians supporting Jovinus, who assumed the imperial purple in opposition to Honorius. The latter prince however made peace with them, and ceded to them part of Gaul, near the banks of the Rhine (or confirmed its previous cession by Jovinus), and from this cession arose the kingdom of Burgundy. About the same time the Burgundians embraced the Christian religion, at first under what is generally termed the orthodox form; afterwards they became Arians. Their kingdom afterwards increased so far as to comprehend that part of Gaul which was to the east of the Saône and Rhône (except the coast of Provence south of the Durance), Savoy, and a part of Switzerland.

Gundecarius was king of the Burgundians at the time of their settlement in Gaul. He was engaged in wars at a subsequent period with the Romans under Ætius (A.D. 435 or 436), and sustained a great overthrow from Attila (A.D. 450, or thereabout). Among his successors were Gundeuchus, and after Gundeuchus his four sons Gundobald, Godegisilus, Chilperic, and Godemar, who were said to be of Gothic extraction. Clotilda, or Clotildis, who married Clovis king of the Franks, was the daughter of Chilperic. Chilperic and Godemar dying, or being killed by Gundobald, according to Gregory of Tours (whose account is however to be received with great distrust), the remaining two brothers divided the kingdom between them, and fixed their residence, Gundobald at Lyons and Godegisilus at Geneva.

The character of Gundobald has been very unfavourably represented by Gregory of Tours; but perhaps Gregory's partiality to the Franks or his desire to win the favour of the Frankish kings influenced his judgment. Gundobald was in favour with the Romans. The emperor Olybrius bestowed upon him, A.D. 472, the title of patrician; and the usurper Glycerius rested on his support. His eloquence, his penetration, his quickness of invention, are celebrated by his panegyrists; and his tolerant spirit will be regarded in the present day as a subject of just applause. He was an Arian, perhaps the first Arian prince of his race, but he did not persecute the Catholics. Their bishops assembled without interruption, and their churches preserved their endowments. The king attended the discussions held by the advocates of the two parties on their points of difference, and kept up a correspondence with Avitus, the Catholic bishop of Vienne. He improved the laws of his kingdom, and even Gregory admits that his alterations were made with the view of rendering the condition of the old inhabitants of the country more tolerable, and of softening the barbarism of his Burgundians.

In the year 500 Gundobald was attacked by Clovis king of the Franks, whose ambition and military talents were raising the Franks to the supremacy of Gaul. Gundobald applied to his brother for aid against an enemy whom both had cause to fear. Godegisilus consequently joined him; but this treacherous brother was in secret alliance with the Franks, and in the battle which was fought near Dijon, he went over to them. Gundobald was in consequence defeated and fled to Avignon, where he fortified himself. Clovis pursued him to this city, and besieged him there; but meeting with a stout resistance than he expected, he concluded a peace with Gundobald, on condition of a tribute, which the latter afterwards refused to pay.

In this treaty Clovis neglected to secure the interests of Godegisilus, who had by this time overrun his brother's dominions and entered Vienne in triumph. Here Gundobald came upon him by surprise, besieged the city, and having taken it, caused Godegisilus, who had taken refuge in the church of the Arians, to be put to death. From this time Gundobald reigned over the whole kingdom of the Bur-

gundians. In the latter part of his reign he gave the Catholics reason to believe that he had embraced their views; but it is very questionable if ever he renounced Arianism; and it may be doubted if he designed anything more than to cajole the Catholic prelates, and to avert by their mediation the hostility of Clovis, who was a Catholic. Gundobald died A.D. 516.

Sigismund, the son and successor of Gundobald, had become a Catholic during his father's reign. Soon after his accession a council of bishops was held; and from the prelates who attended it, the extent of the Burgundian kingdom is inferred. Sigismund published, about A.D. 517, a collection of the Burgundian laws, which is still extant. These laws contain for the most part the original customs of the Germans, such as are found in the records of other German nations. Sigismund was twice married, and had children by each wife: by his first wife, who was daughter of Theodoric, king of the Ostrogoths of Italy, he had a son, Sigeric, and a daughter who was married to Theuderic, or Thierr, the Frankish king of Austrasia and son of Clovis. This son, upon an unjust suspicion instilled into him by the children of his second wife, he put to death A.D. 522. This act was the ruin of Sigismund. He lost his peace of mind, which he tried in vain to recover by a temporary retirement to the monastery of St. Maurice on the Rhône (which he had founded or re-established), and by other observances which the religion of the times dictated. Theodoric, king of the Ostrogoths, his surest support against the power and ambition of the Franks, was enraged at the murder of his grandson; the affections of Sigismund's own subjects were alienated; and the calamities which overtook him were regarded as judgments of heaven. In 523 Chlodomer, Clotaire, and Childebert, three of the sons of Clovis now dead, instigated by their mother Clotilda, attacked the Burgundian kingdom, to which they pretended to derive a claim by their mother. Sigismund was defeated and delivered up by his own subjects into the hands of Chlodomer, by whom he was carried to Orleans. Godomar, his brother, assumed the management of affairs, and recovered those cities which the Franks had taken. Chlodomer upon this ordered Sigismund, with his wife and some other persons, to be put to death. Godomar succeeded to the crown.

Chlodomer, having perpetrated this cruel deed, set out against the Burgundians, assisted by some troops sent to him by his brother Thierr, king of Austrasia, who had married the daughter of Sigismund, as already noticed; but he fell in battle near Vienne A.D. 524. This event retarded for a time the ruin of the Burgundian kingdom, which stood for about ten years longer. In 534 Childebert and Clotaire, sons of Clovis, and Theodebert, son and successor of Thierr king of Austrasia, made an entire conquest of it. Godomar was taken prisoner, and passed the rest of his days in captivity; and from this time the Burgundians disappear from history as an independent nation. They have indeed transmitted their name to later times, for one of the divisions of the Frankish monarchy was called from them Burgundy or Bourgogne, and the appellation has been inherited by one of the finest provinces of modern France. [BOURGOGNE.]

The Burgundians, like the other Germans, enjoyed a considerable share of political freedom. Their laws were enacted by the advice of the whole nation; and when those laws were promulgated by Sigismund, they retained their Germanic features: murder was however punished by death. They borrowed some things from the Roman laws, and the provincials who had been accustomed to those laws were allowed, at least in many instances, to retain them. When a Roman and a Burgundian happened to be at variance, a judge was appointed from each nation. The Burgundians are in their own laws distinguished by the designation *Barbari*.

The Burgundians retained their constitution under the dominion of the Franks; but they were obliged to pay tribute, and to serve them in their wars; and in the Frankish laws their subjection was made apparent by the inferior valuation of their lives. The death of a Burgundian might be atoned for by a payment of one hundred and sixty solidi, or snillings; that of a Frank for not less than two hundred. (Masco's *History of the Antient Germans*, translated by Lediard.)

BURGUNDY. [BOURGOGNE.]

BURIAL. [INTERMENT.]

BURIATES, THE, constitute one of the three great

divisions of nations into which the Mongols are divided; the two others are the Mongols themselves and the Eulith, or Calmucks. The Buriates inhabit the mountainous country including the Lake of Baikal on the W. and S., from the mouth of the river Bargosin on the E. side of the lake to the sources of the Lena on the W.; so that more than one-half of its shores are in their possession. They are also found to a considerable distance, perhaps upwards of 100 miles, from its shores.

In the form of their body they do not differ from the Mongols, and there is such a resemblance between the language spoken by these two nations that they are soon enabled to understand one another; yet the language of the Buriates is said to be much harsher in its pronunciation.

Those tribes of the Buriates which live on the N.W. shores of the Baikal lake are pagans, like the other nations of Siberia, and have adopted that kind of paganism which is called Shamanism. But the tribes which occupy the country to the S.E. of the lake have embraced the Buddhism of the Lamas. These Buriates are said to possess a literature which probably consists of theological and metaphysical writings.

A small number of the Buriates cultivate the ground, but by far the greater number live on the produce of their herds. They have numerous herds of horses, black cattle, and sheep; also a small number of camels, which in winter time are sewed up in blankets to defend them from the effects of the intense frost. Their chief wealth consists of horses, of which they eat the flesh and drink the milk.

The Buriates have made considerable progress in some of the arts of civilized life, especially in working iron and in tanning. They are well acquainted with the art of plating iron with silver, and they have a very simple method of doing it, which is described in the travels of Georgi. The art of tanning is only practised by the women, who evince in this branch of industry great ingenuity and much taste. The women also make all the woollen stuffs which are in use among them for dresses, blankets, covers for their dwellings, &c.

As they are obliged frequently to change their places of abode to procure pasture for their herds, they have different dwellings for summer and winter; but it seems that both kinds are convenient, and well adapted to the climate and their circumstances.

Many of the Buriates are rich. On the N.W. of the Baikal they seldom possess above 100 heads of animals of all kinds, and very rarely 500 or 1000; but those to the S.E. of the lake have sometimes many thousands.

According to the most recent information the number of all the Buriates subject to Russia who are able to bear arms amounts to 73,000, which would give a population of between 200,000 and 300,000 souls. Between Selensk and Nerzhinsk is the residence of the richest of their princes (called *taishas*), who, according to Cochrane, has about 23,000 subjects. (Georgi, Pallas, Cochrane.)

BURIGNY, JEAN LE'VEQUE DE, was born at Rheims in 1692. He went to Paris in 1713, and there applied himself strenuously to philological and historical studies. After several years he went to Holland, where he engaged with De St. Hyacinthe in the compilation of a literary journal called 'L'Europe savante,' which began to appear at La Hague, in January, 1718, and was continued till 1720. It is one of the best journals of that period, and contains many interesting articles on the literature and political history of the times. The collection of 'L'Europe savante' forms 12 vols. 12mo. About one half of the papers were written by Burigny. He published also 'Traité de l'autorité du Pape, dans lequel ses droits sont établis, et réduits à leurs justes bornes,' 4 vols. 12mo., 1720, a work of close reasoning, on a subject which is very intricate and has caused much controversy among Catholics. The author professes the principles of the Gallican church, and carries them to a very great length. The questions of the subordination of the pope to the councils,—of the fallibility of the pope and of the Roman church itself, and of the consequent right of the Catholic world, in such a contingency, to choose another pastor,—of the independence of the bishops, especially in matters of discipline, &c., are all discussed at length. The 'Histoire de la Philosophie Payenne,' 1721, was afterwards re-published at Paris under the title of 'Théologia Payenne; ou, sentimens des philosophes et des peuples payens les plus célèbres, sur Dieu, sur l'âme, et sur les devoirs de l'homme,' 2 vols. 12mo., Paris, 1754. This second edition is much superior to the first, and is con-

sidered by some as Burigny's best work. Brucker wrote some critical observations on the first edition, in his 'Otium Vindelicum,' Augsburg, 1731. Burigny having returned to Paris, was made a member of the Académie des Belles Lettres. His other works are, 'Histoire Générale de Sicile,' 2 vols. 4to., 1745, a work of great research, and one of the best on the subject.—'Traité de Porphyre touchant l'abstinence des viandes,' translated from the Greek of Porphyrius, with the Life of Plotinus, 12mo., 1747.—'Histoire des Révolutions de l'Empire de Constantinople depuis la fondation de cette Ville jusqu'à l'an 1453,' 3 vols. 8vo., 1750. The last book contains a retrospect of the various controversies, ruptures, and attempts at a reconciliation between the Greek church and that of Rome.—'La Vie de Grotius, avec l'Histoire de ses ouvrages et des négociations auxquelles il fut employé,' 2 vols. 12mo., 1752.—'La Vie d'Erasmus de Rotterdam,' 2 vols. 12mo., 1757, with many interesting particulars concerning the age of Erasmus. This work was translated into German by Reiche, with additions, 2 vols. 8vo., Halle, 1782.—'Vie de Bossuet,' 12mo., 1761.—'Vie du Cardinal du Perron,' 1768. These two last biographies are considered much inferior to the two preceding.—'Lettre sur les Démêlés de Voltaire avec M. de St. Hyacinthe,' 8vo., London, 1780. Burigny wrote also a number of dissertations, which are inserted in the 'Recueil des Mémoires de l'Académie des Belles Lettres.' His learning was very extensive, and his memory excellent, but his style is cold and rather diffuse. Burigny was amiable and unpretending; he lived entirely for study, and he was much surprised when, in his old age, he learned that Louis XVI. had bestowed on him a pension of 2000 francs. He died at Paris, in October, 1785, ninety-four years of age, having preserved his mental faculties to the last. Dacier wrote his eulogy for the Académie, of which he was a member.

BURIN. [GRAVER.]

BURKE, EDMUND, was born in Dublin on the 1st of January, 1730, O. S. His father, Richard Burke, or Bourke, a Protestant, and the son of a gentleman of landed property in the co. of Cork, was an attorney in large practice. His mother was a Miss Nagle, a Catholic lady. She was, it seems, great niece of Miss Ellen Nagle, who married Sylvanus Spenser, the eldest son of the poet. Edmund, whose Christian name may possibly have descended to him from the author of the 'Fairy Queen,' was the second of three sons, who, with a daughter, were all that grew up of a family of fourteen or fifteen children.

Mr. Prior, in his 'Life of Burke' (2d edit. vol. i. p. 7), in refuting the common calumny that Burke entered political life almost a penniless adventurer, has stated that he 'received from his family at various times a sum little short of 20,000*l.*,' a fact of which he was assured from unquestionable authority, and which was frequently mentioned by the late Dr. Lawrence to Burke's friends. But the proper authority for this fact is a document which appears to have been overlooked by all his biographers. We refer to the preface or introduction, extending to nearly seventy pages, prefixed by his executors to the celebrated 'Observations on the Conduct of the Minority in the Session of 1793,' when that pamphlet was first published in an authentic form immediately after his death. This interesting statement, which reviews the whole of Burke's history, and is full of curious and valuable matter, is not found in any of the collected editions of his works, having probably been withdrawn in order that it might be incorporated in the life of him long promised by his principal executor, Dr. King, the late bishop of Rochester, which however has never appeared. The passage relating to the matter now before us is as follows:—'He was daily vilified as an obscure and needy adventurer, yet he did not tell, what he had in his hands the means of substantiating, that he was sprung from a family antiently ennobled in several of its branches, and possessing an ample estate, which his grandfather had actually enjoyed; nor that he had himself sunk a handsome competency in his adherence to his party. Once, and but once, in debate, he was provoked to declare his private circumstances. . . . He said, that by the death of a brother whom he loved and lamented he had succeeded to upwards of 20,000*l.*; part of which he had spent, and the rest then remained to be spent in the independent support of his principles.' It may be observed that what is here affirmed about his grandfather having actually enjoyed the ancestral estate is contrary to the common statement. Mr. Prior's account is, that the estate in question, which was in the county of Limerick, had been

forfeited some time in the troubled period between 1641 and 1653; and that Edmund's great grandfather was the first of the family who removed to the county of Cork, where he had another property, which he left to his descendants. This last estate was of comparatively small value.

Young Burke, whose health in his childhood was very delicate, being sent to live with his grandfather in the county of Cork, was first put to school at the village of Castletown Roche, where he is supposed to have remained about five years. On his return to Dublin he was sent to a school in that city; but he was removed in May, 1741, along with his two brothers, to the classical academy at Ballitore in the county of Kildare, which had been established some years before by John Barcroft and Amos Strettel, two members of the Society of Friends, and has ever since subsisted under the direction of persons of that communion. When Burke was sent there, the institution enjoyed a very high reputation under the management of Abraham Shackleton, a Quaker of superior talents and learning, who had been brought over from Yorkshire to conduct it about fifteen years before. Here Burke remained for about three years, during which time he always considered that he had acquired the most valuable of his mental habits. With Richard Shackleton, the only son of his master, and afterwards his successor in the school, he preserved an intimate friendship to the end of his life.

On leaving Ballitore Burke proceeded in April, 1744, to Trinity College, Dublin, where he does not appear to have greatly distinguished himself; but on the 26th of May, 1746, he was elected a scholar of the house. He commenced A.B. the 23rd of February, 1748, and proceeded A.M. in 1751. Meantime, having been intended for the English bar, he had entered at the Middle Temple on the 23rd of April, 1747; and in the beginning of 1750 he left Dublin for London.

Of his legal studies nothing is known with certainty; but it is probable that the attractions of literature and politics soon withdrew him from all thoughts of the law as a profession. It is believed that he became a writer in the newspapers and periodical publications almost immediately on his arrival in London. About 1752 or 1753 he is said to have offered himself as a candidate for the professorship of logic in the university of Glasgow, and to have been unsuccessful; but the whole of this story is considered very doubtful, and the records of the university do not afford the means of settling the question, as it is not the practice in elections to register any names but those of the successful candidates.* About the year 1755 he had formed the design of going to America, where some place under government had been offered him in one of the provinces. This project however, which he seems to have entertained for upwards of two years, he finally gave up in consequence of the opposition of his father, whom he had already displeased by his abandonment of the bar.

His first separate literary work, so far as is known, appeared in 1756, in the form of an octavo pamphlet of 106 pages, entitled 'A Vindication of Natural Society, or a view of the miseries and evils arising to mankind from every species of artificial society, in a letter to Lord * * * * by a late noble writer.' This is—especially for a young man of twenty-six—in all respects a very remarkable production. In the first place, the imitation of the style and manner of Lord Bolingbroke, by whom the 'Vindication' affects to be written, is so skilfully managed that when it first appeared, without the preface explaining the design which now introduces it, even some persons eminent in the literary world—Lord Chesterfield and Bishop Warburton among others—are said to have taken it for a genuine production. But, without reference to its merit as an imitation, the style is throughout singularly flowing and brilliant: and indeed it would, we apprehend, be difficult to mention any piece among Lord Bolingbroke's compositions in which the same spirit and eloquence are so long sustained. The performance however is chiefly deserving of attention as indicating the peculiar direction that the mind of the author had already taken in speculating upon the subjects which he handles, and as proving how early there had been formed in it at least the germs of that philosophy of morals and of society which may be traced in all his writings and his subsequent public conduct. The following passage, containing the key to the purpose of the pamphlet, will be at once recognised by all who are familiar with his writings

on the French Revolution, as identical in spirit with the whole tenor of those his latest productions; and his various speeches on the American war are all marked and pervaded by the same cast of thought, which may be defined generally as a deep sense of the incompetency of the human mind when giving itself up to speculative ingenuity, and rejecting all light and guidance from the experience of past ages, and all regard for things actually established, to cope with the complex problem of re-arranging society; and, derived from these feelings, a vehement aversion to the introduction into the practice of statesmanship of any thing appertaining to what may be called the metaphysics of social philosophy:—'The editor is satisfied that a mind which has no restraint from a sense of its own weakness, of its subordinate rank in the creation, and of the extreme danger of letting the imagination loose upon some subjects, may very plausibly attack everything the most excellent and venerable; that it would not be difficult to criticise the creation itself; and that if we were to examine the divine fabrics by our ideas of reason and fitness, and to use the same method of attack by which some men have assailed revealed religion, we might, with as good colour, and with the same success, make the wisdom and power of God in his creation appear to many no better than foolishness.'

A few months after this pamphlet he published his 'Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful,' which however he is said to have begun when he was only nineteen. The leading doctrine propounded in this essay is, that the feeling of the *sublime* means the delight we experience whenever we have an idea of pain and danger, without being actually in such circumstances; and that the feeling of the *beautiful* means the delight that is excited in us by all such qualities in things as induce in us a sense of affection and tenderness or some other passion the most nearly resembling these, while we are yet altogether unaffected by the physical passion the object of which is the beauty of women. These views are illustrated by many ingenious and striking observations: but the spirit of the work on the whole is certainly rather critical than metaphysical. It was however very well received by the public, and immediately brought the author into much notice.

This year, Burke, having gone to Bath to re-establish his health after an attack of illness, and having there taken up his residence with his countryman and distant relation, Dr. Christopher Nugent, a physician, formed an attachment to that gentleman's daughter, and married her. Dr. Nugent was a Catholic, but his daughter had been brought up a Presbyterian by her mother, who is said to have been a very rigid one.

In April, 1757, Dodsley, who had been the publisher of the 'Inquiry into the Sublime and Beautiful,' brought out 'An Account of the European Settlements in America,' in 2 vols. 8vo., a performance of which, although it has not found a place in any collected edition of his works, there can be little doubt that Burke was the author. Indeed his receipt to Dodsley for the copy money, fifty guineas, was sold a few months ago by Evans at an auction of autographs. The work, although somewhat unequally written, is an animated and interesting sketch of American history up to the date of its publication; the general views are often ingenious and comprehensive, and the information is the result of very considerable reading. The fondness for the study of the subject of commerce, by which Burke was afterwards so much distinguished, is strongly displayed in this early production. 'My principal view,' he says in his preface, 'in treating of the several settlements, was to draw everything towards their trade, which is the point that concerns us the most materially;' and one of his remarks in the body of the work is, that whereas at the time when settlements in America were first formed by the Spaniards and Portuguese, 'the speculative knowledge of trade made no part of the study of the elevated or thinking part of mankind, now it may be justly reckoned amongst the liberal sciences, and it makes one of the most considerable branches of political knowledge.'

There is every reason to believe that Burke had already seriously determined to devote his whole strength to the attainment of political distinction. With such views he set to work vigorously to store his mind with the knowledge most necessary for an orator and statesman, making his labours as a writer for the press, as well as his private studies, subservient to this ambition. He had been for some

* Communication from Glasgow.

time employed on a history of England, and this year eight sheets of the work were printed by Dodsley in quarto. But although as much more was written as brings down the narrative to the end of the reign of John, the publication was for some reason or other given up. The whole has been printed from the author's papers since his death. He soon after engaged in a work which occupied much of his attention for many years, and which indeed he is understood to have in some degree superintended to the end of his life, the 'Annual Register,' the first volume of which, for the year 1758, was published by Dodsley in June of the following year. (ANNUAL REGISTER.) For the preparation of this work, which from the first was highly successful, Burke appears to have been paid by Dodsley at the rate of 100*l.* per volume.

He had now become very generally known in the literary circles of London, and also to many persons of political consequence. Among the latter was the popular Irish nobleman, the late Lord Charlemont, during a long life one of the most distinguished members of the Whig connexion in Ireland. His lordship introduced Burke in 1759 to Mr. William Gerard Hamilton, better remembered by the name of Single-Speech Hamilton. When Lord Halifax, who was Hamilton's patron, went over to Ireland as lord-lieutenant, in 1761, Hamilton accompanied him as chief secretary, and the latter offered the place of his private secretary to Burke. The offer was accepted, and Burke now returned to his native country, there to make his first entrance upon public life.

This connexion however did not last long. Burke's activity and the usefulness of his services to the government soon acquired for him much consideration; and in April, 1763, a pension of 300*l.* per annum on the Irish establishment was settled on him: but having been instrumental in procuring him this reward, Hamilton, whose nature was intensely selfish, appears to have conceived that he had thereby entitled himself to Burke's services and servility for life, as much as if he had paid him the money out of his own pocket. On discovering this, Burke immediately threw up the pension, after having enjoyed it only a year, and broke with his patron for ever.

When the Marquis of Rockingham was called to the head of affairs, on the breaking up of the administration of Mr. George Grenville, in July, 1765, Mr. Burke was, on the recommendation of several common friends, and especially, it is said, of Mr. Fitzherbert, member for Derby, appointed to the situation of private secretary to the new premier. He has himself, in his 'Appeal from the New to the Old Whigs' (written in July, 1791), given us the date of his appointment—the 17th of July, which was just a week after the nomination of the Marquis as First Lord of the Treasury. 'This July,' he says, speaking of himself in the third person, 'it will be twenty-six years since he became connected with a man whose memory will ever be precious to Englishmen of all parties, as long as the ideas of honour and virtue, public and private, are understood and cherished in this nation. That memory will be kept alive with particular veneration by all rational and honourable Whigs. Mr. Burke entered into a connexion with that party, through that man, at an age far from raw and immature; at those years when men are all they are ever likely to become; when he was in the prime and vigour of his life; when the powers of his understanding, according to their standard, were at the best; his memory exercised, his judgment formed, and his reading much fresher in the recollection, and much readier in the application, than now it is.' He was also, as soon as the houses re-assembled, brought into parliament as member for Wendover in Buckinghamshire, a borough belonging to Lord Verney. In the preface to the 'Observations on the Conduct of the Minority,' already referred to, it is said, 'He declined taking any salary for his employment under Lord Rockingham, as secretary to the First Lord of the Treasury, and at his own cost he obtained a seat in parliament.'

Subordinate as was his nominal post, Burke may be said to have become immediately the animating spirit and chief moving power of this administration. The very day he took his seat in the House of Commons, the 14th of January, 1766, he is stated to have taken part in the debate on the address of thanks, and to have been complimented on his appearance in very flattering terms by Mr. Pitt. No account of his speech however, and indeed no notice of its delivery,

is given in the common report of the debate; and this is the more remarkable, as that report (which was published at the time by itself in a pamphlet, pretended to have been printed at Paris) is understood to have been in part prepared by Lord Charlemont. But there is no doubt that Burke immediately became one of the most active and efficient combatants in the ministerial phalanx. Probably no man ever entered parliament so well trained and accomplished by previous acquirements and intellectual discipline. But the natural ascendancy of the man showed itself perhaps still more remarkably in the part he sustained in the out-of-doors consultations and movements of his party. The great question which the Rockingham administration was brought in to settle was that of the American Stamp Act; and the prudent and conciliatory measures by which the rising storm in the colonies was at this time allayed, are understood not only to have been originally suggested and planned by Burke, but to have been mainly indebted to his indefatigable activity, and zealous, persevering, and persuasive advocacy, for their final adoption by the various sections of the ministerial body.

When Lord Rockingham and his colleagues were dismissed on the 30th of July, 1766, Burke's pen was called into requisition to prepare such a manifesto for the public as was thought to be called for in the circumstances. This task he executed with much effect in a brief but pithy statement, under the title of 'A Short Account of a late Short Administration.'

'There are who remember,' he informs us in his 'Appeal' already quoted, 'that on the removal of the Whigs, in the year 1766, he was as free to choose another connexion as any man in the kingdom. To put himself out of the way of the negotiations which were then carrying on very eagerly, and through many channels, with the earl of Chatham, he went to Ireland very soon after the change of ministry, and did not return until the meeting of parliament. He was at that time free from anything which looked like an engagement. He was further free at the desire of his friends; for, the very day of his return, the marquis of Rockingham wished him to accept an employment under the new system. He believes he might have had such a situation; but again he cheerfully took his fate with his party.' It is understood that in the 'crossly-indented and whimsically dovetailed piece of joinery' which Lord Chatham was now endeavouring to put together, it was intimated to Burke that he might have the place of one of the Lords of Trade. It is also said that before the prorogation in July, 1767, an offer of a seat at the Treasury Board was made to him by the duke of Grafton, who, in the illness and disgust of Lord Chatham, had now become the head, or at least the podding part, of the crazy administration. But the temptation, which had allured several of the most distinguished of his former associates, was again resisted. Up to this time it is to be remembered that the Rockingham party, although they had refused as a body to ally themselves with the ministry, had not gone into opposition. They took the latter course however in the following session, which opened in November, 1767. The parliament was dissolved in March, 1768, when Burke was again returned for Wendover.

The following year appeared his first political pamphlet, under the title of 'Observations on a late State of the Nation,' being a reply to a publication entitled 'The Present State of the Nation,' which was understood to have been written either by Mr. George Grenville, or, under his eye, by Mr. Knox, who had formerly been his secretary. From the temporary interest of much of the matter in Burke's pamphlet, it is now probably little read; although it seems to have continued in demand for a good many years, if we may judge from a fifth edition of it published by Dodsley in 1782, which is now before us. But it is a remarkably able and vigorous performance, although presenting comparatively little of that splendour of imagination which distinguishes many of the author's subsequent writings. Here again we find strongly expressed the same aversion to abstract politics which we have already described as the prevailing spirit both of his earliest and latest speculations on such subjects. Speaking for instance of the state of the Americans before the attempt made to impose internal taxes upon them by the British parliament, he says, 'In the midst of that happy enjoyment, they never thought of actually settling the exact limits of a power [that of the mother country] which was necessary to their union, their safety, their equality, and even their liberty. Thus the two

very difficult points, superiority in the presiding state, and freedom in the subordinate, were on the whole sufficiently, that is practically, reconciled; without agitating those vexatious questions, which in truth rather belong to metaphysics than politics, and which can never be moved without shaking the foundations of the best governments that have ever been constituted by human wisdom.' This pamphlet has been sometimes referred to as curious, on account of a passage in which some extraordinary convulsion in France is predicted as an event to be hourly looked for, from the deranged state of the finances of that country, 'the effect of which,' it is added, 'on France, and even on all Europe, it is difficult to conjecture.' In his latest writings however Burke was accustomed to take a somewhat different view of the connection between the French Revolution and the previous derangement of the finances. For instance, in his first 'Letter on a Regicide Peace' (1796), he says, 'The financial difficulties were only pretexts and instruments, of those who accomplished the ruin of that monarchy. They were not the causes of it.' The production before us is perhaps more remarkable for the progress in advance of his age which it shows the author to have made in his views on the subject of commerce. In his 'Account of the European Settlements in America,' he speaks of the errors of former times, 'when what we call the balance of trade was far from being well understood.' In the present work there is a passage respecting this same balance of trade, in which the fallacy of the common doctrine is very strongly put. He is speaking of the Newfoundland trade: 'Examine,' he says, 'our imports from thence; it seems, upon this vulgar idea of exports and imports, to turn the balance against you. But . . . your import is your own food; as much your own as that you raise with your ploughs out of your own soil; and not your loss, but your gain; your riches, not your poverty. . . . To state the whole of the foreign imports as loss is exceedingly absurd. . . . Even where they are not subservient to our exports, they still add to our internal wealth, which consists in the stock of useful commodities, as much as in gold and silver.' 'These considerations,' he adds, 'have been but too much neglected by most who have speculated on this subject.' Adam Smith, when he became acquainted with Burke some years after this in London, declared that he was the only man he had met with who thought as he himself did on the chief topics of political economy, without previous communication.

The pamphlet on the state of the nation was followed in 1770 by the 'Thoughts on the Cause of the Present Discontents,' perhaps the most carefully finished and the most perfect, though not the most splendid, of all Burke's writings. In the preface to the 'Observations on the Conduct of the Minority,' it is asserted that this production was drawn up at the desire of the Rockingham party: that the materials of it were collected from various conversations with all the leading members of that connexion; and that before it was sent abroad into the world the particular and distinct approbation of each was obtained. In November, 1771, Burke was appointed to the situation of Agent to the State of New York, the emoluments of which amounted to nearly 700*l.* a year. In parliament he continued to take a prominent part in all discussions, and now undoubtedly filled a larger space in the public eye than any other member of the opposition. In the session of 1772-3, nearly the whole of which was occupied in the discussion of the affairs of the East India Company, he particularly distinguished himself. In the next session a greater subject brought him still more conspicuously forward—the state of affairs in America; now, it might be said, almost in actual insurrection. On the 19th of April, 1774, he delivered his great speech, afterwards published, on 'American Taxation,' on occasion of Mr. Rose Fuller's motion for the repeal of the tea duty. On the dissolution of parliament a few months after, he was returned by the interest of Lord Rockingham for the borough of Malton; but while he was in the act of returning thanks to his new constituents, a deputation arrived from Bristol to intimate to him that he had been nominated for that city, and to carry him thither without delay. By travelling day and night he arrived at Bristol on the 6th day of the poll, and immediately proceeded to the hustings and addressed the electors. After a hard contest of twenty-seven days he was returned on the 3rd of November. On the 22nd of March, 1776, on moving in the House of Commons a series of resolutions for conciliation with the American colonies, he delivered another

speech of great eloquence and power, which he also some time afterwards sent to the press. The affairs of Ireland, and especially the repeal or mitigation of the Catholic disabilities, likewise now engaged much of his attention, and were the subject of his zealous exertions both in and out of parliament. In April, 1779, he drew up an able defence of his conduct on the American question, in the form of a letter to the sheriffs of Bristol, which was immediately published. This was followed in April and May, 1778, by 'Two Letters to Gentlemen in the City of Bristol, on the Bills depending in Parliament relative to the Trade of Ireland,' another subject on which the liberal course he had pursued had given great offence to many of his constituents. On the 11th of February, 1780, he submitted in the House of Commons his celebrated plan for the regulation of the affairs of the household, the ordnance, the mint, the exchequer, the army, navy, and pension pay-offices, &c., in five bills. The admirable speech with which he introduced this plan was published, and is commonly known as his Speech on the Economical Reform. None of his other parliamentary exertions procured him so much public applause as this. Its merits however did not outweigh, in the estimation of the majority of the electors of Bristol, certain other parts of his conduct which had excited their deepest resentment, especially his support of the acts for opening the trade of Ireland, and his strenuous advocacy of the measures for relieving the Roman Catholics, which this year excited so terrible a popular ferment. The consequence was, that on the dissolution of the parliament which took place this summer, he found it advisable to decline again standing for Bristol. He presented himself however to his former constituents previous to the election in the beginning of September, and addressed them in a speech which has been published, and is one of the very best he ever delivered. He was now returned for Malton, for which borough he sat during the rest of his parliamentary life.

When Lord North and his colleagues were at last forced to resign in March, 1782, and the Rockingham party again came into power, Mr. Burke was made a privy-councillor, and appointed to the office of paymaster-general of the forces. He received the usual treatment of the highest abilities, when unsustained by any aristocratic connexion, in being excluded from the cabinet. The office of paymaster had long been the most lucrative in the state; but Burke immediately brought in a bill for its reform, by which its enormous profits were completely swept away. The annual saving to the public which his plan effected amounted to 47,000*l.*, of which not less than 25,000*l.* were the usual perquisites which all his predecessors had received. He also now carried through his other bills of economical reform, though the various interests affected by them in both houses were sufficiently powerful to mutilate them by the excision of some of their most important parts.

On the death of the marquis of Rockingham in July, and the appointment of Lord Shelburne to the head of the Treasury, Mr. Burke resigned, along with Mr. Fox and the other friends of Lord Rockingham. The success of the celebrated coalition with Lord North, however, brought him back to his former office on the formation of the duke of Portland's ministry in March, 1783. In this and the following session he took a leading part in the discussion of the affairs of India and the Company's government of that territory, a vast and intricate subject, which he had long studied, and which he was universally admitted to understand better than any other man in parliament. 'Early in his opposition to Lord North,' says the preface to the 'Observations on the Conduct of the Minority,' 'the ruling directors of the East India Company wishing to stop a popular cry, and to take from government the best plea for intermeddling in their affairs, proposed to send Mr. Burke, on his own terms, at the head of a commission to reform the abuses of the East. Some of the correspondence on this occasion is still extant. He resolved not to go, actually refused the appointment, and then, and not before, acquainted Lord Rockingham with his determination.' Two voluminous Reports, numbered the 9th and the 11th, from the select committee appointed in a previous session to inquire into the administration of justice in the provinces of Bengal, Bahar, and Orissa, were entirely prepared by him. The first, dated the 25th of June, 1783, occupies 262 pages in the octavo edition of his works; the second, which was laid before the House the same year, extends to 80 pages,

exclusive of a bulky appendix of documents. On the 1st of December, he delivered another powerful speech, which he soon after sent to the press, on the motion for the House resolving itself into a committee on Mr. Fox's India Bill. When this famous measure determined the fate of the administration about a fortnight afterwards, Mr. Burke was dismissed from office with the rest of his party. He never was again a member of the government.

For some years after this the affairs of India engaged his whole 'heart, and soul, and mind, and strength.' One of the noblest of his published speeches is that which he delivered on the 28th of February, 1785, in support of Mr. Fox's motion for papers relating to the debts of the nabob of Arcot. This was followed by what have been justly called his 'Herculean labours' in the prosecution of Mr. Hastings. On the 4th of April, 1786, he presented to the House the articles of charge against the ex-governor-general; they fill two volumes of the octavo edition of his works. On the 1st of June he opened the first charge. It was not till February, 1788, that the trial began in Westminster-hall, when the impeachment was opened by Mr. Burke, in a speech which lasted four days, and was throughout a wonderful display of impassioned eloquence, and of all the resources of his rich and gifted mind. On the 21st and 25th of April, and the 5th and 7th of May, 1789, he opened the sixth charge in another speech, or rather series of orations. On the 30th of April, 1791, he presented to the House of Commons an elaborate report, filling 200 printed octavo pages, on the whole parliamentary law of impeachments, in the name of a committee which had been appointed to inspect the lords' journals in relation to their proceedings on this trial. Finally, on the 28th of May, in the same year, he commenced his concluding address on the impeachment, which continued for nine days. All these speeches have been published since his death, from notes which he spent the leisure of the last years of his life in preparing, and which he enjoined his executors to give to the world. His labours in what he was accustomed to call 'the Indian Field,' were to the close of his existence regarded by Burke as those by which he had deserved best of his country. Even in 1796, after all his warfare against the French Revolution, he writes (in his 'Letter to a Noble Lord on the Attacks made on his Pension'), 'I did not come into parliament to con my lesson. I had earned my pension before I set my foot in St. Stephen's chapel. I was prepared and disciplined to this political warfare. The first session I sat in parliament I found it necessary to analyze the whole commercial, financial, constitutional, and foreign interests of Great Britain and its empire. . . . Then, in the vigour of my manhood, my constitution sunk under my labour. . . .

. . . But in truth these services I am called to account for are not those on which I value myself the most. If I were to call for a reward (which I have never done), it should be for those in which, for fourteen years without intermission, I showed the most industry and had the least success, I mean in the affairs of India: they are those on which I value myself the most; most for the importance, most for the labour, most for the judgment, most for constancy and perseverance in the pursuit. Others may value them most for the *intention*. In that surely they are not mistaken.'

But while he was yet in the midst of his exertions in this department, another great subject suddenly called him off, which was destined to make the closing years of his life the most memorable and interesting portion of his political course. We have already had occasion to notice how early he had begun to keep an expecting eye upon the affairs of France. In a visit which he had paid to Paris not long before the accession of Louis XVI., 'he was courted and caressed,' says the Preface to the 'Observations on the Conduct of the Minority,' as a man of eminence by the literary cabal which was then preparing the way for the overthrow of altars and thrones. They daily beset him, and communicated to him enough to let a mind so observant as his into all their secrets. From that time he always dated those impressions, which made him foresee, in their first rudiments, the hideous consequences of the doctrines propagated, and the measures pursued, by the pretended National Assembly of France. Not long after his return from Paris, he took occasion, in the House of Commons, to testify those impressions. In a speech, of which no satisfactory report was ever given, but which was taken in short-hand, and of which a copy remains corrected by himself, he pointed out

the conspiracy of atheism to the watchful jealousy of governments. . . . With a mind thus long before prepared, he could not be slow in forming his notions of the French Revolution. Nevertheless he sought information from every quarter, as if the subject had been wholly new to him. He desired all persons of his acquaintance who were going to Paris (and curiosity attracted many) to bring him whatever they could collect of the greatest circulation, both on the one side and the other. He had also many correspondents, not only among the English and Americans residing there, but also among the natives, to whom, as well as to other foreigners, he had always done the honours of his country, as far as his means would permit him, with liberal hospitality. Among others, he received letters, endeavouring to trick out the events of the Revolution in the most gaudy colouring, from Mr. Paine, Mr. Christie, and Baron Cloots, afterwards better known by the name of Anacharsis. It was in answer to a letter of this kind from a French gentleman that he wrote his celebrated *Reflections*.

The 'Reflections on the Revolution in France' were published in the beginning of November, 1790. No political work probably was ever read with such avidity on its appearance, or produced so great an effect on the public mind. We have before us the sixth edition, printed before the end of the year. It is said that above 30,000 copies were sold before the first demand was satisfied.

It is stated in the preface to the 'Observations on the Conduct of the Minority,' that, on the publication of the work, 'Mr. Burke had the satisfaction of receiving explicit testimonies of concurrence and applause from the principal members of the party with whom he had begun his political career.' The opinions he had expressed, however, eventually led, as is well known, to a complete separation between himself and Mr. Fox, the then acknowledged leader of the Whigs in the House of Commons. The fullest and most minute account of the whole affair that has been published is that given in the Annual Register for 1791. To this narrative, none of the statements contained in which have ever, as far as we are aware, been contradicted, may be added the Preface to the 'Observations on the Conduct of the Minority,' to which we have so often had occasion to refer. The final contention in the House of Commons took place on the 6th of May, 1791. 'The scene altogether,' as the writers of the 'Preface' observe, 'was of the most afflicting kind.'

In the following July, Burke published an elaborate defence of the whole course of his political life, under the title of 'An Appeal from the New to the Old Whigs.' In this spirited vindication, he addresses himself especially to the attacks to which he had been subjected on the ground of the alleged inconsistency of his recent doctrines with those he had formerly maintained. 'This,' he observes, 'is the great gist of the charge against him. It is not so much that he is wrong in his book, (that however is alleged also,) as that he has therein belied his whole life. I believe, if he could venture to value himself upon any thing, it is on the virtue of consistency that he would value himself the most. Strip him of this, and you leave him naked indeed.'

We may safely venture to affirm that no person familiar with the whole series of Mr. Burke's writings can demur to the substantial soundness of the claim which he here puts forth. The soundness of his political doctrines themselves is another question: but, right or wrong, there are certainly none inculcated in his writings subsequent to the French Revolution which can fairly be said to be contradictory to those which he had maintained up to that event. His principles were altogether averse to a purely democratic constitution of government from the first. He always indeed denied that he was a man of aristocratic inclinations, meaning by that one who favoured the aristocratic more than the popular element in the constitution; but he no more for all that ever professed any wish wholly to extinguish the former element than the latter. Thus in his speech on the repeal of the Marriage Act, in June, 1781, he said, 'I am accused, I am told, abroad of being a man of aristocratic principles. If by aristocracy they mean the peers, I have no vulgar admiration, nor vulgar antipathy towards them; I hold their order in cold and decent respect. I hold them to be of an absolute necessity in the constitution; but I think they are only good when kept within their proper bounds.' And the work in which he may be said to have first made the profession of his political faith, his 'Thoughts on the Cause of the present Discontents,' is certainly any thing rather than a profession of democratic opinions. 'The

clear object of the whole,' as is observed in the preface to the 'Observations on the Conduct of the Minority,' 'is to recommend, as the best practical government for this country, an open aristocracy of rank, property, virtue, and talents, acting in concert together, on a known and avowed system of opinions agreeable to the existing constitution of the kingdom, acquiring by their principles and conduct the public confidence of the people, and, in all those titles, claiming the public confidence of the sovereign. None of his writings on the French Revolution were ever pursued with a more violent cry than was that pamphlet, by the republicans of the day.'

The only respect in which his latest writings really differ from those of earlier date is, that they evince a more excited sense of the dangers of popular delusion and passion, and urge with much greater earnestness the importance of those restraining institutions, which the author conceives, and always did conceive, to be necessary for the stability of governments and the conservation of society. But this is nothing more than the change of topic that is natural to a new occasion. It is sufficiently accounted for and justified by what he says himself in the last sentence of the 'Reflections,' where he describes his book as containing the opinions of 'one who wishes to preserve consistency by varying his means to secure the unity of his end; and, when the equipoise of the vessel in which he sails may be endangered by overloading it upon one side, is desirous of carrying the small weight of his reasons to that which may preserve its equipoise.'

The position in which Mr. Burke was now placed had separated him in fact, though not yet altogether in form, from the political party with which he had hitherto acted. It is known however that long after this time he still continued to urge a union between the ministers and the opposition, including Mr. Fox. In February, 1793, the war with France, which he had for some years predicted as inevitable, actually broke out. About the same time the first avowed breach took place in the Whig Club, by the formal secession of Mr. Burke, Mr. Windham, and other members, to the number of forty-five in all, on the occasion of a resolution passed by the majority of the club, which was construed as a declaration on the side of Mr. Fox, in the quarrel between Mr. Burke and him.

Mr. Burke meanwhile continued his exertions both with his pen and in parliament with as much vigour as ever. The 'Appeal' had been followed in December of the same year by a paper of considerable length, entitled 'Thoughts on French Affairs,' which however was not published till after his death. A letter which he wrote about the same time to the Empress of Russia, in acknowledgment of a communication through the Comte de Woronzow of her Majesty's thanks for his book on the French Revolution, is printed among his works. But, according to the Preface to the 'Observations on the Conduct of the Minority,' it was never sent, having been suppressed by the advice of ministers, to whom it was shown, 'in consequence of some doubts which they entertained—"just doubts," it is added, "as subsequent events have shown." He also wrote, among other shorter pieces, in January, 1792, the first Letter to Sir Hercules Langrishe on the Catholic Disabilities; in November of the same year a paper entitled 'Hints for Consideration on the present State of Affairs;' in the beginning of 1793 a Letter on the subject of the Popery Laws, addressed to his son, Mr. Richard Burke, who had lately been appointed agent for the Irish Catholics; in October, 1793, his 'Remarks on the Policy of the Allies with respect to France;' and soon after, a Prefatory Discourse to his relation Mr. William Burke's Translation of M. Brissot's Address to his Constituents.

He was now however anxious to retire from public life; and an arrangement having been made for his son to succeed him in the representation of Malton, he only remained in parliament to conclude the prosecution of Mr. Hastings. Accordingly, the last day on which he appeared in the House of Commons was the 20th of June, 1794, when the thanks of the house were voted to the managers of the impeachment for their faithful discharge of the trust reposed in them. Mr. R. Burke, within a few days after his election for Malton, was taken ill, and died on the 2nd of August, at the age of thirty-six. From this severe blow his father never recovered.

The division in the Whig party had been in the mean time extending itself; and Mr. Burke's friends, the Duke of Portland and Earl Fitzwilliam, who had not thought

proper to take part in the first secession, now not only left their old associates, but formally joined the ministry. Immediately after the close of the session of parliament in July, these two noblemen, with Lord Spencer and Mr. Windham, took office in the government. These arrangements are understood to have been brought about principally through the interposition of Mr. Burke. In October, 1795, he received a pension of 1200*l.* per annum on the civil list, and soon after another of 2500*l.* on the four-and-a-half per cent. fund. These grants are said to have originated in the express wish of the king.

An attack made upon him in the House of Lords on the ground of his pension, by the Duke of Bedford and the Earl of Lauderdale, drew from him, early in 1796, his celebrated 'Letter to a Noble Lord' (Earl Fitzwilliam), which was perhaps more generally read at the time, and has continued to be to a greater extent popularly known since, than anything else he ever wrote, with the exception of the 'Reflections on the French Revolution.'

His publisher on this occasion was I. Owen, of No. 168, Piccadilly, who appears to have been recommended to him by Mr. Windham. After some months, application being made to Owen for an account of the profits, he asserted that he had received the MS. as a present from the author; and rather than go to law with him, Mr. Burke chose to allow him to keep what he had got. Before this, however, Owen had obtained the MS. of another work from Burke, entitled 'Two Letters addressed to a Member of the present Parliament on the Proposals for Peace with the Regicide Directory of France.' This MS. he now refused to deliver up; and had the impudence to publish it in defiance of the author, with an Advertisement in vindication of his conduct. Meanwhile the work had been transferred by the author to Messrs. Rivington, of St. Paul's Church-yard, and was brought out by them in a correct form. In the concluding paragraph of the genuine edition, Burke speaks of the two Letters, as well as part of another which was to follow, as having been written long before. The second of these two Letters, in particular, is very remarkable for the observations it contains on the manner in which the war had till then been, and long afterwards continued to be, conducted; and for the confident tone in which it is announced that no success could be hoped for until that plan should be changed. The allies, it is observed, had adopted 'a plan of war, against the success of which there was something little short of mathematical demonstration. They refused to take any step which might strike at the heart of affairs. They seemed unwilling to wound the enemy in any vital part. . . . They always kept on the circumference; and the wider and remoter the circle was, the more eagerly they chose it as their sphere of action in this centrifugal war.' A third of the 'Letters on a Regicide Peace' was on its way through the press when Mr. Burke died. A fourth, addressed to Lord Fitzwilliam, which had been written before the three others, but never finished, was published after his death.

Early in 1797, Owen, the publisher, announced 'A Letter from the Right Honourable Edmund Burke to his Grace the Duke of Portland, on the Conduct of the Minority in Parliament; containing Fifty-four Articles of Impeachment against the Right Honourable C. J. Fox; from the Original Copy in the possession of the Noble Duke.' The publication immediately appeared, professing to be 'printed for the Editor,' and sold by Owen. There is no introductory notice, and the whole makes a pamphlet of 94 pages. This paper had in fact been sent to the press by Swift, a person whom Burke had taken into his service from motives of charity, and had confidentially employed to transcribe the only fair copy he ever had taken of it. It had been prepared in the early part of the year 1793, and communicated only to the Duke of Portland and to Earl Fitzwilliam, before they had seceded from the Whig Club. In a Letter, dated September 29th, 1793, which was sent along with it to the former, the writer says, 'I now make it my humble request to your Grace that you will not give any sort of answer to the paper I send, or to this letter, except barely to let me know that you have received them. I even wish that at present you may not read the paper which I transmit; look it up in the drawer of your library table; and when a day of compulsory reflection comes, then be pleased to turn to it.' Swift however had surreptitiously taken a copy for his own use. As soon as the publication appeared an injunction was obtained to stop its sale; but it was not-

withstanding reprinted immediately both in Scotland and Ireland, and about 3000 copies of it are supposed to have thus got into circulation. Burke was at the time at Bath, and was considered to be on his death-bed. The appearance of the paper, especially under such a title, annoyed him greatly. 'I never,' he says, in a letter which he wrote to Dr. Lawrence at the moment, 'communicated that paper to any out of the very small circle of those private friends from whom I concealed nothing. But I beg you and my friends to be cautious how you let it be understood that I disclaim anything but the mere act and intention of publication. I do not retract any one of the sentiments contained in that memorial, which was, and is, my justification, addressed to the friends for whose use alone I intended it. Had I designed it for the public, I should have been more exact and full. It was written in a tone of indignation, in consequence of the resolutions of the Whig Club, which were directly pointed against myself and others, and occasioned our secession from that club, which is the last act of my life that I shall under any circumstances repent. Many temperaments and explanations there would have been, if ever I had a notion that it should meet the public eye.'

In the end of May Mr. Burke quitted Bath for his house at Beaconsfield, in Buckinghamshire, where he died on the 9th of July. A correct edition of the paper which Owen had printed was now published by his executors, under the title of 'Two Letters on the Conduct of Our Domestic Parties with regard to French Politics, including Observations on the Conduct of the Minority in the Session of 1793.' The Letters were introduced by the important Preface to which we have so frequently referred. The 'Observations' are what had previously been published under the title of the 'Fifty-four Articles of Impeachment,' &c. The other paper is a 'Letter to William Elliott, Esq., occasioned by an account given in a Newspaper of the Speech made in the House of Lords by the Duke of Norfolk, in the Debate concerning Lord Fitzwilliam, in 1795.' His Grace, who had on the occasion referred to attacked Mr. Burke on the whole course of his recent politics, and more especially for the part he had taken in drawing off Lord Fitzwilliam from the old Whig connexion, is assaulted in turn with little mercy. The concluding portion of the Letter, which rises above personalities, is in a very high strain of eloquence.

We have mentioned in the course of this rapid sketch all the most important of Mr. Burke's writings. A collected edition of his works in 4to. was begun in 1792, and three volumes had been published before his death. Since then five more have been added, under the superintendence of his principal executor, the late Dr. Walter King, bishop of Rochester. The last appeared in 1827. A ninth volume was to contain the Life of the Author, by Dr. King; but whether or not the Life in question was ever written we are not aware. An 8vo. volume of Letters between Burke and his friend and executor Dr. Lawrence, was published in 1827. Burke's Speeches in the House of Commons, and in Westminster Hall, were published in 4 vols. 8vo. in 1816. An 8vo. volume of 'Memoirs' of Burke, 'containing many curious Anecdotes, both of a public and private nature, together with copies of several very interesting Letters from that Right Honourable Gentleman,' was announced by Owen at the end of his edition of the Letter to the Duke of Portland; but we do not know whether the book has ever appeared. There is a Life of Burke by Mr. Macormick, which we have not seen, but which we suppose to be the work described by Mr. Prior as 'a quarto volume of slander, dictated by the most envenomed party spirit, and probably meant at the moment to answer some party purpose.' Another, in two volumes 8vo., was published a short time after Burke's death, by Dr. Robert Bissot, the author of a History of the Reign of George III. By far the most accurate and complete Life of Burke however is that by James Prior, Esq., the second edition of which, in 2 vols. 8vo., appeared in 1826. There is also a very well drawn-up Sketch of Burke's Life prefixed to a handsome edition of his works, in 2 vols. crown 8vo., printed in 1834, by the Messrs. Childs, of Bungay.

BURLAMACCHI, FRANCESCO, a citizen of the republic of Lucca, about the year 1546 attempted a revolution in Tuscany against the Grand Duke Cosmo I., for the purpose of re-establishing the republican government. Like several of his countrymen, and other Italians of Siena, Ferrara, and other towns, Burlamacchi was secretly inclined towards the Protestant doctrines, which appeared

favourable to political liberty, as their antagonist, the Papal power, supported the absolutism of Charles V. Burlamacchi held correspondence with the Protestants of Germany, who were then in arms against the emperor; and his plan seems to have been that of a general insurrection against the Papal and the imperial powers throughout Italy. With this view he had secret intelligence with the disaffected at Bologna, Perugia, and other towns of the Papal state, as well as with the Strozzi and other Florentine refugees. Being elected gonfaloniere, or chief magistrate, of the republic of Lucca, he had at his disposal nearly 2000 militia of the mountaineers of the Apennines, the captains of which were devoted to him. With this force he intended to surprise Pisa, and thus give the signal for insurrection. The plot was nearly ripe, when the indiscretion of one of the conspirators revealed the whole to Cosmo. The magistrates of Lucca, being informed of it, arrested Burlamacchi and put him to the torture, when he confessed the plot; but they refused to deliver him up to Cosmo. Ferrante Gonzaga, the imperial lieutenant at Milan, soon after demanding the prisoner, the magistrates were obliged to send him to Milan, where he was again examined under the torture, and afterwards executed for high treason. In consequence of this, some relatives of Burlamacchi and several other families of Lucca left their country, and settled at Geneva, where their descendants remain to this day. (Botta, *Storia d'Italia, continuata da quella del Guicciardini.*)

BURLAMAQUI, JACQUES JEAN, was born at Geneva in 1694, of a family, originally from Lucca, named Burlamacchi, the termination of the name having been altered according to the French orthography. Burlamaqui became professor of law in the academy or university of Geneva; and he was for a time tutor to the Prince Frederick of Hesse Cassel, with whom he resided some years in Germany. On his return to Geneva he was made Councillor of State. He is chiefly known by his work entitled 'Principes du Droit Naturel et Politique,' which was published after his death; it obtained considerable reputation, and was adapted for the use of schools. The work is written in a clear style, and is well arranged, the author having condensed what was most essential and valuable in the works of his predecessors, Grotius, Puffendorf, and Barbeyrac. Burlamaqui died at Geneva in 1748.

BURLEIGH, LORD. [Cecil.]

BURLESQUE, a word derived from the Italian adjective 'burlesco,' which is applied to qualify words, gestures, or expressions of the countenance intended to excite laughter. The Italian verb 'burlare' means to mock or mimic, and also to laugh at a person and make him a dupe. In the latinity of the middle ages we find 'burlare' used as synonymous with 'ludere.' (Ducange.) The burlesque style is applicable both to conversation and pantomime, and to written composition and the art of drawing. Facetious anecdotes and repartees exposing some blunder or turning something into ridicule are styled burlesque. The burlesque style however is most common in poetry, and may be defined to be a sort of good-humoured satire. There is a class of burlesque poems in every language, such as Hudibras and Beppo, in English; but of all modern languages the Italian abounds most in this species of composition, which is called 'poesia burlesca,' or 'poesia giocosa,' and also 'poesia bernesca.' [Barni.] This species of poetry is divided into several branches, each cultivated by numerous writers both in the Italian and in the dialects of Italy. (Aldeano, *Della Poesia Giocosa.*) The burlesque in the art of drawing is shown in the English caricatures, and in the sketches of low life and merry-making exhibited by many of the Dutch and Flemish painters, and also in the representations of deformed and uncouth figures, such as are found among ancient and modern sculptures. Monstrosities however, which excite a sense of horror or disgust, cannot be properly called burlesque productions, the essential quality of the latter being to excite laughter. For the same reason, satires of the invective kind reproaching gross vice, such as Juvenal's, are quite distinct from burlesque compositions.

BURLETTA (from *Burlare*, Ital., to joke, to banter, to play), a comic operetta, or short opera: a musical farce.

BURLINGTON, a county in the state of New Jersey, in the United States of America, extends from the Atlantic coast on the S.E. to the river Delaware and Huntingdon county on the N.W. The country is generally level and is well watered; the soil is not fertile, but nearly the whole is

under cultivation. The population in 1830 was 31,066 souls.

The town of Burlington, in this county, which is not however the county town, is situated on an island in the Delaware, about 11 miles below Trenton. It was founded in 1688, and is a regularly built town with wide streets. Many of the inhabitants are engaged in the fishery, the produce of which forms a considerable branch of traffic with Philadelphia. The Camden and Amboy railway, 61 miles in length, commences at Camden on the Delaware, opposite to Philadelphia, and runs nearly parallel with the river to Burlington: it thence proceeds to Bordentown, where it leaves the river, and passing through Hightstown and Spottswood, ends at South Amboy, at the mouth of the river Raritan.

(Thompson's *Alcedo*; *American Almanac and Companion*.)

BURLINGTON, the county town of Chittenden county, state of Vermont, in the United States of America, is situated on a beautiful harbour on lake Champlain, near the mouth of Onion river. It stands on elevated ground, and commands a fine view of the lake and the surrounding country. It is a place of considerable trade, and nearly all the vessels which navigate the lake belong to this port.

The university of Vermont, at Burlington, was incorporated in 1791, but was not opened to students until 1800. The building, which is of brick, stands on the east side of the town, about a mile from lake Champlain, and as it is 245 feet above the surface of the water, it commands a delightful prospect. The building first raised was destroyed by fire in 1824, and has been replaced by three distinct erections, one of which contains the chapel and other public rooms, and the other two are appropriated to the lodging and accommodation of the students. The university possesses considerable endowments, consisting principally in lands. In every township in Vermont, with some few exceptions, an assignment of land has been secured to the university; only a part of this land, yielding a revenue of 2,500 dollars, has hitherto (1834) been rendered productive. There is a good medical school attached to the university. The number of students in 1833 was 50, and of alumni about 200. The annual charge to the general students for tuition and rent of apartments is 25 dollars: the expense to medical students is about 60 dollars.

There is a joint stock bank at Burlington, with a capital of 150,000 dollars; besides which the bank of the United States has an office there for discount and deposits.

The population in 1830 was 3,526. The town is 38 miles W.N.W. from Montpellier, the capital of the state, and 516 miles N.N.E. from Washington.

(Thompson's *Alcedo*; *American Almanac and Companion*.)

BURLINGTON, EARL OF, RICHARD BOYLE, third earl of Burlington and fourth earl of Cork, was born on the 25th of April, 1695. He travelled much in Italy, where he acquired a strong love for architecture. In 1720-21, he married the Lady Dorothy Savile, eldest of the two daughters and co-heiresses of William Savile, marquis of Halifax. Charlotte, the youngest of three daughters by this lady, married the duke of Devonshire. The life of the earl of Burlington presents very few incidents. In 1730 he was installed Knight of the Garter, and in the following year he was appointed captain of the band of Gentlemen Pensioners, a post which he resigned in 1733. The title of Burlington became extinct at his death in 1753, but has since been revived.

Among his architectural works, he repaired Inigo Jones's church of St. Paul, Covent-garden, and erected at Chiswick a gateway by the same architect, which once stood at Beaufort-garden, in Chelsea. His knowledge of his favourite art was always at the command of others. He assisted Kent (whom he also maintained in his house) in publishing Inigo Jones's designs for Whitehall, and at his own expense he printed an edition of *Fabrice antiche designate da Andrea Palladio, 1726*, a work on ancient baths, from the drawings of that great architect. A country house, built by Palladio, near Vicenza, called the Villa Capra or Rotonda, furnished the idea of a house at Chiswick, which has since received large additions, and which, notwithstanding the well-known sarcasm, "that it was too little to live in, and too big to hang to a watch-chain," must still be considered as a model of very pure taste. Among his other works are some on his own estate at Lambethborough,

in Yorkshire; the front of a house in Piccadilly (Burlington House), built by his father, and the colonnade within its court; the Dormitory at Westminster school; a house at Petersham for Lord Harrington, which afterwards belonged to Lord Carysfort; the duke of Richmond's house in Whitehall, and another for General Wade, in Cork-street. Our remembrance of the duke of Richmond's is by no means favourable; and that for General Wade, however beautiful in its elevation, was so ill distributed, that Lord Chesterfield remarked, 'Since the General could not live in it at his ease, he had better take a house over against it, and look at it.' But the Assembly-room at York is esteemed to be his *chef-d'œuvre*. The eulogy of Pope in his fourth Moral Essay, the epistle on the use of riches, which he addressed to the Earl of Burlington, is by no means exaggerated:—

'You too proceed! make falling attic your care;
Erect new wonders, and the old repair;
Jones and Palladio to themselves restore,
And be what'er Vitruvius was before!'

BURLOS. [EGYPT.]

BURMAN EMPIRE. [BURMAN EMPIRE.]

BURMAN, the name of a family much distinguished for learning. **FRANCIS BURMAN**, son of a Protestant minister, was born in 1632, at Leyden, where he received his education. Having officiated to a Dutch congregation at Hanau in Hessen, he returned to his native city, and was nominated regent of the college in which he had before studied. Not long afterwards he was elevated to the professorship of divinity at Utrecht, where he died November 10th, 1679, having established considerable reputation as a linguist, a preacher, and a philosopher. His works, for the most part, are Commentaries on some of the books of the Old Testament, or Exercises on acedemical subjects.

One of his sons, **FRANCIS**, was also divinity professor at Utrecht, where he died in 1719.

Another son, **PETER**, obtained greater reputation than either his father or his brother. He was born at Utrecht, June 26, 1668, and after his education there under Grævius and James Gronovius, he studied the law at Leyden, and travelled into Switzerland and Germany. On his return to Utrecht, he practised as an advocate, and was afterwards engaged in a public office requiring considerable attention, and married a wife of good family, by whom he had ten children. His love of classical literature, however, was so predominant, that in spite of brilliant success at the bar, he accepted the professorship of eloquence and history at the university of Utrecht, and soon afterwards those of the Greek language and of politics. On the death of Perizonius, he was translated, in 1715, to similar professorships at Leyden, and finally he was promoted to the professorship of history of the United Provinces, and the chief librarianship in the same University. He died in the 73rd year of his age, March 31, 1741. His chief works were editions of Phædrus, Horace, Petronius, Quintilian, Valerius Flaccus, Poetæ Latini Minores, Velleius Paterculus, Virgil, Suetonius, Lucan, Ovid, and, among the moderns, of Buchanan. To these he added a collection of the Epistles of learned men, and some original Orationes and Poems, a treatise ('De Vectigalibus Pop. Rom.') on the revenues of the Roman people, and a Dissertation on the Jupiter Fulgurator. A life of him, written by Dr. Johnson, first appeared in the *Gentleman's Magazine* in 1742.

Another **PETER BURMAN**, nephew of the last-mentioned, and son of his brother Francis, was born at Amsterdam, in 1713. He was professor of history and eloquence at Franeker, and died at Amsterdam, June 24th, 1778. He edited Aristophanes, Claudian, an Anthologia of the Latin poets, and Propertius; and he also published four books of original Latin poetry.

JOHN BURMAN, son of the second-named Francis, was professor of botany at Amsterdam. He was born in 1707, and died in 1780, leaving behind him many works of celebrity on that science in their time. He is principally remembered, however, as being one of the early patrons of Linnæus.

BURMANNIA CEE, a small order of endogenous plants with equitant leaves, and bright blue flowers followed by winged fruits filled with very minute seeds. They are nearly related to Iridaceæ and Hamodoraceæ. (See Lindley's *Natural System of Botany*, 2d edit. p. 330.)

BURN, RICHARD, the author of the 'Justice of the Peace,' and several other laborious and useful compilations, was born at the village of Winton in Westmoreland. He

was educated at Queen's College, Oxford, and in 1762 the university conferred upon him the honorary degree of Doctor of Laws. He was instituted to the living of Orton in Westmoreland in 1736, which he continued to hold until his death in November, 1765. He was in the commission of the peace for the counties of Westmoreland and Cumberland, and was made chancellor of the diocese of Carlisle by Bishop Lyttleton. Dr. Burn is best known as the compiler of the 'Justice of the Peace' and the 'Ecclesiastical Law.' The first of these is an alphabetical digest of the common law and statutes relating to the duties of magistrates and parish officers, comprehending a detailed exposition of the poor-laws; and the second is an abridgment of the English system of ecclesiastical law, also disposed in alphabetical order. The materials for these works were collected by Dr. Burn with great care and accuracy, and arranged in a clear and judicious manner. Their practical utility to magistrates, country gentlemen, and clergymen obtained for them an extensive sale and a high reputation; and numerous editions of both of them have been published. Dr. Burn also compiled, in conjunction with Joseph Nicholson, a nephew of the bishop of Carlisle, a work on the antiquities of Cumberland and Westmoreland, which was published in 2 vols. 4to. in 1777. He also published a history of the poor-laws, and an edition of 'Blackstone's Commentaries,' besides several sermons and works of a religious character.

BURNET, GILBERT, was born at Edinburgh, 18th September, 1643. His father, Robert Burnet, Esq., of Cromont, in Aberdeenshire, was a practitioner of law, and at the Restoration was made one of the judges of the Court of Session. The family was a younger branch of the ancient house of Burnet of Leys, on which a baronetcy was conferred in 1626.

At the age of ten Gilbert was sent to college at Aberdeen, where, after having taken his degree of M.A., he proceeded to prepare himself, by the study of the civil law, for following his father's profession. He soon however gave up this study for that of divinity, and was licensed to preach, according to the forms of the Scotch church, in 1661. Although offered a living by his relative, Sir Alexander Burnet, he considered himself yet too young to undertake such a charge. In 1663 he visited Cambridge, Oxford, and London, and afterwards made a tour through Holland, the Netherlands, and part of France. On his return to England he was made a fellow of the Royal Society, which may be taken as an evidence that he already enjoyed considerable reputation.

In his own country he soon acquired also much reputation as a preacher. He had from the first adopted the practice of preaching extempore, or without writing out his discourses. In 1665 he was, on the presentation of his friend Sir Robert Fletcher, appointed minister of the parish of Saltoun, in East Lothian, on which occasion he received ordination from the bishop of Edinburgh. Here he spent nearly five years, during which, by his charity and his assiduity in the discharge of his duties, he gained the warm attachment of his parishioners. While here also he began his interference in affairs of church and state, by drawing up, in 1666, a strong representation against certain abuses of their authority, which he imputed to the Scottish bishops, and circulating it in manuscript. For this step it is said that Archbishop Sharpe proposed his deprivation and excommunication; but the other bishops did not second the zeal of the metropolitan, and nothing was done.

From 1668, when the administration of Scotland was put into the hands of Sir Robert Murray, and moderate counsels for a short time prevailed, Burnet, young as he was, began to be much consulted by those at the head of affairs. In 1669 he was chosen Professor of Divinity at Glasgow, and from this time also he became more than ever mixed up with affairs of state. Keeping to the line of moderation upon which he had set out, he applied his efforts to reconcile the dukes of Lauderdale and Hamilton, the heads of the two parties which then strove for the ascendancy; but in this attempt he had no success. About this time he is said to have refused one of the Scottish bishoprics, alleging as his excuse that he was too young. In 1669 he published his first work, entitled 'A modest and free Conference between a Conformist and a Non-conformist.' In 1670 or 1671 he strengthened his connexion with the moderate party by his marriage with Lady Margaret Kennedy, the daughter of John the sixth earl of Cassilis, designated by

his contemporaries 'the grave and solemn earl,' who, after having refused to acknowledge Cromwell during all the time of the protectorate, was dismissed from office after the Reformation for scrupling to take the slavish oaths which were then administered. This lady was considerably older than Burnet.

In 1672 he published a work somewhat differing in spirit from the generality of his productions, being in fact something very like a defence of the doctrine of passive obedience, under the title of 'A Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland.' In practical politics however he resisted all the attempts that were made to engage him in support of the oppressive measures of the court. In consequence he drew upon himself so much of the resentment of the duke of Lauderdale, now the ruling authority, that, in 1674, he deemed it best for his safety to resign his professorship, and to remove to London. Here, the same year, after having declined the living of St. Giles's, Cripplegate, he was made preacher at the Rolls Chapel, by Sir Harbottle Grimstone, then Master of the Rolls; and soon after he was elected lecturer at St. Clement's. He was at the same time deprived of his honorary office of one of the chaplains royal, to which he had been appointed some years before. In 1676 he published his 'Memoirs of the Dukes of Hamilton,' which he had drawn up from the archives of the family while he resided at Glasgow. In 1679 appeared the first folio volume of his great work, 'The History of the Reformation in England,' which was received with great favour by the public, then in a very excited state on the subject of popery, and which had besides the extraordinary honour of procuring for its author the thanks of both houses of parliament. In 1680 appeared the most carefully prepared of all his writings, his tract entitled 'Some Passages in the Life and Death of the Earl of Rochester;' being an account of his conversations with that nobleman in his last illness, the result of which was the conversion of the repentant prodigal to a belief in Christianity. In 1681 he gave to the world the second volume of his 'History of the Reformation.' In 1682 he published his 'Life of Sir Matthew Hale.' Overtures were now again made to him by the court, and he was offered the bishopric of Chichester by the king, 'if he would entirely come into his interests.' He still however remained steady to his principles. About this time also he wrote a celebrated letter to Charles, reproving him in the severest style both for his public misconduct and his private vices. His majesty read it twice over, and then threw it into the fire. At the execution of Lord Russell in 1683, Burnet attended him on the scaffold, immediately after which he was dismissed both from his preachingship at the Rolls and his lecture at St. Clement's by order of the king. In 1685 he published his 'Life of Dr. William Bedell, Bishop of Kilmore in Ireland.'

On the accession of James II., Burnet retired to the Continent, and after visiting Paris, continued his travels throughout the South of France, Italy, Switzerland, and the North of Germany, to Utrecht. He afterwards published an account of this journey. Soon after his arrival in Holland he was introduced at the court of the prince of Orange, with whom he became a great favourite. His active exertions in preparing the way for the accession of the prince to the English throne are matter of history. When William came over to this country, Burnet accompanied him in quality of his chaplain, and immediately after the revolution he was made bishop of Salisbury.

In 1698 he was appointed preceptor to the duke of Gloucester, the son of the Princess Anne. While in Holland he had made a second marriage with Mrs. Mary Scott, a lady of Scottish descent, but of large fortune and high connection in that country. Upon the death of this lady, by small-pox, he soon after made a third marriage with Mrs. Berkeley, a widow lady, of good fortune and great piety, the authoress of a work once popular, entitled a 'Method of Devotion.' The remainder of his life Bishop Burnet spent in his episcopal duties, his discharge of which was in every respect most meritorious and honourable; in attendance in parliament, in the business of which he took a considerable share, and where he continued through all changes a zealous partizan of the Whig interest; and in addressing the public with his indomitable pen. In 1699 appeared another of his most celebrated works, his 'Exposition of the Thirty-nine Articles of the Church of England.' It excited great controversy on its first appearance, and was

even condemned as heterodox by the Lower House of Convocation. An elaborate examination of the principles of the work, in so far as the point of subscription is concerned, may be found in the fourth and fifth chapters of 'The Confessional' (by Archbishop Blackburne), pp. 57—171. In 1712 Burnet published separately his 'Introduction' to the third volume of his 'History of the Reformation', in which having indulged himself in some very strong observations on what he considered the then alarming state of public affairs, he drew upon himself the ridicule and abuse of Swift, who retaliated for the government in one of the sharpest satires ever written, under the form of 'A Preface to the bishop's 'Introduction.' In 1714 the third volume of the 'History' itself appeared. It is supplementary to the two former. Having now lived to see the accession of the House of Hanover, an event he had always looked forward to with anxious expectation, as the consummation of the system of national policy which he had consistently supported, the bishop died at his house in St. John's Court, Clerkenwell, London, on the 11th of March, 1715.

The most remarkable of all his works appeared soon after his death, in two volumes folio, under the title of 'Bishop Burnet's History of his Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht in the Reign of Queen Anne.' It was published by his son Thomas (afterwards one of the judges of the Common Pleas), who prefixed to it an account of his father's life. 'Those facts,' says the writer, 'for which no vouchers are alleged are taken from the bishop's manuscript notes of his own life, and can be supported further by other testimonies if occasion should require.' At the end of subsequent editions there is given 'A Chronological and Particular Account of the Works of the Right Reverend and Learned Dr. Gilbert Burnet, late Lord Bishop of Salisbury, corrected and disposed under proper heads, interspersed with some critical and historical observations, by R. F.' (that is, the Rev. Roger Flemyng). This list contains the titles of 39 published sermons, 13 discourses and tracts in divinity, 14 tracts against popery, 25 tracts polemical, political, and miscellaneous, and 20 historical works and tracts.

Bishop Burnet's 'History of his Own Time' was received with a cry of derision—the Tory wit, Swift wrote 'Short Remarks on the book; Arbutnot parodied it in 'Notes and Memorandums of the Six Days preceding the Death of the late Right Rev. —' and Pope in his 'Memoirs of P. P., Clerk of this Court,' turned the satirical and self-important manner of the writer still more successfully into ridicule. In the remarkable one-sidedness of his party zeal, his credulousness and general want of judgment, the looseness of his style, and, as it has been observed, the still greater looseness of his facts, as well as in the too great transparency throughout the whole of the importance of a man to himself, the historian undoubtedly gave considerable provocation to these writers; but still, after all deductions that can fairly be made, the 'History' is a highly interesting and valuable performance, and has preserved accounts of many curious transactions which otherwise would have remained concealed from posterity. Like everything else also that is known of the author, although it shows him to have been possessed of a remarkable share of energy and bustling officiousness, and not to have been a person of the most capacious judgment, his testimony is very favourable to the excellence of his heart and moral nature. Of his disinterestedness, his courage, his public spirit, and even to his ability and talent within the proper range of his powers. Even many of his prejudices in some degrees did him honour. Certainly he was in general a good writer, but besides his want of time he rarely allowed himself sufficient time either for the collection and examination of his materials, or for their arrangement and composition. Yet, with nearly everything so elementary, and a fluency and sometimes a rude strength in his style which make his works upon the same reading almost insupportable.

Dryden has introduced Burnet in the third part of his 'Hind and Par.' in the character of King Burnet, and sketched him personally, morally, and intellectually in some strong lines. The denunciation, however, is more personal as well as a political enemy; for the bishop had little respect for poets, and who for his contemporary mention of 'one Prior has not unjustly been published in a well-known epigram as 'one Burnet' after the fashion of his own phraseology—had chosen in one of his pamphlets,

with great recklessness of assertion, to speak of Dryden as a monster of profligacy.

The last and best edition of Bishop Burnet's great work, his 'History of the Reformation,' is that published in 7 vols. 8vo. (the index forming the last) at Oxford in 1829, with a valuable preface by Dr. E. Nares.

BURNET THOMAS, was born at Croft in Yorkshire about the year 1635. After having been instructed at the school of Northallerton, he was entered at Clare Hall, Cambridge, under the tuition of Dr. Tillotson. On the 11th of Dr. Cudworth in 1664 from the mastership of all to that of Christ's College, Burnet removed with him. He was elected fellow of Christ's College in 1657, and four years afterwards filled the office of senior proctor. On leaving the University he became in the earl of Wiltshire, eldest son of the marquess of Salisbury (soon after the Revolution created duke of Devonshire), that he was afterwards invited to accompany Lord Ossory, grandson of the first duke of Ormond, in capacity.

After publication, after his return, and the work on which his fame almost exclusively rests, was in Latin, 'Tolluris Theoria Sacra,' 1680. Five years after its appearance he was elected master of the Charter House. The precise date of his ordination is unknown, but at that election one of the governors objected to him that he generally appeared in a lay habit. The duke of Ormond however replied, in excuse, that he had neither living nor any other ecclesiastical preferment; and that whatever might be his mode of dress, his life and conversation were in all respects worthy of his sacred profession.

The first opposition to the dispensing power which James II. thought fit to assume, was made by Dr. Burnet about eighteen months after his election to the mastership of the Charter-house. The king addressed a letter to the governors, ordering them to admit one Andrew Popham as pensioner whenever such a place should become vacant in their hospital, without tendering to him any oath, or requiring of him any subscription or recognition, in conformity with the doctrine and discipline of the Church of England. And this was to be done notwithstanding any statute, order, or constitution of the said hospital to the contrary, with which the king was graciously pleased to dispense. In spite of the presence of Lord Chancellor Jeffries, who moved that they should proceed to vote without any debate, Burnet, who as junior governor was called upon to vote first, delivered his opinion that by recent Act of Parliament, 3 Car. II. no officer could be admitted into that hospital without taking the oath of allegiance and supremacy. An attempt was made, but without effect, to overrule this opinion. The duke of Ormond supported Burnet, and on the vote being put Popham was rejected; and notwithstanding the threats of the king and of the popish party, no member of that communion was ever admitted into the Charter-house.

Thus barred from the hope of court preferment during the remainder of the reign of James II., Burnet employed himself in writing in Latin the second part of his theory 'De Conflagratione Mundi,' which appeared in quarto in 1669. He had already in 1684 translated the first part into English, and he added the second part in the course of the year in which it appeared in Latin; if indeed those may be called translations which he himself terms 'new compositions upon the same ground, there being several additional chapters and several new moulded.

On the promotion of Archbishop Tillotson, and by special recommendation that prelate, Burnet succeeded him as tutor of the chapel to King William III., and was considered as on the sure road to preferment. These prospects however were unfortunately marred by a work which he published in 1697 under the title of 'Archæologia Philosophica, seu Doctrina Antiqua de Rerum Originibus.' The work was complete with learning; but the Mosaic account of the Fall was treated as an allegory, with an appearance of irony which gave offence to serious men, and of which Burnet afterwards repented. It contains an imaginary dialogue between Eve and the serpent. The cry raised against him was much increased by the unseasonable praise bestowed by Charles Hoare, a professed infidel, and it was thought expedient that Burnet should retire from the clerkship of the king's closet. The remainder of his days was passed in retirement at the Charter-house, where he died September

7th, 1715, and was buried in the chapel of that institution over which he had presided during thirty years.

Few works have called forth higher contemporary eul than 'The Sacred Theory of the Earth.' It will not stand the test of being confronted with the known facts of the history of the earth; and Flamsteed observed of it that he 'could overthrow its doctrine on one sheet of that there were none to the making of the fine-turned period. Its mistakes arise from herence to the philosophy of Des Cartes, and any of those facts without a knowledge of which such an attempt, however ingenious, can only be considered as a visionary system of cosmogony; but whatever may be its failure as a work of science, it has rarely exceeded in splendour of imagination, or in cal conception. Burnet printed during his few copies of a tract in Latin, 'De Statu Mortuorum surgentium,' one of which having fallen into the hands of Dr. Mead was handsomely reprinted by that gentleman, who did not know the name of its author, present to some few select friends. Only 25 copies printed in quarto; Maittaire revised the text, and many blunders by inserting manuscript notes and adding at improper places from the author's own interlined copy. Upon this the executor of Burnet lent Mead a corrected copy, from which 50 were printed, with a caution to those to whom they were given not to suffer the treatise to be translated, reprinted, or published. The tract however was surreptitiously published, as well as another in Latin, 'De Fide et Officiis Christianorum.' The faulty manner in which both of these treatises were published induced Wilkinson, a friend of the deceased author to whom his papers had come, to republish them in 1737 from Burnet's own corrected copies. To a second edition of the first tract, in 1732, is added an appendix 'De Statu Mortuorum Restitutions,' which it appeared that Burnet had designed so to place.

BURNETT JAMES. [Monmouth.]

BURNETT JOHN, son of Mr. W. Burnett, procurator at law in Aberdeen, was admitted advocate at the Scots bar on the 10th December, 1735, in the 21st year of his age. In 1792 he was made one of the deputies to the Lord Advocate of Scotland, and so continued till October, 1803, when, on the resignation of Lord of Elvingstone, then at the advanced age of 90, he was appointed chief of the same of Edinburgh. In this place he remained till April, 1810, when he was promoted to be judge-admiral of Scotland, in the room of the learned R. H. Cay, deceased. He was also some time standing counsel to the city of Aberdeen. He was author of a valuable treatise on various branches of the criminal law of Scotland, which was passing through the press at the time of his death, the 8th December, 1810.

BURNEY CHARLES, M.A. D., one of the two natives of this country to whom the world is indebted for the only complete histories of music that have yet appeared, was born at Shrewsbury, in 1726. From a few scattered pages of an autobiography which he composed, but which proceeded in, we learn that his grandfather, and his father, Mac to the family name, was a gentleman of a considerable patrimony at Great Hanwood, in Shropshire, who, in 1727, walked as an esquire to one of the knights of the shire of George II.; and that his father was educated at Westminster School under Dr. Busby; but having entered into an imprudent marriage, he incurred the resentment of his parent, and thus lost to himself and descendants the property to which he otherwise would have succeeded. His wife dying, he married again, a second time, and his second choice was Mrs. Ann Cooper, a great beauty, who had rejected Wythley the dramatic poet, the wit, the favourite of the court, the man of letters, and the favourite of the ladies of the highest rank. For James Burney, then seeking to establish himself as a provincial paragon, from this union proceeded the subject of the present article, who was unaccountably neglected by his parents, and was not only during his infancy but in his boyhood, to the care of an ignorant though worthy old nurse, in the village of Condover, near Shrewsbury. At length however he was entered at the free school of the latter place, but soon removed to the public school at Chester, in which city he also commenced his musical studies, under Mr. Baker, organist of the cathedral, and a disciple of the famous Dr. Blow. When he had attained his fifteenth year he returned to his native place, and received further instructions in the art

of music, from an elder half-brother, the organist of St. Mary's, Shrewsbury. He then went to London, and was placed for a term of three years under Dr. Arne, from whom he doubtless gained some knowledge, but in a very desultory way, for the habits of that distinguished composer were by no means of a regular kind; and we have reason to believe that his pupil learnt much less from him than from the many opportunities afforded in the metropolis of hearing the best music, especially that of Handel performed under the direction of the great master himself.

In 1749 Mr. Burney was elected organist of a church in the city; and about the same period he had a subscription concert at the King's Arms, Cornhill. He was now introduced to the great actress, the idol of the theatre, Mrs. C. Arne, at whose house in Scotland yard he became acquainted with most of the poets, poets, and men of letters of the day, and by his courteous manners, lively conversation, and powers of pleasing, as the foundation of that intimacy with persons eminent for talent or elevated by birth and fortune, which proved of the utmost importance to him for the rest of his life. This also led to his composing the music of three operas for Drury-lane theatre — Mallot's tragedy, 'The Two Friends,' 'The Two Friends,' 'The Two Friends,' and 'The Two Friends.' The success of the latter was remarkable; it was taught to all young ladies, set to all female voices, and played at all familiar music-parties. Nevertheless the young composer preserved a strict decorum, which his daughter, Madame D'Arbly, accounts for by supposing that as he was still under articles to Dr. Arne, he was distinguished from the liberty of publishing in his own name. But from this thralldom he was emancipated by one into whose favour he had ingratiated himself, the accomplished E. M. Greville, Esq., then considered 'the most gentlemanly about town,' who proposed terms to Dr. Arne for the release of his pupil, which were accepted, and Mr. Burney became an inmate in the house of his liberator, whose friendship for his protégé death alone dissolved. His residence at Mr. Greville's seat, Wilbury House, near Andover, was the means of much extending his intercourse with the literary and persons of rank. When Mr. Greville married Miss Fanny Macartney — the third of Horace Walpole's 'Beauties' — Mr. Burney gave the lady away: he was also the proxy of the Duke of Beaufort, as god-father to the first fruits of that duke's daughter, afterwards the beautiful Mrs. (who became Lady) Crews.

Mr. Burney was soon afterwards united to Miss Esther Sleeps, a young lady to whom he was ardently attached, and who is described by Madame D'Arbly, in language that may be supposed true, as a daughter, in whom the most valuable and desirable qualities, both mental and personal, were combined. Indeed, a poem to her memory, written in elegant verse, with great and unaffected feeling, by her formerly married husband, and found after his decease among his papers, attests so fully to the substance of what Madame D'Arbly has said, and confirms all that we have already heard of Mr. Burney's many virtues. He now resided in London, and may be said to have seriously commenced his first and his professional career. Several of his compositions were published, when he was attacked by a dangerous illness, from which he recovered through the assistance of Dr. Keene, now only known as a poet. But the disease was attended with symptoms which were thought to be of a nervous complexion, and he was earnestly advised to leave London, and to go to the country. He therefore quitted the metropolis in October, 1750, with a salary of 1200*l.* and resided in the country till 1752. There he began to publish the 'Critical History of Music,' and there commenced that correspondence with Dr. Arne, which subsequently increased the intimacy and friendship.

As his health being completely restored, Mr. Burney returned to the metropolis, and soon had his time fully occupied by his professional pursuits. Six years after he produced at Drury-lane theatre, the 'Cunning Man,' founded on, and adapted to the drama, the 'Cunning Man' of Villiers. In 1756 the university of Oxford conferred on him the degree of Doctor in Music, on which occasion he produced, as an exercise, an oratorio, which was afterwards performed in Germany under the direction of the famous Emanuel Bach. His primary object however was his 'History,' and as he found that much of the materials for this

could only be obtained by a personal examination of the great libraries of Europe, and by conversation with some distinguished professors on the continent, he set out from London in June, 1770, amply supplied with letters from the earl of Sandwich to the several English ambassadors and accredited agents abroad. He visited Paris, where, at the English ambassador's table, he first became acquainted with David Hume. At Geneva he had an accidental interview with Voltaire. Thence he proceeded to Turin, and all the principal cities of Italy, hearing and reading everything connected with his inquiry. Of this tour, he gave an account in his '*Present State of Music in France and Italy*,' a work, the arrangement of which was professedly imitated by Dr. Johnson, in his '*Tour to the Hebrides*,' who emphatically said, 'I had the Musical Tour of that clever dog, Burney, in my eye.'

In the year 1772, Dr. Burney proceeded again to the continent. In order to complete his inquiries, he found it expedient to visit the Netherlands and Germany. At Vienna he formed an intimacy with Metastasio, and became acquainted with Hasse and Glück. From the capital of the Austrian dominions he went by Prague, Dresden, and Berlin, to Hamburg. In the latter city he passed a great deal of time with C. P. E. Bach, from whom he gained much interesting information concerning the numerous and celebrated family of harmonists, and relative to other objects of his inquiry.

In 1773 Dr. Burney was elected a fellow of the Royal Society.

The first volume of the *History of Music* appeared in 1776; the second in 1782; and the third and fourth in 1789. The Commemoration of Handel in 1784, an event of too much importance to remain imperfectly recorded, likewise employed Dr. Burney's pen. At the desire of his friend the earl of Sandwich, he wrote an account of those celebrated performances, including a good Life of Handel. In 1789 he was appointed, by his friend Edmund Burke, organist of Chelsea college, an office which he accepted rather for the sake of airy and desirable apartments; which he was in consequence enabled to obtain, than with a view to the trifling emolument arising out of it. In 1796 he produced a *Life of Metastasio*, in three octavo volumes, a work written in an admirable style, displaying great candour and taste, and highly interesting to the lovers of the lyric drama and music; though many of the poet's letters to his friend Farinelli, the once far-famed soprano, might have been spared. His last literary effort was his contribution to the *Cyclopædia of Rees*, for which he supplied all the musical articles, except those of a mathematical character. The remuneration of this final labour was 1000*l.*, a sum which does not seem inadequate, when it is considered that much of the matter was extracted from his own *History of Music*.

During the whole of his life, Dr. Burney's high Tory principles were openly avowed, though the party never exerted their influence in his favour; but when the Whigs came into power, in 1806, Mr. Wyndham, backed by Mr. Fox, obtained for him a pension of 300*l.*, a grant which, it has been well remarked, 'was more justly obtained in this instance than in nine cases out of ten in which the royal prerogative has been exercised.' This solid proof of his country's esteem was followed, four years after, by a testimony to his merits of the most honourable kind, and the more flattering because proceeding from a government to which he never concealed his enmity—the National Institute of France elected him one of its members, a dignity then never conferred on any but persons whose claim was recognised by all the *savants* of Europe.

From that period, Dr. Burney relinquished every pursuit which called for much intellectual effort; he passed the whole of his time in the society of his family and friends, by all of whom he was beloved and admired. But by almost imperceptible degrees his bodily strength diminished, though his mental vigour continued unimpaired, as the writer of this article had many opportunities of witnessing. The severe winter of 1814 produced a visible and alarming effect on his enfeebled frame; and though the return of spring revived the hopes of those who with affectionate solicitude watched the state of his health, yet it soon too clearly appeared that nature was exhausted. On the 15th of April he tranquilly expired, at his apartments in Chelsea college. His remains were deposited in the cemetery of the college, and attended to the grave by the several members of his

own family, together with a numerous list of persons distinguished by birth, station, and talent.

Several compositions by Dr. Burney were published at different periods, but posterity will only view him in his literary and critical character, in which, it is by all agreed, he attained a very high rank. 'In all the relations of private life,' says one who knew him well, 'as a husband, a father, a friend, his character was exemplary. His manners were peculiarly easy, spirited, and gentlemanlike. He possessed all the suavity of the Chesterfield school, without its stiffness; all its graces, unalloyed by its laxity of moral principle.' (*Harmonicon*, xi. 216.)

Dr. Burney left two sons and four daughters by his first wife; and by a second wife—Mrs. Stephen Allen, of Lynn, a widow—one daughter. He lived to be rewarded for his care and judgment in the education of his children, by witnessing their prosperity; and our account of so eminent a person would be incomplete were we to pass unnoticed those of his progeny who rendered themselves conspicuous by superiority of intellect and activity of pursuit; and here we shall quote again from the work above cited: 'His eldest son, James, entered early in life into the naval service, and accompanied Captain Cook in his second and third voyages round the world. He afterwards commanded the Bristol 50-gun ship on the East India station, where he for some time acted as commodore; and having attained the rank of rear-admiral, died in 1821, in his 71st year. He is known also as the author of many judicious tracts, but more particularly by a most able and laborious *History of Voyages of Discovery in the Southern Ocean*, in five quarto volumes. Dr. Burney's second son, the Rev. Charles Burney, D.D., rector of St. Paul's, Deptford, who survived his father only three years, was one of the most learned and accomplished scholars and able critics, more especially in Grecian literature, of his day. His library was, at his death, purchased by the nation at the expense of 14,000*l.*, and placed in the British Museum. The novels—*Evelina*, *Cecilia*, &c.—written by his second daughter, Madame D'Arblay, formed a new era in that species of composition; and although the manners portrayed in them by so lively a pen are now nearly obsolete, the vivacity of style and variety and discrimination of character are such, that they are still sought after, and read with delight and improvement. A still younger sister followed the track of Madame D. with considerable, though not equal, success.'

BURNING. [BRAND.]

BURNING GLASSES and MIRRORS. Any lens of the convex kind, or mirror of the concave kind, which collects a quantity of light within a very small space, will, if the light be very strong, such as that of the sun, also collect a considerable quantity of heat, which will set fire to many substances; or, if the glass have an aperture of some size, almost any substance whatsoever. This property has been very long known. The last proposition of the treatise on catoptrics attributed to Euclid is, 'By concave mirrors placed opposite to the sun, fire may be kindled;' and the reason is explained, namely, the condensation of the sun's rays. In the '*Clouds*' of Aristophanes (766, &c.) Strepsiades tells Socrates that he has found out an excellent way of cancelling his debts, namely, by standing at a distance from the lawyer who is drawing up the case against him, and destroying the writing by catching the sun's rays in such a burning-glass or transparent stone as people kindle fire with. We may see in ARCHIMEDES that the stories relative to his burning the Roman fleet by mirrors are of comparatively modern authority. From the end of the seventeenth century various experiments have been made with glasses of considerable power; but as no very important results followed, beyond the establishment of the very great effect which may thus be produced, the subject has become of very little importance. We shall however, referring the reader to LENS and MIRROR for all stricter notions upon the subject, state some facts connected with burning glasses in a more popular shape.

It is found that heat alone without light passes very slowly through glass; that even with ordinary light very little heat is transmitted through glass; and that it is only with the full glare of sun-light that any sensible effect can be produced. If a convex lens be held directly opposite to the sun, and allowed to throw an image on a sheet of paper held behind and parallel to it, and if the sheet of paper be moved until the image of the sun thrown upon it appear smallest, the quantity of light transmitted through the

glass, which remains the same throughout, is then thrown upon the smallest quantity of surface, and presents the greatest condensation of light and heat which the glass will afford. The same phenomenon would be perceived in a concave mirror, with this defect, that the surface which is held before it must intercept a part of the light.

Two glasses were made by Tschirnhausen, before 1699, which are among the earliest of the attempts to produce considerable effects; the first of 33 inches diameter and 7 feet focal length, the second of the same diameter and 12 feet focal length (old Parisian measure). A second lens received the rays and diminished the focal distance. The effect was to burn small portions of wood, or bad water, also in small quantities, in one moment; to melt small pieces of metal, to vitrify slate, &c.; to melt pitch and rosins under water. But the most complete effect was produced from a lens made by M. de Trudaine, about 1774, which did not consist of glass alone, but was a hollow lens of glass, filled first with spirits of wine, which was afterwards changed to terebintine oil. It held 140 pints (Parisian), and filled with the latter substance had about 11 feet of focal length. According to M. Brisson (afterwards cited), who made the experiments, a bar of steel, four inches long and a third of an inch square (Parisian), was completely melted in five minutes. A silver coin of three livres was melted in a few seconds, and one of six livres in nearly the same time; grains of platinum were sufficiently melted to cohere, though not to form a spherical drop.

M. Buffon, remembering the story about Archimedes, endeavoured to form mirrors which should burn at a great distance. The disadvantage of trying to gain power by increasing the aperture lies in the great relative increase which is thereby given to the small image of the sun. No spherical glass or mirror refracts or reflects rays accurately to a point. The plan of M. Buffon was to make his mirror consist of a large number of small plane mirrors, 400 in number, so placed that they should all reflect their several images of the sun on the same point. He thus burnt wood at 200 (French) feet distance, melted tin at 150 feet, and lead at 140 feet. [Buffon.]

The only practical application of the burning glass (if it deserve so dignified a name) of which we ever heard is at Paris (or was). A burning-glass is placed in such a way that the sun shall throw its image into the touch-hole of a small cannon, at its greatest height, which thus explodes within a minute or two of noon, if there should happen to be no cloud in the way.

Those who desire more particular information may consult Young's *Lectures on Natural Philosophy*, vol. ii. p. 406, for a list of works; and also Brisson, *Dict. de Physique*, articles 'Miroir' and 'Verre ardent'; and Dr. Hutton's *Math. Dict.*, article 'Burning-glass.'

BURNLEY, a market town and chapelry, in that part of the extensive parish of Whalley which is in the higher division of the hundred of Blackburn, in the county palatine of Lancaster. It is 211 miles N.N.W. from London, 25 N. from Manchester, 53 E.N.E. from Liverpool, 12 N.E. from Blackburn, and 11 S.E. from Clitheroe.

The town is pleasantly situated, chiefly in a narrow vale, forming a tongue of land on the banks of the Brun or Burn, from which it derives its name, about a mile and a half above the confluence of that river with the Calder. Its pop., which now amounts to 7551 inhabitants, has rapidly increased since the commencement of this century, as the decennial census exhibits during that period:—1801, 3305; 1811, 4368; 1821, 6378; 1831, 7551. According to the two last assessments for the county rate, the annual value of the land, messuages, and other buildings in the township shows a corresponding augmentation. In 1815 the annual value was returned at 8,642*l.*, and in 1829 at 15,879*l.*

The boundaries of the chapelry include Burnley township, 7551 inhabitants; Haberglam Eaves township, 5817 inhabitants; Brierscliffe with Kewstle township, 1755 inhabitants; and Worsthorn township, 798 inhabitants; making a total population of 16,921.

The name of this town is not found in the ancient itineraries. There have been however so many remains of Roman antiquities—coins, pottery, and urns containing ashes and calcined bones—discovered about the place, that Dr. Whitaker's conjecture of its having been a settlement upon a public way, between Ribchester and Cambodunum, lying, as it does, in a straight line between those two places, seems to be well founded. Some Saxon remains have also

been found; and at a small distance E. of the town, is a place called *Saxifield*, which tradition has marked as the scene of a battle in the times of the heptarchy. Adjoining the town and near the church is a cross which is supposed to commemorate the preaching of Paulinus, the first Christian missionary in these parts, about the year 597, and to indicate the spot on which the inhabitants assembled for religious worship prior to the erection of the church.

Though an old town, the greater part of Burnley is of recent erection, and the houses are chiefly built of freestone which is found in the neighbourhood. During the last few years considerable improvements have been made, under an act obtained in 1819 for that purpose: the town has been lighted with gas, the streets have been well paved and the foot-paths flagged, and excellent waterworks have been established, supplied from two elevated reservoirs, one to the N. and the other to the S. of the town. The barracks in the adjoining township of Haberglam Eaves were erected in 1819, at a cost of 5500*l.*, of which sum 2500*l.* was raised by voluntary subscription. The workhouse stands in Rayle Road.

The trade of Burnley was formerly confined to woollens but the cotton manufacture is now the staple of the place. On the two rivers around the town there are extensive establishments for spinning and weaving cotton and printing cloth, besides several mills for grinding corn, and one for fulling cloth. In other parts of the town are brass and iron foundries, machine shops, bleach-works, roperies, tanneries, and breweries. The Leeds and Liverpool canal, which nearly surrounds the town, opens a communication for the conveyance of goods through the whole line of country, from the German Ocean to the Irish Sea. Coal, freestone, and slate are found in abundance close at hand and in the vicinity: some veins of lead have also been discovered.

The government of the town is vested in a constable, annually chosen. Four magistrates, who act for the hundred, hold a petty sessions every Monday, and meet in rotation, generally two at a time. The charter for the market was granted in the 22nd of Edward I. to Henry de Lacy, Earl of Lincoln, to be held on Tuesday: but that day has been changed to Monday and Saturday. Fairs are held on March 6th, Easter eve, May 9th and 13th, July 10th, and October 11th. There has also been since 1819 a fair for fat and lean cattle, on every alternate Monday. The annual wool-fair is held on the second Thursday in July, and the fair for horses on the third Thursday in October.

The parochial chapelry of Burnley, dedicated to St. Peter, was one of the three churches existing in the parish of Whalley in the reign of Henry I.: but nothing remains of the ancient structure, which was built soon after the Conquest. The present edifice has undergone much alteration: it had originally four chantries, namely, the rood altar, placed upon the rood-loft at the entrance of the choir, now removed; the altar of St. Peter; the altar of St. Mary; and the altar of St. Anthony. It is a spacious structure; but having been rebuilt and enlarged at different times, it combines various styles of architecture. At the E. extremity of the S. aisle is the Stansfield choir, in which there is an ancient grave-stone with a cross fleury and sword; and at the E. end of the N. aisle is the chapel of the Virgin Mary, the property and burial place of the Townley family: it contains some shields of arms, and a monument to the memory of Charles Townley, Esq., whose collection of marbles is now in the British Museum. The living is a perpetual curacy in the archdeaconry and diocese of Chester, endowed with benefactions which make it the best curacy in the kingdom. In the reign of Edward VI. the incumbent of Burnley 'had for his wages yearly the sum of 4*l.* 8*s.* 11*d.*' as appears from 'an inquisition' taken at Manchester in 1583; but now, from various donations aided by Queen Anne's bounty, it amounts to upwards of 500*l.* per annum. Forty-eight acres of glebe land are attached to the chapelry. The living is in the gift of Robert Townley Parker, Esq. of Guerdon Hall, near Preston. There are places of worship belonging to the Baptists, the Roman Catholics, the Wesleyan Methodists, and the Independents. These places of worship have Sunday-schools attached to them, in all of which the children of different religious denominations are received and instructed.

The free grammar-school is in North Parade. A part of the chantry of St. Mary on the W. side of the churchyard was formerly used as a school-house, until 1695, when the present building was erected. It is supposed to have been

founded in the reign of Edward VI. The endowments of the foundation amount to about 140*l.* per annum, which forms the salary of the head master, who teaches the classics and exercises a general superintendence over the lower school. In this school English, writing, accounts, and practical mathematics are taught by an assistant, who is remunerated by a charge of three guineas a year, which is allowed to be made to the scholars. Two guineas a year is the sum charged for the sons of persons in humble life. The average number of scholars is about sixty, of whom ten or twelve are instructed in the classics. The school has an interest in thirteen scholarships founded in Brasenose College, Oxford, by Dr. Nowell, Dean of St. Paul's, London, in 1572. The master is appointed by the trustees of the land belonging to the school. In a room over the school is a valuable library, left by the Rev. Henry Hasted, rector of Stansfield, for the use of the scholars. The Rev. Dr. Whitaker, the learned master of St. John's College, Cambridge, and the historian of the 'original parish of Whalley,' received his early education in this school.

There are also five national schools in the chapelry, in which nearly 2000 children receive the rudiments of education, and are instructed in the principles of the established church: these are supported by subscription. In the same manner also is supported a charity for poor married women in childbed; and a Strangers' Friend Society. Other charities, to a considerable amount, are distributed annually among those for whose benefit they were intended: Madam Isabel Shirburne's, 9*l.* for the use of the poor; Robert Hasted's, a moiety of 5*l.* 7*s.*, for the same purpose; Mrs. Elizabeth Peel's, 22*l.* 10*s.* for clothing the poor; Mrs. Mary Hindle's, 20*l.* 5*s.* for relieving old and infirm poor persons; Mrs. Hargreave's, 9*l.* for clothing poor and infirm widows.

Burnley is one of the places appointed under the Boundary Act for taking votes at the election of knights of the shire for the N. division of the county. (*Communication from Lancashire.*)

BURNS AND SCALDS. Burns are produced by heated solids; scalds by heated fluids. The severity of the injury is dependent mainly on the intensity of the heat of the burning body. Fluids are not capable of acquiring so high a degree of temperature as some solids; hence the immediate effect of scalds is generally less violent than that of burns. But, on the other hand, fluids flow about with great facility, and the accident often causes a very large surface of the fluid to be thrown upon the body, so that a scald which produces only a moderate degree of inflammation sometimes becomes exceedingly severe on account of its extent. As heated fluids part with their caloric in being diffused, a scald is almost always attended with a different degree of injury in different parts of its course. The extent of the surface involved, the depth of the injury, and the sensibility of the part affected, must all be taken into account in estimating the danger of the accident in any given case. A burn which produces the instantaneous death of the part it touches may be free from all danger if the injured part be circumscribed within a small compass. The worst burns which occur arise from the explosion of gunpowder, or of inflammable gases, or from the female dress catching fire; and the worst scalds from the boiling over of heated fluids in breweries, manufactories, laboratories, &c.

The immediate seat of the injury produced by burns and scalds is the skin, which is a highly organized membrane, performing a very important organic function, and endowed with a high degree of sensibility. The organic function performed by it is the secretion of a quantity of aqueous fluid from the blood, which is carried out of the system under the form of perspiration. [PERSPIRATION, CUTANEOUS.] The secretory arteries of the skin are excited to such an unusual degree of action by the stimulus of the heated body, that they pour out an aqueous fluid in such quantity as to lift the cuticle from the cutis or true skin [SKIN], and form a vesicle or bladder full of fluid. Such is the violence done to the true skin, that the function of all the injured portion of it is suspended; additional labour must therefore be imposed on some other organ, which must be its substitute and perform its work, otherwise a fatal disturbance will take place in the system. The lung exhales the same aqueous fluid as the skin. [TRANSPIRATION, PULMONARY.] In proportion as the cutaneous perspiration is diminished, the pulmonary transpiration is increased; but when a large extent of the skin is destroyed, the lung is inadequate to the task imposed upon it; it cannot perform its own work

and that of the skin also, and in this case great difficulty of breathing invariably comes on, and the danger is exceedingly increased by this oppression of the lung.

But there is spread over the external surface of the true skin an immense number of sentient nerves, rendering it an organ of sense. A burning body applied in such direct contact with the sensitive extremities of these nerves occasions violent pain; and this, in consequence of the sympathy which is established between all parts of the body, produces a great disturbance of the system. The abolition of the organic function, and the disturbance occasioned to the sentient part of the nervous system, both combined, often prove fatal.

Since the severity of the injury must always be mainly in proportion to the length of time the burning body continues in contact with the skin, it is important that every one should impress upon his mind the course which it is best to take in case of accidents from burns.

The upright posture is obviously not only favourable to the spreading of the flames, but to their reaching the more important parts of the body, the neck and head. Any motion of the body to and fro gives great advantage to the flames, by bringing fresh currents of air into contact with the burning materials, and it is therefore utterly absurd to run screaming about. Fall upon the floor; keep rolling over and over upon the carpet; if possible seize the hearth-rug, or the table cover, and, enveloping the body in it, keep rolling about upon the carpet until assistance comes. The duty of the assistant is to seize the hearth-rug, or the table-cover, or a shawl, or to strip himself of his coat, or to seize any woollen or flannel clothing at hand and to envelope in it as closely and completely as possible the person on fire.

The thing to be done with the burnt or scalded parts is instantly to immerse them in cold water, ice-cold if it can be got. Should the position of the parts not allow of their immersion in water, cloths should be applied to them dipped in water, and kept constantly wet. As a means of applying and retaining cold, scraped potatoes or turnips are useful. Some persons recommend, instead of those cooling applications, stimulating substances, such as the strongest brandy, spirits of wine, oil of turpentine, or vinegar, kept on the affected parts by means of old linen or lint soaked in the fluid. The use of these applications, whether the cooling or the stimulating, should be persisted in until the pain ceases; the parts should then be dressed, as some recommend, with the yellow basilicon ointment, softened with the oil of turpentine; or, as others prefer, with emollient poultices often renewed. It is singular that, common as this piece of surgery is, practitioners are not agreed which of these two plans, the cooling or the stimulating, is the most efficient; and comparative trials have not yet been made on a scale of sufficient extent to determine the question. It is probable that the one may be more advantageous than the other under different circumstances, which the unprofessional person cannot be expected to discriminate. All that is necessary to be stated here is the most judicious thing to be done, in the very first instance, until professional assistance can be procured; and with this view, perhaps, the only thing that should determine the choice between either of the cooling or stimulating articles just mentioned is the facility with which they can be got. It is probable that the chief effect of all these applications is to prevent the air from coming into contact with the true skin; that is, to perform the office of the cuticle which is destroyed. Accordingly, some of the most distinguished surgeons state that they have produced the very best effects by merely covering the affected parts with old linen saturated with oil, by which the air is effectually excluded. On this ground it is probable that a remedy, occasionally recommended, will prove in practice as useful as any, namely, enveloping the part in cotton; and if so, it will be better than any, both on account of its lightness, and from the ease with which every mistress of a family can always have abundance of it at hand.

BURNS, ROBERT, was born on the 25th of January, 1759, in a small cottage about two miles to the S.W. of the town of Ayr. His father, William Burnes, was the son of a farmer in Kincardineshire, but in consequence of the reduced circumstances of his family he had left that part of Scotland in his youth to seek employment in the South as a gardener. After serving different masters for a number of years, he had on his marriage in December, 1757, taken a perpetual lease, or feu, as it is there called, of seven acres

of land, with the view of setting up for himself as a nurseryman. Here he built with his own hands the humble dwelling in which Robert, his eldest son, was born.

The history of the poet's early life has been very fully related both by himself and by his brother Gilbert. The narrative of the latter, in particular, is one of the most beautiful and touching ever written. The life of William Burness was one continued struggle, which he carried on with the honourable pride common among his countrymen to better his circumstances, and to give his children a good education. Robert was first sent to a school about a mile distant, in his sixth year. Afterwards a young man was engaged by William Burness and four of his neighbours to teach their children in common, his employers boarding him in turns. When they had removed to another situation, which precluded them from this advantage, the good man, after the hard work of the day, endeavoured to instruct his children himself. 'In this way,' says Gilbert, 'my two eldest sisters got all the education they received.' Robert obtained a little more school instruction by snatches, but the amount altogether was very inconsiderable. His chief acquisition was some acquaintance with French, and for this he was almost entirely indebted to himself. What other knowledge he obtained he gathered from the few books, mostly odd volumes, which his father could contrive to borrow. At last, in the beginning of the year 1781, William Burness died, worn out with toil and sorrow, after living just long enough to learn that a law-suit in which he was engaged with his landlord had been terminated by a decision which involved his family in ruin. He left five children younger than Robert and Gilbert.

In these circumstances, the youth and early manhood of the future poet were dark enough. 'The cheerless gloom of a hermit,' he says himself, 'with the unceasing moil of a galley-slave, brought me to my sixteenth year.' His brother Gilbert writes, 'To the buffetings of misfortune we could only oppose hard labour, and the most rigid economy. We lived very sparing. For several years butchers' meat was a stranger in the house, while all the members of the family exerted themselves to the utmost of their strength, and rather beyond it, in the labours of the farm. My brother, at the age of thirteen, assisted in threshing the crop of corn, and at fifteen was the principal labourer on the farm, for we had no hired servant, male or female. The anguish of mind we felt, at our tender years, under these straits and difficulties, was very great . . . I doubt not but the hard labour and sorrow of this period of his life was in a great measure the cause of that depression of spirits with which Robert was so often afflicted through his whole life afterwards.' Some time before their father's death, and when his affairs were drawing to a crisis, the two brothers had taken another farm, which they stocked in the best way they could with the savings of the whole family. 'It was,' says Gilbert, 'a joint concern among us. Every member of the family was allowed ordinary wages for the labour he performed on the farm. My brother's allowance and mine was 7*l.* per annum each. And during the whole time this family concern lasted, which was four years, as well as during the preceding period at Lochlea, his expenses never in any year exceeded his slender income . . . His temperance and frugality were everything that could be wished.'

A little before his sixteenth year, as he tells us himself, he had 'first committed the sin of rhyme.' His verses soon acquired him considerable village fame, to which, as he made acquaintances in Ayr and other neighbouring towns with young men of his own age, he greatly added by the remarkable fluency of his expression, and the vigour of his conversational powers. The charm of those social meetings, at which he shone with so much distinction, gradually introduced him to new habits. Yet his brother affirms that he does 'not recollect till towards the end of his commencing author (when his growing celebrity occasioned his being often in company) to have ever seen him intoxicated.' His attachment to female society, also, which had from his youth been very strong, was now no longer confined within those 'bounds of rigid virtue,' says his brother, 'which had hitherto restrained him. Towards the end of the period under review (in his twenty-fourth year), and soon after his father's death, he was furnished with the subject of his "Epistle to John Rankin."'

Another affair of this description soon after determined the whole subsequent course of his life. This was his connexion with Jean Armour, afterwards Mrs. Burns, the

fruit of which was the birth of twins. In the difficulties and distress to which both parties were reduced by the consequences of their imprudence, it was agreed between them that they should make a legal acknowledgment of an irregular and private marriage, and that he should then set out for Jamaica to push his fortune. 'But before leaving my native country for ever,' he says, 'I resolved to publish my poems. I weighed my productions as impartially as was in my power: I thought they had merit; and it was a delicious idea that I should be called a clever fellow, even though it should never reach my ears.' An impression of 600 copies of the book accordingly was printed at Kilmarnock. This was in the autumn of 1786. The poems were well received by the public; and after paying all expenses the author cleared nearly 20*l.* 'This sum,' he says, 'came very seasonably, as I was thinking of indenting myself, for want of money to procure my passage. As soon as I was master of nine guineas, the price of waiving me to the torrid zone, I took a steerage passage in the first ship that was to sail from the Clyde, for "hungry ruin had me in the wind." I had been for some days skulking from covert to covert, under all the terrors of a gaol, as some ill-advised people had uncoupled the merciless pack of the law at my heels.' This was to oblige him to find security for the maintenance of his children: for the parents of the mother were so indignant, that, notwithstanding what had happened, they would not allow the marriage to take place, and the children to be legitimized. He proceeds: 'I had taken farewell of my few friends; my chest was on the road to Greenock; I had composed the last song I should ever measure in Caledonia, "The gloomy Night is gathering fast," when a letter from Dr. Blacklock to a friend of mine overthrew all my schemes, by opening new prospects to my poetic ambition. The Doctor belonged to a set of critics, for whose applause I had not dared to hope. His opinion that I would meet with encouragement in Edinburgh for a second edition fired me so much, that away I posted for that city, without a single acquaintance, or a single letter of introduction.'

The result was the introduction of the poet to all who were eminent in literature, in rank, or in fashion, in the Scottish metropolis. The brilliant conversational powers of the unlettered ploughman seem to have struck all with whom he came in contact with as much wonder as his poetry. Under the patronage of the Earl of Glencairn, Dr. Robertson, Professor Dugald Stewart, Mr. Henry Mackenzie, and other persons of note, a new edition of his poems was published, from the profits of which he received nearly 500*l.* In the summer of 1788 he returned to Ayrshire, where his brother Gilbert, who had taken upon him the support of their aged mother, was struggling with many difficulties in the farm they had conjointly taken. Robert advanced 200*l.*, and with the remainder of his money he prepared to stock another farm—that of Ellisland, in Dumfriesshire—for himself. Here he took up his abode in June, 1788, having previously legalized his union with Miss Armour by joining with her in a public declaration of their marriage.

Soon after this, by the interest of Mr. Graham of Fintry, he was appointed, on his own application, an officer of excise for the district in which he lived. The salary which he received in this capacity was originally 50*l.* a year, but was eventually increased to 70*l.* His duties, however, interfered so much with the attention due to his farm that he found himself obliged to resign it to his landlord, after having occupied it for about three years and a half. About the end of the year 1791, he retired with his family to a small house in the town of Dumfries, placing his dependence for the future exclusively on his chances of promotion in the excise.

In Dumfries Burns spent the short remainder of his life. The habits which he had acquired during the sudden and short-lived intoxication of his first introduction to public notice, now gained entire ascendancy over him, as misfortune and disappointment broke, or, at least, embittered, his spirit and enfeebled his powers of resistance. The strong excitements of admiration and applause, by which he had been surrounded at Edinburgh, were sought for at any cost, and among companions of any order who would join him in drowning reflection. Even the prospects upon which he had placed his reliance of advancement in the excise were suddenly overcast, in consequence of some imprudent expressions which he had dropped on the subject of the French Revolution, to which some despicable informer had

called the notice of the Board. It was only through the exertions of his friend Mr. Graham, on this occasion, that he was saved from being dismissed. Ill health and great dejection of spirits at last came upon him, along with the pressure of accumulating pecuniary difficulties. He had produced many of his happiest pieces, and especially the best and the greatest number of his songs, since the appearance of the first Edinburgh edition of his poems. The songs were principally contributed to an Edinburgh publication called Johnson's 'Museum,' and afterwards to a work of much greater pretension, the well-known 'Collection of Original Scottish Airs,' edited and published by Mr. George Thomson. Burns's correspondence with Thomson on the subject of his contributions to this work has been printed, and forms a highly interesting series of letters, as well as a most affecting chapter in the poet's history. Burns's first letter, in answer to an application from Thomson, is dated from Dumfries, 16th Sept., 1792. In this he says, after entering with great zeal into the proposal, 'As to any remuneration, you may think my songs either above or below price, for they shall absolutely be the one or the other. In the honest enthusiasm with which I embark in your undertaking, to talk of money, wages, fee, hire, &c., would be downright prostitution of soul.' In July following we find Thomson sending him 5*l.* with the apology, 'As I shall be benefited by the publication, you must suffer me to inclose a small mark of my gratitude, and to repeat it afterwards when I find it convenient. Do not return it, for, by Heaven, if you do, our correspondence is at an end.' Burns, in his reply to this communication says, 'I assure you that you truly hurt me with your pecuniary parcel. It degrades me in my own eyes.' However, to return it, he adds, would savour of affectation; but he protests in the strongest terms against 'any more traffic of that debtor and creditor kind.' The last letter from Burns in the collection is dated 12th July, 1796. For a year previous, illness had nearly incapacitated him from continuing his contributions. He now writes: 'After all my boasted independence, cursed necessity compels me to implore you for 5*l.* A cruel * * * of a haberdasher, to whom I owe an account, taking it into his head that I am dying, has commenced a process, and will infallibly put me into jail. Do, for God's sake, send me that sum, and that by return of post. Forgive me this earnestness, but the horrors of a jail have made me half-distracted. I do not ask all this gratuitously, for upon returning health I hereby promise and engage to furnish you with 5*l.* worth of the neatest song genius you have seen.'

He died on the 21st of July. His remains were consigned to the earth, with the solemnities of a public funeral, which was rendered remarkably imposing by the voluntary attendance of a vast multitude of persons of all ranks from every part of the surrounding country. Burns left four sons (besides a boy who died in his infancy), all of whom, we believe, still survive.

The first collected edition of the poems and letters of Burns was published by Dr. Currie at Liverpool, in 4 vols. 8vo., in 1800, for the benefit of the poet's wife and family. Of the accounts of his life that have appeared since that by Dr. Currie, the most important are that by Mr. Lockhart, published in 1828, and that by Mr. Allan Cunningham, prefixed to his edition of the works of Burns, in eight vols. 12mo. London, 1834. This is now the most complete and in every respect the best edition of the poet's works. It contains 150 poetical pieces more than in Dr. Currie's edition; and both the poems and the letters are throughout illustrated by explanatory notes. The life occupies the first volume, the poems the next five, and the letters and glossary the two last.

The history of literature scarcely affords another instance of a popularity either so sudden or so complete as that obtained by the poetry of Burns. Even in his own lifetime, and indeed almost immediately after his genius first burst into public notice, his name and his poems were familiar to all ranks of his countrymen. Nor did the enthusiasm for his poetry die away with the generation among whom it was first kindled. His works are still everywhere a cottage-book in his own land, and they are read wherever the English language is understood.

No poetry was ever better fitted to obtain extensive popularity than that of Burns. It has little of either grandeur or richness of imagination, qualities that demand much cultivation of mind as well as a somewhat rare endowment of the poetic temperament for their appreciation and enjoyment.

It is all heart and passion, and every human bosom capable of feeling strongly must be stirred by its fire and tenderness. The themes which Burns has chosen are all of the kind which come home to the natural feelings of men, and his mode of treating them is the most simple and direct. In what he has written, in his native dialect at least, there is no where anything of mere rhetorical ornament or display. The expression is throughout, as truly as that of any poetry ever was, the spontaneous utterance of the thought or sentiment, which falls into measured words as if it and they were struck out together by the same creative act. In his lyrical pieces especially, the passion, and the language, and the melody which is 'married' to the 'immortal verse,' seem to come all in one gush from the full fountain of the heart. In this exquisite truth of style no writer in any language has surpassed Burns. But, with all his nature, he is, like every great writer, also a great artist, nature being the inspiration of his art. Nothing can be more masterly—more demonstrative both of high skill and of general elevation of mind—than the manner in which he triumphs over the disadvantages of a dialect so much vulgarized as that of Scotland had come to be at the time when he wrote. Familiar as his subjects generally are, and bold and expressive as his diction constantly is, we will venture to say that there is not one instance of real vulgarity in all that he has written. Of mere license and indecorum there is certainly no want in some of his productions; but even in his broadest humour, in his most unpardonable violations of moral propriety, in the rudest riot of his merriment and satire, there is never anything that is mean or grovelling, anything that offends our sense of what is noble and elevated. Some of the most immortal of his pieces are distinguished by a studied propriety of expression springing from the finest taste and most delicate sensibility to the beautiful.

BURNT-EAR. *Burnt-ear*, in corn, is a disease in which the fructification of the plant is destroyed and, as it were, *burnt up*; hence its English name and the corresponding term of *charbon* in French and *brand* in German. *Burnt-ear* has often been confounded with *smut*, which is a similar but distinct disease. They differ in this, that in the *burnt-ear* the black powder which appears in the ear is external, and the grain has either never been formed, or its coat has been destroyed, so that the whole ear appears black or burnt. The powder also has no smell, and being easily blown away by the wind, or shaken off in the reaping, little of it adheres to the corn or is mixed with it when ground; and except the loss of so much grain as would have been contained in the sound ears, no great detriment arises to the quality of the corn. The *smut*, or *pepper-brand*, on the contrary, is contained in the body of the grain, which retains nearly its natural form, and is carried along with it into the barn. It is only in the threshing or grinding that the diseased grain commonly called *smut-ball* is broken, when a fetid black powder is dispersed over the sound grain, which greatly deteriorates the flour, and renders the corn unfit for seed, the disease being perpetuated by this black substance. [SARR.] *Burnt-ears* are generally observed in particular most situations, and some lands are much more subject to them than others. The disease has been often attributed to damp and warm fogs succeeding very dry weather; and hence it has been imagined that it was caused by the dews lodging in the ears and producing a species of rotteness. But microscopic observations have decidedly proved that the black powder consists of the minute germs or seeds of a parasitical mushroom, which are developed in the growing ears and live on its substance.

The plants attacked by this disease may be distinguished long before the ear makes its appearance out of the sheath in which it is enveloped in its early state. There is a peculiar greenness of the leaf observable; and when the plant is examined, the young ear may already be seen attacked by the disease and beginning to put on a spotted and black appearance, which increases as it grows, and is perfected when the ear arrives at the state in which the flower should appear. In some cases the plant flowers partially or completely, and the fecundation takes place, so that the germ is developed; but it never approaches to maturity. Its outer skin is soon destroyed by the parasitical fungus, and the whole substance converted into a black powder.

De Candolle, one of the best modern authorities on the physiology of plants, has named this peculiar minute mushroom the *Uredo carbo*, which he distinguishes from that

which produces the smut, and which he calls *Uredo caries*. They are easily distinguished by the size and smell. The *Uredo carbo* is composed of much smaller globules and destitute of smell; both seem to be propagated like other cryptogamous plants by means of extremely minute seeds or germs, which are carried along with the sap into the circulation and vegetate in the ear, where alone it appears that they find the conditions necessary to their growth.

Mr. Benedict Prevost has asserted that having placed the black dust of burnt-ears of wheat in distilled water at the temperature of 10° of the centigrade thermometer (about 50° of Fahrenheit's), he observed that they swelled to twice their original size, and pushed out oblong tubercles, which lengthened to five or six times their diameter, and that they afterwards divided into several branches. After a few days minute grains were observed in the vessels, and the original globules showed an appearance of cells, from which the grains had been ejected. The natural conclusion from this observation, if it be correct, is, that the globules are real bulbs or germs of microscopic mushrooms, which are developed by moisture in favourable situations; and to these the name of *Uredo* has been given, one species being the *Uredo carbo*, which attacks the external parts of the grain, and the other *Uredo caries*, which grows within the grain itself. (See Mr. Benedict Prevost's memoir to the Institute of France in 1807.)

It is doubted by some whether the disease is contagious, because they have never been able to produce it by shaking the black dust of burnt-ears over the sound plants. The reason of this is probably that the exhaling vessels of the surface are not so well calculated to absorb extraneous matter, which can only enter by the spongioles of the roots. Although it is much less dangerous than the smut, because it is readily dispersed by the winds, yet it must more or less infect the soil, and hence the disease is more frequent where it has appeared before, and where those grains which are most subject to the disease, such as wheat, barley, and oats, have been sown in too rapid succession. As it does not adhere to the grain, steeping and washing are not so certain remedies against the infection as in the case of smut; but the best preservative is to drain the land well and keep it in good heart, so that the plants may be vigorous and able to resist the attacks of the parasite: for it is a well-known fact, that weak plants, as well as animals, are much more exposed to the attacks of parasitical plants or animals than those which are vigorous and robust. A judicious change of crops, or a well-established rotation, will in general secure the corn; which is sown in its proper course, from the infection of the *Uredo carbo*, provided the preparation of the land be such as to ensure a healthy vegetation*.

As this disease is extremely common, it has obtained various names in different parts of the country. In England it is best known by the names of blacks, brand, or burnt-ear; and it is often called *smut*, from the supposition that it is a variety of the same disease which attacks the external part of the fructification before the skin of the grain is formed. Whether there may not be some truth in this latter supposition, notwithstanding the opinion before quoted, we do not at present presume to determine.

BURRAMPOOTER. [BRAHMAPOOTRA.]

BURROWING OWL. [OWL.]

BURSA, or BRUSA, the ancient Prusa and capital of Bithynia, is beautifully situated at the foot of Mount Olympus in Asia Minor, in 27° N. lat., 40° E. long. The luxuriant plain which lies in front of the city is covered for many miles with plantations of mulberry trees, which nourish the silkworms that supply the staple trade of the place. The grand mountain in the rear of the town furnishes the finest pasturage, an abundance of timber, and underwood for fuel; and a number of cool perennial springs gush out from the roots of Olympus, supplying the town with a superfluity of the purest water, and fertilizing all the surrounding country. As every house in Brusa has its fountain, the total number is immense, and some of the public fountains and conduits are beautifully constructed. The old traveller Tournesort says, he never saw a city with so many fountains, except perhaps Granada in Spain. The streets are remarkably clean and well paved, particularly the bazaar quarter. Ac-

cording to M. Fontanier, a recent French traveller, Brusa contains 125 mosques, a great number of khans, and a population of about 100,000 souls. The citadel, which commands the town, stands on a rocky eminence, the Acropolis of ancient Prusa. Parts of the walls are of Greek construction, and many ancient fragments are imbedded and mixed up in the Turkish building. Within the fortress there is an old Greek church converted into a Mussulman mausoleum, where repose the bones of Sultan Orcan, his wives, and children. Orcan lived in the fourteenth century, and in 1327 took Brusa (which he made the residence and capital of the Ottoman dynasty) from the unwarlike Greek emperor. The monuments erected over these graves are covered with magnificent Cashmere shawls.

But the most remarkable edifices in Brusa are the thermal baths, which are extensive and magnificent. The finest of them (Eski-kaplidja) is an ancient Greek building. The mineral waters that supply them gush out from the base of Mount Olympus; they have a strong sulphureous odour, and in temperature range from 60° to 70° of Réaumur, that is from 167° to 190° of Fahrenheit. In the environs of Brusa, melons of exquisite quality and fruits of all kinds are cultivated: the Greeks and Armenians there, established make good wine, but the capital produce is silk, which is worked up to a very considerable extent on the spot, and largely exported. The demand in England for Brusa silks is at this moment (April, 1836) much on the increase. The pieces manufactured at Brusa are exceedingly strong, tasteful in design, and very enduring. In many of the articles British cotton yarn is woven with the native silk, and a strong and beautiful stuff is produced from the mixture—the dyed silk, on which flowers or other patterns are wrought, being singularly tenacious of its colour. Brusa is a good market for the cotton yarn, or twist, of Manchester and Glasgow. This article of manufacture is landed at Constantinople, and thence forwarded by caravan to Brusa. On the whole, this is the pleasantest city which the Turks possess in Asia Minor, and in industrial and commercial importance it only yields to Smyrna and its neighbourhood.

BURSARIA (Zoology), the name of a genus of minute *Microzoöia* *apoda*, with a membranous body, short, and a little bent upon itself, so as to be concave below and convex above.

De Blainville observes that this form is very probably composed of species of floating *Planariae*, slightly bent upon themselves, but that he is not certain of this, as he never examined the subjects accurately. He adds that it is still more difficult to say what *Bursaria humulinella*, of which M. Bory has formed his genus *Hirulinella*, is.

Lamarck places *Bursaria* among his Infusoria, observing that their body is delicate and membranous, and remarkable by its concave form on one side, which sometimes puts on the appearance of a boat, sometimes of a purse. Their movements are not lively, and it is said that they are irregular, so that when they describe a spiral line from right to left and raise themselves in the water they move with tolerable swiftness; but when they return or descend they only proceed slowly, a difference of velocity attributable to their form.

Locality. Fresh and stagnant waters, and sea water. Lamarck describes five species, the first of which, *Bursaria truncatella*, is visible to the naked eye, and is found in ditch-water.

According to Ehrenberg, the *Bursariæ*, as well as the *Lorodes*, the *Trachelæ*, &c. have an intestinal tube furnished with cæcal appendages which open anteriorly at the inferior surface of the body, and posteriorly at its extremity. The mouth is without cilia or hooks, and there is no ciliary circle on the front. The *Bursariæ* differ besides from the other two genera by the form of the upper lip, which is compressed, subcarinated, or swollen, and not contracted. The body of the *Bursariæ* is, for the most part, downy.

Example, *Bursaria truncatella*. Müller.

[*Bursaria truncatella*. Natural size and magnified.]

BURSATELLA (Zoology), a genus of marine molluscous animals without any traces of a shell; placed by De Blainville under his second family *Aplysiaceæ* (Aplysians) of his third order, *Monopleurobranchiata*, of his Para-

* Steeping the seed in brine or stale urine, and drying it with fresh burnt lime, as is usually done with wheat, is however a useful precaution, which should be adopted also with barley and oats, wherever burnt-ears have appeared in preceding crops. Sulphate of copper is said to be more efficacious than common salt.

cephalophora monopa. The following is De Blainville's definition of the genus, which, in his arrangement, comes between *Dolabella* and *Notarchus*. Rang thinks it ought to belong to the genus *Aplysia*.

Body subglobular; below, an oval space circumscribed by thick lips indicating the foot, above, a symmetrical oval opening with thick lips, formed by the complete junction of the natatory appendages of the mantle, and communicating with a cavity in which are found one very large free gill and the vent. The tentacula are four, divided and ramified, besides two buccal appendages.

Example, *Bursatella Leachii*, which De Blainville says is the only species of the genus. It is large and a native of the East Indian seas.

[*Bursatella Leachii*]

BURSERACEÆ, a natural order of exogens consisting of balsamic, resinous, or gummy plants with pinnated leaves, and small hermaphrodite or unisexual polypetalous flowers, with a superior ovary seated in a large circular disk. The fruit is a 2-5-celled drupe, with its rind sometimes splitting into valves. It was formerly included, among other orders, in the *Terebinthaceæ* of Jussieu, but it differs from *Amynadaceæ* and *Anacardiaceæ* in its compound fruit. Myrrh, frankincense, oilbalm, balsam of Acouchi, gum elemi, balm of Gilead, and opobalsamum, or balsam of Mecca, are all products of different species of the order. [**BALSAMODENDRON**.]

BURSLEM, a parish and market-town in the northern division of the hundred of Pirehill, Staffordshire, 24 miles from Newcastle-under-Lyne, and about 137 miles direct distance N.W. from London. Burslem is a chief town in the important district called 'The Potteries,' the principal seat of the earthenware manufacture of England. The parish, which is in the diocese of Lichfield and Coventry, has an area of 2930 acres, with a population, in 1831, of 12,714, of which 11,250 belonged to the town. The gross annual income of the living, which is a rectory, is stated at 530/. The township of Halton Abbey and the hamlet of Sneyd are included in the parish.

Burslem has a market twice a week, on Mondays and Saturdays; the market-house is a neat edifice of modern erection, surmounted by a clock. The district of 'The Potteries' is steadily advancing in improvement, and contained, in 1831, a population of 53,000; but from the nature of the employment, the cheapness of building materials, and other circumstances, the number of houses of the annual value of 10*l.* and upwards was only from 1400 to 1500. 'The Potteries' were enfranchised under the Reform Act, and constitute the borough of Stoke-upon-Trent. [**STOKE-UPON-TRENT**.]

There were, in 1835, thirty-seven daily schools and eleven Sunday schools in the parish of Burslem.

(*Beauties of England and Wales*; *Boundary Reports*; *Pop., Econ., and Educ. Returns*.)

BURTON, ROBERT, author of the *Anatomy of Melancholy*, was born at Lindley, in the county of Leicester, Feb. 8th, 1576, and was descended of a reputable and ancient family. He received part of his education at the grammar-school of Sutton-Coldfield, in the county of Warwick; and was admitted a commoner of Brasenose-college, Oxford, in 1593, where he made considerable progress in logic and philosophy. In 1599 he was elected student of Christchurch. In 1616 he was presented to the vicarage of St.

Thomas, in the gift of that college; and at a later period, after the year 1628, he was presented, by Lord Berkeley, to the rectory of Segrave in Leicestershire. It is said that he composed the *Anatomy of Melancholy*, published in 1621, with the intent of diverting his own thoughts from that feeling. These are all the facts and dates recorded by Anthony Wood concerning Burton's life. He died at Christchurch, Jan. 25th, 1639-40, at or very near the time which he had before foretold from the calculation of his own nativity. This coincidence gave rise to a rumour, which probably was jocose rather than serious, at least there is not a particle of evidence to support it, that he hastened his own death that his astrological skill might not be put to shame. He bequeathed two sums of 100*l.* each to the Bodleian and the Christchurch library, the annual proceeds to be employed in purchasing books; and he also ordered that these two establishments should select from his own collection any books which they did not possess. Those acquired by the Bodleian are said by Bliss, in his edition of Wood's *Athenæ Oxon.*, to form one of the most curious additions ever made to that collection. 'They consist of all the historical, political, and poetical tracts of his own time; with a large collection of miscellaneous accounts of murders, monsters, and accidents. In short, he seems to have purchased indiscriminately everything that was published.'

Wood gives the following character of Burton:—'He was an exact mathematician, a curious calculator of nativities, a general-read scholar, a thorough-paced philologist, and one that understood the surveying of lands well. As he was by many accounted a severe student, a devourer of authors, a melancholy and humorous person; so by others who knew him well, a person of great honesty, plain dealing, and charity. I have heard some of the ancients of Christchurch often say that his company was very merry, facetious, and juvenile; and no man in his time did surpass him for his ready and dexterous interlarding his common discourses among them with verses from the poets, or sentences from classical authors; which being then all the fashion in the university, made his company more acceptable.'

Some notion of Burton's habits, and of the peculiarity of his digressive and pleonastic style may be formed from the following sentences, selected at intervals from the Preface to the *Anatomy of Melancholy*:—'I had a great desire (not able to attain to a superficial skill in any) to have some smattering in all; to be *aliquis in omnibus, nullus in singulis*, which Plato commends. . . . This roving humour, though not with like success, I have ever had; and like a ranging spaniel that barks at every bird he sees, leaving his game, I have followed all, saying that which I should; and may justly complain and truly, *Qui ubique est, nusquam est* (which Gesner did in modesty), that I have read many good books, but to little purpose, for want of a good method. . . . I am not poor, I am not rich; *nihil est, nihil deest*; I have little, I want nothing; all my treasure is in Minerva's tower. I still live a collegiate student, as Democritus in his garden, and lead a monastic life, *ipse mihi theatrum*, sequestered from the tumults and troubles of the world.' Then after a long catalogue of the troubles and accidents which befall those who 'run, ride, turmoil, and macerate themselves in town and country,' he continues, 'This I daily hear, and such like both public and private news, amidst the gallantry and misery of the world—jollity, pride, perplexities and cares, simplicity and villainy, subtlety, knavery, capdow, and integrity, mutually mixed and offering themselves; I rub on *privatus privatus*; as I have still lived so I now continue, *statu quo prius*, left to a solitary life and mine own domestic discontents; saying that sometimes, *ne quid mentiar*, as Diogenes went into the city, and Democritus to the haven, to see fashions, I did, for my recreation, now and then walk abroad, look into the world, and could not chuse but make some little observation; *non tam sagax observator ac simplex recitator*, not as they did, to laugh at all, but with a mixed passion,' Bishop Kennet says, in his *Register and Chronicle*, p. 320, 'In an interval of vapours he would be extremely pleasant, and raise laughter in any company; yet I have heard that nothing else would make him laugh but going down to the bridge foot in Oxford, and hearing the barge-men scold, storm, and swear at one another, at which he would set his hands to his sides and laugh most profusely; yet in his college and chamber so mute and morose that he was suspected to be *felix de se*.'

We give the title, which contains an analysis, of his work.

at length. 'The Anatomy of Melancholy: what it is; with all the kinds, causes, symptoms, prognosticks, and severall cures of it. In three maine partitions, with their severall sections, members, and subsections. Philosophically, mediocrally, historically opened and cut up. By Democritus Junior. With a satyricall Preface, conducing to the following Discourse. Macrobi. *Omne meum; nihil meum.*' In defence of this title he says, 'It is a kind of policy in these days to prefix a fantastical title to a book which is to be sold; for as larks come down to a day-net, many vain readers will tarry and stand gazing.' The name of Democritus Junior is introduced in the inscription on his monument in Christchurch cathedral: on which the calculation of his nativity was also engraved. A plate of it is given in Nichols's 'History of Leicester,' vol. iii. p. 418, from which, together with the *Athenæ Oxonienses*, this article is compiled. The 'Anatomy,' &c. at first was very popular, and went through five editions before the author's death. Towards the close of the 17th century it fell into oblivion, and was seldom seen except on the book-stalls, until brought into notice by Johnson (who said that it was the only book that ever took him out of bed two hours sooner than he wished to rise), Warton, and others. Mr. Steevens in his own copy noted a rise in price, within a few years, from eighteen pence to a guinea and a half. Since that time one edition at least has been published. Sterne was largely indebted to Burton's peculiar humour, though he never acknowledged it: many even of his stories are copied word for word from the 'Anatomy of Melancholy'—this Dr. Ferriar has fully shown in his 'Illustrations of Sterne,' 1798. The 'Anatomy of Melancholy' displays that extent and variety of reading to which Sterne was a pretender; it is termed a *cento* by its author, and consists chiefly of an immense mass of quotations, bearing on a great variety of subjects, some very little connected with the main topic of the work. Warton speaks of it in the following terms. 'The writer's variety of learning, his quotations from scarce and curious books, his pedantry sparkling with rude wit and shapeless elegance, miscellaneous matter, intermixture of agreeable tales and illustrations, and perhaps, above all, the singularities of his feelings clothed in an uncommon quaintness of style, have contributed to render it, even to modern readers, a valuable repository of amusement and information.' (Milton's *Minor Poems*, p. 93.)

Not to be confounded with the above is the author of a number of cheap books published about the beginning of the 18th century, with the name of Robert Burton in the title-page. (See Chalmers's *Biog. Dict.*)

BURTON-IN-KENDAL. [WESTMORELAND.]

BURTON-UPON-TRENT, a market-town in the hundred of North Offlow, on the Trent, in Staffordshire, 22 miles E. from Stafford, and 109 N.W. from London. The parish of Burton-upon-Trent is partly in Staffordshire and partly in Derbyshire; it is in the diocese of Lichfield and Coventry; the average gross annual income of the living is stated at 1927. The area of the parish is 9030 acres, with, in 1831, 6988 inhabitants. The town, though usually called a borough, is not incorporated. On the dissolution of the monasteries, Henry VIII. granted to an ancestor of the marquis of Anglesey, the present lord of the manor, the manor of Burton-upon-Trent, including the town and several hamlets, which formed part of the possessions of the Abbey of Burton, together with various privileges which had been enjoyed by the abbots. By virtue of this grant, the lord of the manor appoints a steward and bailiff, who hold their offices during his pleasure. The bailiff has the management of the police and the general regulation of the town, except as to paving and lighting, which is vested in commissioners under a local act.

The abbey of Burton was founded in the beginning of the eleventh century by an earl of Mercia, and it received charters and immunities from several kings. Some of the abbots sat in parliament. There are scarcely any remains of the once extensive buildings of this abbey. The most remarkable object connected with the town is the bridge, which is of considerable antiquity, and is the longest bridge in England. It has thirty-six arches, and is 1545 feet in length. The bridge connects at this place the counties of Stafford and Derby, and towards the middle of it is the legal boundary.

Leland states that in his time Burton was noted for its alabaster works. How long these works continued to flourish is unknown. Alabaster is found in the neighbourhood of Needwood Forest. Burton has long been, and still

is, celebrated for its ale, which constitutes the chief manufacture of the place. The town consists of two principal streets, one running parallel to the river, and another cutting it at right angles. The market-day is Thursday; there are four annual fairs, one of which lasts five days. The Education Returns of 1835 state that there are nineteen daily schools, and six Sunday schools in the parish. The free grammar-school was founded and endowed in 1520 by the then abbot of Burton. Considerable estates for charitable and other purposes for the benefit of the town are vested in trustees. The grand Trunk Canal, which is called also the Trent and Mersey Canal, passes Burton, and communicates with the Trent about a mile below the town. The Trent, which falls into the Humber, is navigable for barges up to Burton-upon-Trent. (Gough's *Camden*; Shaw's *Staffordshire*; *Beauties of England and Wales*; *Municipal Corporations Report*; *Pop., &c., and Educ. Returns.*)

BURTSCHIED, BORSCHIED, or BORCETTE.
[AIX-LA-CHAPELLE.]

BURY, a m. t. in the co. palatine of Lancaster, made a bor. in 1832 under the Reform Act, with the privilege of sending one member to parliament. It is 195 in. N.N.W. of London, 9 N.N.W. of Manchester, 6 E.N.E. of Bolton, 7 W.S.W. of Rochdale, 16 S.E. of Blackburn, 9 S. of Haslingden, and 48 S.E. by S. of Lancaster.

The par. comprises the town of Bury, the t. of Elton and Walmersley, including Shuttleworth, and the chapelrys of Higher Tottington and Lower Tottington, and Heap, including Heywood, all in the hund. of Salford; and the t. of Coupe-Lench-cum-Newhall Ley-cum-Hall Carr, Henheads, and Musbury in the hund. of Blackburn. The pop. of the par. has more than doubled since 1801, as the following table will show:—

	1801.	1811.	1821.	1831.
Bury t.	7,072	8,762	10,583	15,086
Coupe Lench, New Hall Hey- cum-Hall Carr, t.	676	786	1,294	1,519
Elton t.	2,080	2,540	2,897	4,054
Heap-cum-Heywood chap.	4,283	5,148	6,552	10,429
Musbury t.	463	589	728	1,231
Tottington (Higher) chap.	1,246	1,556	1,728	2,572
Tottington (Lower) chap.	4,314	5,917	7,333	9,280
Walmersley and Shuttleworth t.	2,166	2,619	3,290	3,456
Total	22,300	27,917	34,335	47,627

The annual value of the par. presents a still greater proportionate augmentation during the period of which we have returns, viz.:—

	1815.	1829.
Bury	16,546	34,954
Coupe-Lench, &c.	8,627	2,494
Elton	6,370	11,178
Heap, &c.	8,861	27,820
Musbury	1,299	2,379
Tottington (Higher)	4,366	6,583
Tottington (Lower)	9,011	16,813
Walmersley	5,822	7,770

Total . . . £60,902 £109,993

The town of Bury has been very much enlarged and improved within the last few years. The streets are now lighted with gas; and more attention is paid than formerly to the paving and cleansing of the streets. There are no waterworks, but the inhabitants are well supplied with water by means of pumps. Though the town stands on rising ground, it seems relatively low, from the hills which surround it on the N. and E. The river Irwell, which does not take this name till it reaches Bury, flows through the W. end of the town, and is joined by the Roche about two miles to the S. In antient times one of the twelve baronial castles of the county stood close to this town, not far from the parish church, on the banks of what was then the course of the Irwell; but the river now takes a more N.W. course, and leaves a fertile tract of land in the valley between its present and its antient bed. The time and the cause of this change are not known. It has been conjectured to be owing to the works of the bomiegers in 1644, when the town was attacked by the parliamentary troops, and the ruins of the castle were entirely demolished. Nothing now remains to mark the former existence of this fortress but fragments of stone, which are occasionally dug out of its antient foundations. In Leland's time part of the ruins remained, as he alludes to them in his description of the place. 'Byri on Irwel water, four or five miles from Manchester, but a poore market. There is a ruine of a castel by the paroch church yn the towne. It longgid with the towne sumtime

to the Pilkingtons, now to the Eries of Darby. The place where it stood is still called Castle Croft, from which may be seen Castle Stedda, the name of the spot, in the adjoining township of Walmerley, where the besiegers threw up an intrenchment which enabled them to effect their purpose of battering down the walls of the castle. The name of the town has its origin, according to some antiquaries, from this feudal building, *Byri* signifying, in Saxon, a castle or fortified place. According to other authorities, Bury was a Roman station, in the vicinity of *Coccium*, if not that celebrated place itself; but this opinion is now generally allowed to be unsupported both by geographical and antiquarian evidence, no remains of Roman antiquity having been discovered in the town or immediate neighbourhood.

The history of the manor of Bury is unknown prior to the reign of Henry II. It was then, along with some adjoining manors, according to the Townley MSS., in the possession of John de Lacy. The family of Henry de Bury afterwards became the owners of the lordship of Bury; and they were succeeded by the Pilkingtons, a family of note, whose residence, in Leland's time, was about three miles distant from Bury, at Pilkington Park. It remained in the possession of the Pilkington family until, by the attainder of Sir Thomas Pilkington, in the reign of Henry VII., his estates being confiscated and given to the Stanleys, the manor went along with them. Since that time the manorial rights have belonged to the Earl of Derby.

The population of Bury was no doubt originally composed of such persons as were required near a baronial residence of such importance as the castle above described. In process of time, as the feudal baronies decayed, new settlers introduced new occupations, and in this manner the manufacture of woollen cloth became a staple article of trade in this place, so far back as the fourteenth century, and flourished to such an extent that in the reign of Elizabeth one of her aulnagers was stationed in the town to stamp the cloth. Up to a much later date than this, woollens were almost the sole manufacture of the place; but upon the introduction of the cotton trade into the county many of the inhabitants became weavers of cotton fabrics, and the woollen trade has been gradually retiring into Yorkshire and other parts of the country where the cotton manufacture is less paramount. The number however still employed in this town in manufacturing flannel, baize, blankets, coating, &c. is estimated at 4000.

But a still larger proportion of the population are engaged in the different branches of the cotton trade, which, owing to the vicinity of Bury to the Manchester market, and the abundant supply of coal and water, are carried on to a considerable and increasing extent in this and the adjoining township. The mills for the spinning of cotton are large and numerous, and employ a great number of the inhabitants.

Several important improvements in the cotton manufacture took their rise in this place. A new method of throwing the shuttle by means of the *picking-peg* instead of the hand, and thence called the fly shuttle, was invented by John Kay, a native of the town; and in 1760 his son, Robert Kay, invented the drop-box, by means of which the weaver can at will use any one of three shuttles,—an invention which led to the introduction of various colours into the same fabric, and made it almost as easy to produce a fabric consisting of different colours as a common cloth of only one. Bury is indebted for one branch of its present trade to the late Sir Robert Peel, who established his extensive print works on the banks of the Irwell, near this town. He resided at Chamber Hall, in the immediate vicinity, where the present Sir Robert was born. Besides these different branches of the cotton and woollen manufacture, there are extensive bleaching-grounds and iron-foundries. The manufacture of hats and hat-bodies is also carried on to a considerable extent.

A branch of the Manchester, Bolton, and Bury canal, constructed under an act of parliament in 1761, furnishes a ready communication by means of a packet-boat with those places, as well as by the common boats for *tenage* to all parts of the kingdom. There is no lock on this canal between Bury and Bolton; but the fall into the river Irwell at Manchester is 95 ft.

The public officers of the town consist of three constables, who are appointed at a court-leet held at Whitsuntide, which is summoned by the agent of the Earl of Derby: a deputy constable, who holds his office for life, acts under these

officers. Two other court-leets are held in April and October, under the same nobleman, for the nomination of a court barge which is held every third week for the recovery of debts under 40s. The jurisdiction of all these officers extends over the whole parish. Petty sessions for the division are held weekly. There is a weekly market on Saturday, which is well supplied; but that which was formerly held, according to the charter, on Thursday, has been long discontinued. The three annual fairs are held on March 5th, May 3rd, and September 18th.

The living of Bury is a rectory in the deanery of Manchester, and in the archdeaconry and diocese of Chester, returned in 1835 as of the net annual value of 1937*l.*, of which the Earl of Derby is patron. The value of the living was very considerably augmented by an act of parliament passed in 1764, empowering the rector for the time being to grant building-leases of the glebe land for ninety-nine years, renewable at any period in the interim. The glebe land occupies nearly one-half of the town. The church to which this living belongs is dedicated to St. Mary. It was formerly a Gothic structure; but in 1776 it was rebuilt, all but the steeple, and in a different style of architecture, as it is probable that the steeple, which has a short spire upon it, was of more recent date than the ancient edifice. St. John's chapel, in Stanley Street, erected in 1770, is a neat building in the patronage of the rector, who has also the presentation to all the episcopal chapels in the parish. The living of St. John's is a perpetual curacy, endowed with 600*l.* of private benefaction, 400*l.* royal bounty, and 1500*l.* parliamentary grant.

The Dissenting places of worship in the town are numerous. The oldest is the Presbyterian chapel in Silver Street, belonging to the Unitarians, which, during a period of 105 years after it was erected, had only three ministers. The Independents have two chapels, one in the New Road, erected in 1792, and the other called Bethel Chapel, in Henry Street, erected in 1807. The Methodists of the new connexion, the Wesleyans, and the Primitive Methodists have separate meeting-houses. The Roman Catholics have also a chapel.

To all the churches and chapels are attached Sunday-schools, which afford instruction to 4224 children. In connexion with the Established Church 1013 are educated; Independents, 900; Methodists, 1304; Unitarians, 330; Roman Catholics, 155; and in factory schools, 522. (*Report of Statistical Society in Bury.*)

The public charities and institutions in Bury consist of a free grammar-school, a good building near the church. This school was founded in 1726, by the Rev. Roger Kay, and endowed with estates which now yield a revenue of 438*l.* 15*s.* 3*d.* It is divided under two masters into two schools, the upper and lower. In the upper school, besides a number of boarders which the head master is allowed to take, about twenty boys are educated on the foundation; and fifty boys in the lower school. The course of instruction in the upper school is classical and mathematical, no boy being admitted who is not competent to commence reading an easy Latin author. Before admission into the lower school, the boys are required to read well, and they are taught, in addition to reading, writing, and accounts, English grammar, geography, and English history; and if a boy intends to advance to the upper school, he is taught the Latin grammar; but very few boys go to the upper from the lower school. The terms in the upper school are 5*s.* on entrance, and 5*s.* at Shrovetide, Midsummer, and Christmas. Half this sum is paid by the boys in the lower school. There are two annual exhibitions on this foundation for seven years to either of the two universities. The management of the school is vested in thirteen trustees, seven of whom must be beneficed clergymen residing within ten miles of the town, and six laymen.

A charity-school for the instruction of eighty boys and thirty girls was founded in 1748, by the Hon. and Rev. John Stanley, formerly rector. In 1815, the funds of the charity having been much augmented by annual subscriptions, it was converted into a national school; and a spacious building was erected, two stories in height, the upper room being used for girls, and the lower room for boys. It now provides for the education of 260 children, of which number about sixty of the boys and forty of the girls are clothed in pursuance of the will of the founder. There are two infant schools, containing 240 children, chiefly supported by the weekly contributions of twopence each.

A dispensary and lying-in charity are supported by annual subscriptions. There are several small charities for the distribution of linen cloth among the poor of the town of Bury, viz. Guest's charity, 10s. a-year; Banks's charity, 3l. a-year; Rothwell's charity, 10s. a-year; and Waring's charity, 1l. 1s. a-year. Besides these, Shepherd's charity furnishes 9l. for annual distribution among the poor; and Yates's charity 16l. 3s. for the relief of aged persons.

There are also other charities belonging to the parish, which altogether form only a small amount.

A savings' bank was established in Bury in 1822. There is a public subscription library, a news room, a mechanics' library, a medical library, and a billiard room.

BURY ST. EDMUND'S, a borough and market-town, having separate jurisdiction, locally situated in the hundred of Thungoe, in the western division of the county of Suffolk, 25 miles N.W. by W. from Ipswich, and 72 miles N.E. by N. from London. The borough contains 3040 English statute acres, and is co-extensive with the two parishes of St. James and St. Mary.

Origin and early History.—The origin of Bury St. Edmund's, or St. Edmund's Bury, as it is called by old writers, has been a subject of much discussion. Some say it was the Villa Faustina of the Romans, mentioned in the itinerary of Antoninus, and that it owed its name to Faustinus, or to Faustina, the wife of the Emperor Antoninus Pius; others say it derived its name from *faustus* (prosperous, happy), and so signified the 'happy town.' It is at least certain, from the number of Roman antiquities dug up in the neighbourhood, that it was at one time in the possession of that people. At the time of the dissolution of the Heptarchy, it belonged to Beodric, and was hence called Beodric's-worthe or Beoderic-cortis, the villa or mansion of Beodric. Dr. Yates, in his 'History of the Town and Abbey of Bury St. Edmund's,' endeavours to derive its latter name from two Saxon words meaning a place dedicated to religious worship; but the former derivation is more natural (as it actually belonged to Beodric), and therefore more satisfactory. Beodric bequeathed it to Edmund the king and martyr, after whom it was called St. Edmunda's Bury—Bury, like Ben, burg, burgh, &c., being a Saxon word meaning castle or strong town.

Edmund, having succeeded to the throne of East Anglia, was crowned at Bury on Christmas-day, 856, and in the 15th year of his age. In 870 he was taken prisoner and cruelly put to death by the Danes. The following is the fabulous history given of the circumstances attending his death, to which tradition the corporation owes the devices on its arms and seal. St. Edmund, being a Christian as well as an enemy, was first scourged and then bound to a tree and his body pierced with arrows. His head was then cut off and thrown into a neighbouring wood. On the departure of the Danes, the East Anglians assembled to pay the last solemn tribute of affection to their martyred king. The body was found bound to the tree, and was interred in a wooden chapel at Hoxue; but no where could they find the head. At last, after a search of forty days, the head was discovered between the fore paws of a wolf, which immediately resigned its charge unmutated, and quietly retired into the wood. 'An unkonouth thyng,' says Iydgate, 'and strange ageyn nature.' The head, on being placed in contact with the trunk (which was not the least decomposed), is said to have united with it so closely that the separation was scarcely visible.

Monastery, Antiquities, &c.—Soon after the martyrdom of King Edmund, six priests devoted themselves to a monastic life under the patronage of the royal saint, and founded a monastery, which, in after ages, by the magnificence of its buildings, the splendour of its decorations, its valuable immunities and privileges, outshone any other ecclesiastical establishment in Great Britain, Glastonbury (in Somersetshire) alone excepted. Leland, who saw the abbey probably when in its highest state of perfection, thus describes it: 'The sun hath not shone on a town more delightfully situated, with a small river flowing on the eastern part, or a monastery more illustrious, whether we consider its wealth, its extent, or its incomparable magnificence. You might indeed say that the monastery itself is a town; so many gates there are, so many towers, and a church than which none can be more magnificent; and subservient to which are three others, also splendidly adorned with admirable workmanship, and standing in one and the same churchyard.'

Amongst the first benefactors of the monastery were King Athelstan and Edmund, son of King Edward the Elder. The latter conferred on it many valuable privileges, which he confirmed by royal charter. Previous to the destruction of Bury by Swein in the beginning of the 11th century, Ailwin, who had been appointed to the high office of 'guardian of the body of St. Edmund,' feared lest the Dane should get possession of the holy relic, conveyed the remains to London. The bishop of that see clandestinely took possession of the precious relic, and refused to return it; but after some altercation, it was carried back by Ailwin, then bishop of Hulme, and placed in the abbey church of Bury.

In 1020 Ailwin ejected all the secular clergy from Bury, and established twelve Benedictine monks from the monastery of Hulme in the abbey, exempted them from all episcopal authority, and laid the foundation of a beautiful church, which was consecrated in 1032. The three first churches were built of wood, but in the year 1065 another was erected of hewn stone, under the auspices of Abbot Baldwin. It took twelve years building, and was embellished by numerous ornaments brought from Caen, in Normandy. It was 505 feet in length; the transept was 212 feet, and the western front 240 in breadth; altogether it contained twelve chapels. Part of the ruins of the western front still remain. One of the towers, which seems to bid defiance to time or weather, has been converted into a stable; and the three arches, which once formed the entrance to the three aisles of the church, have been filled up with modern brick-work, and now form convenient dwelling-houses.

There appear to have been four grand gates to the abbey, and its lofty embattled walls inclosed within its vast circumference the body of the monastery, the abbot's palace, the garden, &c., chapter-house, towers, cloisters, infirmaries, the magnificent monastical church, an extensive churchyard, three smaller churches, and several chapels. The abbey contained 80 monks, 16 chaplains, and 111 servants; besides the abbot, who was a spiritual parliamentary baron, held a synod in his own chapter-house, and appointed the parochial clergy of the place. He inflicted capital punishment, and had the power to try by his steward all causes within the liberty of Bury. Beyond the circuit of the abbey walls were several hospitals and chapels under the patronage and protection of the monks. As a proof of the despotic power possessed by the abbot and his monks, it is sufficient to mention that in the 13th century some Franciscan friars came to settle at Bury, and built a handsome monastery; but the monks of Bury pulled it down, and drove the friars out of the town with impunity. Edward the Confessor granted to the abbot the liberty of coining, and Edward I. and Edward II. both had mints here. Some pennies coined at Bury still exist in the cabinets of antiquaries. Henry I., on his return to England after his interview with pope Innocent III., came to Bury to pay his devotions to the shrine of St. Edmund. During the contests which took place between Henry II. and his son, a large army was assembled at Bury in support of the king. The rival armies met at Fornham St. Genevieve (a place in the neighbourhood), on the 27th of October, 1173; and the victory, which was obtained by the royalists, was chiefly attributed to their carrying before them the sacred standard of St. Edmund. Richard I. paid a devotional visit to the shrine of the saint on his return from the Holy Land, and presented to the monastery the rich standard of Isaac, king of Cyprus. It was here also that John was first met by the refractory barons, when he was compelled to sign Magna Charta. In 1272 Henry III. held a parliament at Bury. A parliament was also held here by Edward I. in 1296, when all the goods and chattels and all the revenues of the monastery were forfeited to the king, upon the monks refusing to pay a subsidy that was demanded from them; but on their afterwards complying, their goods were restored. In 1446 a parliament was convened for the purpose, as is supposed, of effecting the death of Humphrey, duke of Gloucester. Henry VII. and Elizabeth both visited Bury, and were entertained here with considerable pomp and magnificence.

This celebrated monastery was 519 years in the possession of the Benedictine monks, and during that time had 33 abbots. At the dissolution of monasteries it was valued by the commissioners at 2366l. 16s., but that must have been considerably under its real value, for the commissioners, in their report, say, 'we have taken in the seyd monas-

tery in gold and silver 5000 marks; besides as well and rich cross with emeralds and also divers stones of great value, and yet we have left the church, abbey, and convent, very well furnished with plate of silver necessary for the same.' A writer in 1725 says that at that time the immense possessions of the abbey and its valuable privileges would have been worth 200,000*l.* per annum.

Almost the only relic which remains of the magnificence of this monastic establishment is the western, now called the abbey gate. It was erected in 1327, after the old gate was pulled down by the mob. It is a perfect specimen of Gothic architecture, combining strength and utility with elegance and grandeur. The materials and workmanship are both so excellent that, although without a roof, it is still in the highest state of preservation. Its height is 62 feet, its length 50 feet, and breadth 41 feet. In the N.W. and S.W. angles were circular stairs; those on the S.W. side still exist, but are rather difficult to ascend. The 'terrace-plains' of the wall forms a terrace all round, and over each angle there formerly was a tower.

The eastern side of this gate, although not so gorgeously splendid as the west side, is the more elegant. The internal walls are beautifully decorated, and amongst other carved work are the arms of King Edward the Confessor. Amongst other antiquities found in digging up an old foundation are four antique heads, cut out of blocks of freestone of gigantic dimensions, and probably representing some heathen deities.

Various ruins of religious and charitable institutions connected with the abbey are still visible. The following are mentioned in Dugdale's 'Monasticon':—The Hospital of St. John or God's-house without the south gate, probably the chapel, or as it is sometimes called the Hospital of St. Petronilla, was connected with this house; St. Nicholas' Hospital without the east gate, now a farm-house; St. Peter's Hospital and Chapel, founded by Abbot Anselm, in the time of Henry I., now belonging to the trustees of the free grammar school: its revenue at the dissolution was worth 10*l.* 18*s.* 11*d.* St. Saviour's Hospital, founded by Abbot Sampson in the reign of King John: it was here that the duke of Gloucester is supposed to have been murdered. St. Stephen's Hospital, Jesus' College and Guild, erected by King Edward VI. in 1481, now occupied as a workhouse; and, lastly, the convent of Grey Friars at Babwell or North Gate, established in 1256.

The Saxon Tower, or Church Gate.—This noble structure was the grand portal into the churchyard opposite to

the western entrance of the monasterial church. At the dissolution it was converted into a belfry for St. James's Church, and to this circumstance, says Mr. Yates, 'most probably the antiquarian is indebted for the gratification of now surveying this venerable relic of ancient piety and taste.' It is considered one of the finest specimens in existence of what is called Saxon architecture. It is a quadrangular building 80 feet high, and is remarkable for its strength and simplicity. The date of its erection is unknown. The stone of which it is built abounds with small shells. Near the base on the western side are two curious bas-reliefs, one representing mankind in its fallen state, by the figures of Adam and Eve entwined with a serpent, and the other, emblematic of the delivery of man from bondage, representing God the father sitting triumphantly in a circle of cherubim. The interior of the arch presents some grotesque figures, and forms a carriage-entrance to the churchyard and the shire-house. We regret to say that several wide fissures appear on one side, and the other it is said is 12 inches out of the perpendicular. [The drawing presents a view of the west side.]

Town Government, &c.—Bury is a borough by prescription, and its prescriptive rights were first confirmed by James I. in the fourth year of his reign.

The exclusive criminal jurisdiction over the whole town and one mile round it, which was granted to the abbot of Bury by Edmund, son of Edward the Elder, and is now vested in the corporation, ceases under the Municipal Corporation Act from the 1st of May, 1836. The borough courts are a court of sessions, a civil court called the court of record, a court-leet, and a court of Pie-poudre. The sessions are held three times a year, in February, June, and November, and as the county assizes are held within the town there are annually five gaol deliveries. Petty sessions are held every Thursday, and are very well attended by the magistrates. The court of record is held once a month, and embraces all pleas where the cause of action has arisen within the precincts of the borough and the damages do not exceed 200*l.*

A court-leet is held once a year. There is also the court of the steward of the liberty, called the 'Much Court,' which is held once in every three weeks before the town-clerk, but which is limited to debts under 40*s.* The town is watched by night, and has an efficient police. The borough gaol has not been used since 1805. The prisoners are all confined in the county gaol which is within the precincts of the town. The property of the corporation is worth about 1016*l.* per annum, out of which they have to pay crown rents to the amount of about 58*l.* 6*s.* 6*d.* per annum, and 9*l.* 4*s.* two charities. Bury first received a precept to return representatives to parliament in the 30th year of the reign of Edward I., but made no subsequent return till the 4th of James I., since which time it has always returned two members. The number of voters registered after the passing of the Reform Act was as follows:—

Householders	560
Burgesses	30
	590

The boundaries of the borough are the same as they were formerly.

Present state of the Town, Churches, &c.—The town of Bury is pleasantly situated on the river Larke, and from its delightful walks, clean streets, and well built houses, and from the urbanity of its inhabitants, forms as pleasant a country residence as any small town we know of. A great part of the town was burnt down in 1806, but was shortly after rebuilt in its present regular manner. There is a subscription library, which contains a valuable collection of books, and four circulating libraries. The new subscription rooms on Angel Hill are very handsome and contain a well-proportioned ball-room, card-rooms, billiard-room, &c. There is also a subscription coffee-room and billiard room. A new theatre was built in 1819, and the old one has been converted into a concert-room. The entrance to the botanic garden is through the abbey gate, and the walls that surround it are part of the old walls of the monastery. The river Larke flows at the bottom of the garden. The collection of exotic plants, which is already pretty good, is rapidly increasing.

St. Mary's Church was begun in the year 1424, and was completed in about nine years; it is 130 feet long, exclusive of the chancel, which is 74 feet by 68 and 67½ in breadth. It has three aisles, which are divided by two rows of the

[Saxon Tower, Bury.]

most elegant columns. The height of the middle aisle is 60 feet, to which circumstance its beautifully carved roof owes its present existence, it being too lofty for the Puritans to exercise their fury on. The roof of the chancel is exceedingly beautiful, the ground being blue and the carved work gilt; it is supposed to have been brought from Caen in Normandy. On the north side of the communion table is a marble slab erected to the memory of Mary Tudor, third daughter of King Henry VII. of England, who first married Louis XII. of France and subsequently Charles Brandon duke of Suffolk. The monument which inclosed the body was for some time supposed to be only a cenotaph, but in opening it, in 1731, a covering of lead containing a body was found with the following inscription upon it:—

MARY QUEENE
1533.
OF FRANCE.
EDMUND H.

In the middle of the chancel lies buried John Reeves, the last abbot of Bury, and on each side is a handsome altar-monument: one to Sir William Carew, who died in 1501, and his wife who died in 1525; and the other to Sir Robert Drury.

The church is surmounted by a fine Norman tower, containing a very good set of bells. The northern porch is handsome, and the exterior of the southern aisle is particularly beautiful.

St. James's Church, like *St. Mary's*, is built of freestone, and is a very handsome building. It was not completed till the Reformation, when Edward VI. gave 200*l.* towards its completion. Its length is 137 feet, and its breadth 69 feet. Near the western door are two handsome monuments, one to the Right Honourable James Reynolds (Chief Baron of the Exchequer), who died in the year 1738, and another to Mary, his wife, who died in 1736. Both the livings are in the patronage of the corporation of Bury. The net income of *St. Mary's* is 110*l.* per annum; that of *St. James's* 106*l.* per annum.

The Churchyard is of considerable dimensions, and has a beautiful avenue of lofty lime-trees. It contains both churches, the Saxon tower, abbey ruins, Clopton's hospital, the shire-house, and the mausoleum; the latter was formerly 'the Chapel of the Charnel,' where it is said Lydgate the poet resided. Not many years since it formed the residence and workshop of a blacksmith. It is surrounded by shrubs, and forms an interesting object from the number of tombs grouped together.

The Shire Hall, a neat modern building, is situated on the ancient site of *St. Margaret's* church, and contains two good-sized courts, which have but one inconvenience, that is, having no internal communication. The Guild-hall, where the borough-courts are held, is a handsome structure, built of flint and freestone.

The County Gaol, about half a mile from the south end of the town, is built on the radiating principle, and is surrounded by a wall twenty feet high, inclosing an octagonal area, the diameter of which is 292 feet. The keeper's house, which is an octagon and stands in the centre, is so elevated above the rest that from his windows he can command the whole building. In the centre of his house is a chapel, divided off into numerous partitions, so that the different classes into which the prisoners are divided and subdivided are kept separate and cannot even see each other. Upon the whole, for its accommodations and internal regulations, this gaol is one of the best in the kingdom. Two tread-mills have lately been added to it. The house of correction is near the gaol, and is equally well managed, being under the superintendence of the same keeper. It at present only contains female prisoners, all the men being confined in the gaol.

Part of the town is well paved, but the principal streets are macadamized. It is well lighted, and has a sufficient supply of water. About a mile from the town the river Lark becomes navigable to Lynn, whence coals and other commodities are brought in small barges. The market-days are Wednesday and Saturday; the latter for meat and poultry, the former for corn, &c. Fairs are held on the Tuesday in Easter week, and on the 1st of October and 1st of December, for horses, cattle, cheese, &c. But the great fair, which is justly celebrated, generally commences about the 10th of October, and lasts about three weeks.

Bury St. Edmund's contains 2292 houses, of which 2231

are inhabited. The population in 1831 was 12,486, out of which 6190 were females. There are 2492 families, nearly all engaged in agriculture and retail trade. The assessed taxes are 4994*l.*

The Grammar-school, which is a neat modern building, with a commodious house adjoining it for the master, was founded by King Edward VI., whose bust is placed over the door with an appropriate inscription. It has four exhibitions of 20*l.* each, and two of 25*l.* each per annum, to either of the universities, a scholarship at Corpus Christi, and another at Jesus-college, Cambridge. A new school-house has lately been erected. There are now about 100 boys on the foundation.

Bury also possesses three charity-schools, in one of which forty boys, and in another fifty girls are instructed and clothed. They are supported partly by subscription and partly by an endowment of 70*l.* per annum, as well as two Lancelotian schools, one for boys, the other for girls, established in 1811; and 38 almshouses, founded by different persons, amongst whom the principal benefactors were Mr. Edmund King and Mrs. Margaret Drury. They are under the superintendence of trustees, and their funds altogether amount to about 2000*l.* per annum. Boley Clopton, M.D., founded an hospital (called Clopton, after the founder) for the support of six aged widowers and widows, and endowed it with property worth 200*l.* per annum. It is a neat brick building, with the arms of the founder over the principal entrance. A large erection, built by the government for an ordnance depot, has been purchased and converted into a general hospital, which is supported by voluntary contributions, and now contains about forty patients.

There is a Roman Catholic chapel, a place of worship for Baptists, the society of Friends, Methodists, and Unitarians, and two for Independents. A mechanics' institute has recently been established.

Amongst other men of note who were born at Bury St. Edmund's was Bishop Gardner. John Lydgate, commonly called 'the Monk of Bury,' spent the greatest part of his life in this place.

About three miles from Bury is Ickworth, the magnificent seat of the marquess of Bristol. It is a circular house, 140 feet in height and 90 feet in diameter, in the centre of a park which has a circuit of 11 miles. (*Communication from Bury.*)

BUSACO, SERRA DE, a mountain-ridge in the province of Beira in Portugal, stretching from the right or N. bank of the Mondego in a N. direction for about 8 miles. It joins at its N. end the Serra de Caramula, an offset of the great Serra de Alcoba, which runs in a N.E. direction, and divides the waters of the Vouga from those of the Mondego. The road from Viseu to Coimbra passes over the Serra de Busaco. The sides of the mountain are very steep, and partly covered with woods; the summit is a naked plateau, from which there is an extensive view over the country around, and to the W. as far as the sea. On the highest point of the Serra is a convent of monks. A battle was fought on the 27th September, 1810, at Busaco between the English and Portuguese on one side and the French on the other. The French army, 65,000 strong, under Marshal Massena, advanced by Viseu and the right bank of the Mondego towards Coimbra. Lord Wellington, with about 20,000 British and as many Portuguese troops, took up a position on the Serra de Busaco. The French advanced in three columns, one of which succeeded in reaching the summit of the hill, but while in the act of deploying was charged by some English regiments and driven down the hill with great loss. The other two columns were likewise unsuccessful. The French had about 4000 men killed, wounded, and taken prisoners, and they lost the eagle of one of their regiments; one of their generals was killed, and another taken prisoner. The loss of the allies was about 1300. Marshal Massena, unable to force the position of Busaco, turned a mountain-pass over the Serra de Caramula, which a troops to Sardo in the plains of and on the high road from Oporto

to Coimbra. L. then withdrew his army to the S. of the M. and began his retreat to the lines of Torres Vedras. In the 1st of October the French entered Coimbra, which had been deserted by its inhabitants. It was at the battle of Busaco that the Portuguese troops, recently drilled and disciplined by British officers, were first placed in line by the side of the English, and the result of the experiment proved most favourable. (Colonel

Napier's History of the Peninsular War; Annals of the Peninsular Campaigns.

BUSBEQUIUS, A. G., a celebrated traveller and ambassador of the 16th century. His real name was Auger Gisleen de Busbec, which, according to the practice of his age and country, was Latinized into Augerius Gislelinus Busbequius. He was born at Commines, a town in Flanders, on the river Eys, and was the illegitimate son of the lord of Busbec, a gentleman of ancient family, who brought him up in his own house, and spared no care or expense in his education. The boy made such rapid progress in his studies; and his disposition, person, and abilities, were so promising, that his father became very fond of him, and was induced to apply to his sovereign, the great emperor Charles V., for a rescript of legitimacy in his favour. The rescript, which declared young Busbequius as good as one born in wedlock, was obtained in the usual manner, by paying a round sum of money for it. When he grew up, Busbequius was sent to study in the best schools and universities on the continent—to Louvain, Paris, Venice, Bologna, and Padua, at which several places he associated with the most learned professors and distinguished men of his times. Having finished his academical studies and returned from Italy, he visited London, where he passed some time with Don Pedro Lasso, ambassador at the English court from Ferdinand, then titular king of the Romans, but shortly afterwards Ferdinand I., Emperor of Germany. Busbequius probably joined Don Pedro with the view of learning some of the routine and practical parts of diplomacy, and was what we now call an *attaché* to the embassy. During his stay in England he was present as one of the ambassador's suite at the solemnization of the marriage between Philip II. of Spain and Queen Mary of England, in 1554. Shortly after this he returned to Flanders. His reputation for ability, knowledge, and experience in public affairs stood so high, and his friends at the court of Vienna were so influential, that on the 3rd of November of the same year he received a letter from Ferdinand, advising him that he was destined for the important post of ambassador to Constantinople, and that he must begin his journey immediately. Busbequius accordingly mounted on horseback (for there was then no other mode of making the journey), and rode from Brussels to Vienna through very bad weather and detestable roads. Having received his dispatches and instructions from King Ferdinand, he set out with boldness and alacrity for Constantinople, although the circumstances of the case would have been sufficient to deter most persons. The Turks were then at the height of their power, intolerance, and insolence; they had conquered Transylvania, and nearly all Hungary; they were within a few days' march of Vienna, where their mere name spread terror; and the reigning Sultan, Solymán the Great, or Magnificent, was fierce and unrelenting, and accustomed to treat the envoys of Christian powers who did not please him in a very summary manner. On arriving at Constantinople, he found that the sultan was with his army at Amasia, in the interior of Asia Minor. As his commissions did not permit delay, he crossed over into Asia, and rode on to Amasia, where he staid a considerable time, and had several audiences of the Great Solymán, with whom he succeeded in concluding or rather prolonging a truce for six months. He rode back to Vienna, where he arrived in August, 1555.

In November of the same year he was again sent as ambassador to Constantinople. This time Solymán was at his capital, where Busbequius took up his residence for nearly seven years. At first he had many difficulties to encounter from the pride and obstinacy of the Turks: 'For you must know,' he says in one of his epistles, 'that a long series of happy success hath so elevated the minds of this people, that they make their own wills, forsooth, the sole rule of all reason, right or wrong.' But Busbequius showed admirable tact and temper, and at the end of his long mission concluded an advantageous treaty with Solymán.

In 1562 he returned to Vienna, and was soon after appointed governor and tutor to the son of Maximilian, then king of the Romans. Though attached to the pleasures of private life and literary ease, he became more and more involved with courts and princes. When Maximilian's daughter, the Princess Elizabeth, was married to Charles IX. king of France, he was commissioned by the court to accompany her to Paris. The young queen appointed him attendant of her household and of all her affairs, and, when, on the premature death of her husband, she quitted France,

she left Busbequius at Paris as her agent and representative. When the Emperor Rodolph ascended the throne of the Cæsars, he appointed him his ambassador to the French court, where Busbequius remained until 1592. Having then obtained permission to visit Flanders, his native country, in order to put his estates and private affairs in order, he left the French court and took his way through Normandy. Unfortunately it was a time of trouble and civil war. The faction of the League were in arms against the government, and occupied or over-ran a good portion of the kingdom. Busbequius had very properly furnished himself with passports from both parties, from the Leaguers as well as from the court, but his passes did not save him from being robbed and ill-treated by a party of Leaguers at Cailli, a village in Normandy, about three leagues from Rouen. On representing to them the inviolable and sacred rights attached to his character as ambassador, the brigands set him at liberty, and even restored the bulk of his baggage. But Busbequius, now an old man, had received a shock from which he did not recover. Instead of continuing his journey into Flanders, he ordered his attendants to convey him to the house of Madame de Maillot, at Saint Germain, close to Rouen, where he died in a few days, on the 28th of October, 1592. Philip Camerarius, Joseph Scaliger, and other writers, assert that he was murdered by the robbers, but the well authenticated facts regarding his death are what we have stated.

The body of Busbequius was honourably interred in the church of the place where he died, and his heart was carried to Flanders to be placed in the tomb of his ancestors.

As a literary character and a man of refined taste, this distinguished diplomatist occupies a very honourable place. The letters in which he describes his two journeys into Turkey, his residence at the court of Solymán, &c., which are in Latin, and were published under the title of '*Augerius Gislelini Busbequii Legationis Turcicæ Epistolæ Quatuor*,' are admirably written, and abound in information which will always be interesting, and which was of great political utility at the time he wrote, when the cabinets of Europe knew not what to make of the Ottoman Porte. He thoroughly understood the state of the Ottoman empire, which was then the bugbear of Europe, and he laid down a judicious system for resisting and attacking it, in a treatise entitled, '*De Re Militari contra Turcam instituendâ consilium*.' The orations which he delivered in France to the different French kings have been very much praised, but we cannot speak of these of our own knowledge. Besides contributing to various scientific and literary works, Busbequius was the author of some interesting letters on the state of France under the reign of Henry III., and on the expedition of the duke d'Alençon to the Low Countries. These letters, addressed to the Emperor Rodolph, were first published in 1632.

Notwithstanding the constant labours of correspondence and diplomacy, he found time, while in Turkey, to collect inscriptions, coins, manuscripts, rare plants, and other specimens of natural history. On his second embassy he engaged and took with him an artist to make drawings of curious botanical and zoological specimens, at that time little known in the west of Europe. The fruits of his taste, judgment, and liberality frequently appear in the works of Gruterus, Mathioli, and other contemporary writers.

Busbequius spoke seven languages—Latin, Italian, French, Spanish, German, Flemish, and Slavonian in perfection. He always wrote in Latin; and the Latinity of his Turkish travels has been much admired by scholars. This book, which has appeared in all the modern languages of civilised Europe, was translated into English, and went through several editions in the course of the last century. A very good edition, with index, was published at Glasgow by Robert Urie in 1761. The title is '*Travels into Turkey*.' Translated from the original Latin of the learned A. G. Busbequius. (Busbequius's works, as named above; Bayle, *Dictionnaire Historique et Critique*; and Guicciardini's *Italian Hist.*)

BUSBY, RICHARD, second son of Richard Busby, of the city of Westminster, was born at Luton in Northamptonshire Sept. 22, 1606. Having passed through Westminster school he was elected student of Christchurch, Oxford. So low were his finances that his fees for the degrees of bachelor and master of arts were defrayed by donation from the parish of St. Margaret, Westminster, 5*l.* having been given him for the former, and 6*l.* 13*s.* 4*d.*

for the latter. This favour he gratefully acknowledged in his will by leaving 50*l.* to the poor housekeepers in that parish, having already bequeathed to the parish for charitable purposes an estate of 525*l.* per annum, and very nearly 5000*l.* in personal property. In 1639 he was admitted to the prebend and rectory of Cudworth in the church of Wells, and on the 13th of December in the following year he was appointed head master of Westminster school, in which occupation he laboured during more than half a century, and by his diligence, learning, and assiduity has become the proverbial representative of his class. In July, 1660, he was installed as prebendary of Westminster, and in the following August he became canon residentiary and treasurer of Wells. At the coronation of Charles II. in 1661 he had the honour of carrying the ampulla. His benefactions were numerous and most liberal. He died April 6th, 1695, full of years and reputation, and was buried under a suitable monument in Westminster Abbey. His works were principally for the use of his school, and consist for the most part either of expurgated editions of certain classics which he wished his boys to read in a harmless form, or grammatical treatises, chiefly in a metrical form. The severity of his discipline is traditional, but we do not find that it rests upon any sound authority; and strange as it may appear, no records are preserved of him in the school over which he so long presided. The accusation of 'devilish covetousness' brought against him by the gossiping Pepys (*Memoirs*, iii. 211) is sufficiently disproved by the munificence of his will, in which he did not capriciously endow public institutions which accident suggested to him on a deathbed, but fulfilled a design long entertained of bequeathing sums to be employed in useful purposes by the heads of those places of education to his connexion with which he was indebted for all his wealth.

BÜSCHING, ANTON FRIEDRICH, was born at Stettin, in Westphalia, studied at Halle, and afterwards went to Petersburg as tutor to the children of Count Lynar, the Danish ambassador to the court of Russia. He was early struck with the want of good geographical works in his time, and he applied himself to supply the deficiency. Having gone to Copenhagen, he published, in 1752, a description of the duchies of Holstein and Sleswick, which was much approved of. In 1754 he was appointed professor of philosophy at Göttingen, and would have obtained the chair of theology in that university but for a treatise in which he expressed opinions which were considered as swerving from Lutheran orthodoxy. About 1760 he was elected pastor of the German Protestant church at Petersburg, where he remained four years, and founded a Lyceum, which soon became one of the best institutions for education in the Russian capital. Having disagreed with Count Münich, who was protector of the German church, he left Petersburg in 1765, notwithstanding the solicitations of the Empress Catherine, who wished to retain him in Russia. In 1766 he was appointed Director of the gymnasium of Grauen Kloster, at Berlin. He composed for that institution a number of elementary works, which became very popular in North Germany. Büsching however is more generally known for his 'Neue Erdbeschreibung' or Universal Geography, the first part of which appeared in 1754. In 1759 he had completed the description of Europe in eight volumes, which became a standard work. He was one of the first modern writers who introduced in a work of descriptive geography statistical information on the wealth, industry, commerce, and institutions of the various countries. His statements were made after careful inquiry, and were generally accurate. Büsching's description of Europe was translated into English—'A new System of Geography,' 6 vols. 4to., London, 1762. His account of the northern countries, Denmark, Norway, Sweden, the Netherlands, and Germany, is the most full and elaborate part of the work. Germany, in particular, is treated very minutely, and occupies about one-half of the whole. It was translated into French under the title 'Atlas Historique et Géographique de l'Empire d'Allemagne,' 4 vols. 4to. It is still valuable as a book of reference about the late German empire. Büsching's whole work went through eight editions in his lifetime, and was translated into the principal European languages. In 1768 he published the 1st vol. of Asia, which treated of Asiatic Turkey and Arabia, but went no further with it. He published also 'Magazin für die neue Historie und Geographie,' 23 th. 4to., Hamburg and Halle, 1767-93.—'Nachrichten

von dem Zustande der Wissenschaften und Künste in dem Dänischen Reichen und Ländern,' 3 vols. 8vo., Copenhagen, 1754-64; besides numerous other works of geography, biography, education, and likewise on religious subjects. His 'History of the Lutheran Churches in Russia, Poland, and Lithuania,' has been mentioned with praise. Of his biographies, that of the great Frederic has been translated into French by D. Frank. 'Caractère de Frederic II.' 8vo., Born, 1788. Büsching was a most indefatigable writer, honest and independent; and he laboured earnestly for the advancement of education, and general information. The Prussian government afforded him encouragement and support; and in his latter years his correspondence, which was very extensive, was made free of postage charges. He died at Berlin, in May, 1793.

BUSHEL. This word seems to be a diminution of an old English word *buss*, signifying a box or vessel, and still used for small fishing-boats. In Matthew Paris (cited by Ducange) there is *Busholes* as a Latin plural. In middle Latin there is *bussellus*, *buscellus*, *bustellus* (whence *bouteille*, *botte*, and *potte*), and *butticella* from *butta* (butt). The latter word, the origin of all, so far as the Latin is concerned, was a general measure,—of land, for instance. [Ducange.]

Fleta describes the bushel as containing eight pounds (libra) of corn, and eight bushels as making a quarter (quartarium): Spelman, as containing four gallons (galones) of wine. Dr. Bernard asserts the bushel to be 72 pounds troy of common corn (triticeum), or 39'1667 avoirdupois. By the act of 1697 the Winchester round bushel was to be 18½ inches in internal diameter and eight inches deep, or 2150'42 cubic inches. The standard of length implied was the old exchequer standard. By the act of 1824 the standard gallon contains 10 pounds avoirdupois of pure water, eight such gallons make a bushel, and eight bushels a quarter. This, by the other provisions of the act, made it contain 2218'2 cubic inches very nearly. The content of the bushel seems to have been gradually increasing. Aibuthnot (1727) makes it 2178 cubic inches: Eisenschmidt (1737) 2180'4 cubic inches. The bushel is now 36'347 French litres. The *heaped* bushel, for goods which were heaped above the measuring vessel, such as coals, fruit, &c., and which was estimated at 2815'5 cubic inches, was abolished by 4 and 5 Will. IV. cap. 49, an act which took effect from the first of January, 1835. [WEIGHTS AND MEASURES.]

BUSHIRE. [ABOUSHEHR.]

BUSHMEN. [BOJRSMAANS.]

BUSKIN, a covering for the leg, commonly a strong outer garment, fit for a defence against dirt, thorns, &c. This word is also used in English as the translation of the Greek and Latin word *coturnus*, which signifies a high-heeled shoe or boot used by the Greek and Roman tragic actors to give an appearance of elevation to their stature, in conjunction with the mask and other stage properties. *Coturnus* in Latin is employed in contradistinction to *soccus*, the flat-soled shoe worn by comedians. Hence in English authors the words *buskin* and *sock* are often used for the tragic and comic drama. So Dryden;

'Great Fletcher never treads in buskins here,
Nor greater Jonson dares in socks appear.'

BUSSAHER or **BUSSAHIR**, a principality in Northern Hindustan, occupying a mountainous tract on both sides of the Himalaya range. Bussaher is bounded on the N.W. by the Sutleje, on the S. and S.E. by the Jumna, on the S.W. by Sirmore, and on the N. and E. it extends to the empire of China. Over a considerable part of this territory, the boundaries of which are but imperfectly known, the rajah of Bussaher exercises only a kind of feudal superiority, the rulers of the petty states into which it is divided paying an annual tribute to him as their head. The entire principality lies between 36° and 32° N. lat., and between 77° and 75° E. long.

Bussaher is divided into the districts of Kunawur; the tract containing Rampore, the capital, and Seran; the valley of the river Paber; and Desau, which contains the Tartar pergunnah of Hangarang. Kunawur is a rugged district between 31° 33' and 31° 31' N. lat., and between 77° 47' and 78° 42' E. long., extending on the E. to Shipke, the frontier town of Chinese Tartary, and on the W. to Hangarang. The Kéubrang pass in the Himalaya Mountains, which is 13,130 feet above the level of the sea, forms the boundary between Kunawur and Chinese Tartary where

the latter country is under the dominion of the grand lama of Lassa. The N. extremity of Kunawur is at Shialkur, a hill fort near the river Spiti in 32° N. lat. and 78° 34' E. long., the level of which is 10,118 feet above the sea. The climate of this district is cold, and a great part of the soil is uncultivable, being composed of eminences covered with snow, with chasms between them inaccessible to the husbandman. Barley and grain is raised, and the chief employment of the population is breeding and rearing sheep, goats, ponies, asses, and mules. The wool which is produced is exported in considerable quantities, and the greater part of the animals here named, including sheep and goats, are used as beasts of burthen in carrying on the traffic with Hindustan, Tibet, Cashmere, and Nepal. The inhabitants engage largely in trade and enjoy a good reputation for honesty and punctuality in their dealings. The villages are neither numerous nor populous, the largest not containing more than 100 inhabitants; several of them exhibit the appearance of wealth and civilization. The majority of the inhabitants are Hindus, but in some of the villages the people are adherents of the grand or Dalai Lama of Lassa.

Rampore, the capital of the principality, is situated in 31° 27' N. lat. and 77° 38' E. long.; on the left bank of the Sutleje, where that river is little more than 200 feet wide, and confined by lofty precipices, between which the water foams and dashes furiously. The passage across the stream is effected by a bridge of ropes, traversed by a block of wood, upon which the traveller sits and is drawn across. Rampore is considered a place of much sanctity, and is therefore at all times greatly frequented by religious mendicants: it contains several temples. The town has much fallen off from its former prosperity, and contains only about 150 stone and slated dwellings: it is the usual place of residence of the rajah, who has also a summer palace at Seran, about 22 miles higher up the river. This residence of the rajah is on a hill three miles from the banks of the Sutleje, and 4500 feet above its level.

The third district, that which contains the valley of the river Paber, is the most productive part of the principality, but some portion even of this is wild and barren. Iron ore is found in this district, and is worked, when the iron forms an article of export to the Seik countries. Dasau produces wheat and barley, but not rice. Near the villages and in sheltered spots, apricots, gooseberries, and currants are found, but the trees and bushes are stunted. The greatest part of the wealth of the inhabitants consists of ponies and mules. Manufactures of coarse blanketing are carried on in the district. In other parts of Bussaher woollen cloths of a superior texture are made, the wool being of excellent quality; a small quantity of shawls are likewise made of goat's and sheep's wool mixed.

Bussaher receives from Hindustan sugar, cotton, hardware, and indigo, and makes returns in iron, opium, tobacco, turmeric, and blankets. From Tibet and the Chinese territories are brought shawl-wool, salt, tea, silk goods, musk, and borax: the returns are grain, iron, and opium, cotton cloths, indigo, and other articles received from the lower parts of Hindustan.

The principality was conquered in 1810 by the Gorkas, and remained subject to them until 1814, when it was, through the armed intervention of the British, restored to the rajah, who, by a sunnud or treaty, dated in November, 1815, was made to contribute an annual sum of 15,000 rupees towards the expense of the force maintained by us; four forts on the banks of the Paber were retained by the British as stations for the protecting troops, and in the event of war, the rajah of Bussaher bound himself to place his troops under the orders of the British. The whole principality is thinly inhabited, but no attempt has been made to ascertain the actual population. (*Reports of Committee of House of Commons, 1832.*)

BUSSY D'AMBOISE, LOUIS DE CLERMONT DE, one of the favourites of the Duke of Anjou, brother of Henry III., king of France. Little is known of this minion but the history of his desperate bravery and his crimes. During the massacre of St. Bartholomew, having joined the assassins, he murdered with his own hand his relation, Antoine de Clermont, with whom he had a law-suit for the marquise of Réné; but the edict which soon afterwards passed in favour of the Huguenots deprived him of any profit from this bloody deed. He afterwards commanded at Angers, where his exactions rendered him most unpopular;

and having long interrupted the tranquillity of Paris by private brawls and combats, in which he set at nought the terrors of the Bastille and the authority of the king, he became so odious to Henry III. by frequent acts of presumption, that he gave information to Charles de Chabres, Count of Montsoreau, of an intrigue which Bussy carried on with his wife. The secret had been revealed to the king by his brother of Anjou, to whom Bussy had jestingly written in one of his letters that he 'had the game of the mighty master in his toils.' Montsoreau compelled the wretched adulteress to write a letter with her own hand, making an assignation in the Château de Constancières, where the injured husband awaited Bussy with a numerous ambuscade of armed men, and, in spite of a most courageous resistance, put him to death on August 19th, 1579. (De Thou, lxxviii. 9.)

Brantôme (*Discours*, lxxv.) has made what he calls an *éloge* of Bussy. It contains nothing more than anecdotes of his pugnacity, which the writer mistakes for true courage, and a frightful picture of the misrule and demoralization of the reign of Henry III. A single line in the epitaph of Bussy, which is there given, conveys a finished portrait of his character:—'Son plaisir fut sa mort, ses plaisirs ses combats.'

BUST, in sculpture, means a statue truncated below the breast. The etymology of the word is not very clear. The Romans called 'bustum' the place where they burnt the bodies of the dead, from 'bustum,' burnt. Bustum was afterwards used for the grave in which the body was buried; and lastly, in the latinity of the lower ages, for the dead body itself: 'Sanctorum busta,' the bodies of martyrs (Ducange). Bustum seems to have been used more especially for the trunk of the body without the head: 'Quinque hominum busta sine capite cæsa.' (*Annal. Mediolan.* in Muratori.) In the old French, 'bu' meant the trunk: 'Car ils ont bien armé le chef et le bu.' (*Old French Romance*, Ducange.) 'Busto,' in Spanish and Italian, has a similar meaning. The Italians call also 'busto' the stays which embrace and support the breast. In sculpture, however, bust includes the head, shoulders, and breast, with the arms truncated above the elbow, and as such, it forms a large department of the art. Busts were mostly used by the ancients to represent likenesses of individuals, and were placed either upon sepulchral monuments, or in the interior of houses, or in gardens. The Greek word *Hermæ* has been sometimes considered as synonymous with the modern bust, but the *Hermæ* were merely heads placed on a block of stone.

BUSTAR, a district and town in Gundyana, the latter situated in 19° 31' N. lat. and 82° 28' E. long. The part of the country in which this district occurs has been very little explored; it is difficult of access, and so unhealthy as to discourage the visits of travellers. This district is occupied by a branch of the range of mountains that runs through the Circars parallel to the bay of Bengal. Nearly the whole of the country consists of hills covered with jungle, and of unhealthy morasses; the remainder, constituting not more than one-fifteenth part of the entire area, is very imperfectly cultivated by the scanty population, who live almost in a state of nature, and subsist on the produce of the chase. The principal river up Bustar is the Inderowty or Indravati, which is not navigable owing to the rocks in its bed. The forests of this district abound with teak trees large enough for ship-building; and it is said, that if made into rafts they could be floated down the Inderowty to its junction with the Godavery, and thence to the bay of Bengal. The river Mahanuddy has its source in this district, and flows eastward to Sumbulpore, which district it enters a few miles east of Sri Narraïn.

The inhabitants are extremely ignorant and superstitious; the practice of sacrificing human victims to the goddess Devata Iswari Devi, continued to a recent date, but has been stopped through the interference of the British. All culprits and prisoners of war, and, when this supply failed, their innocent fellow-countrymen were sacrificed at the shrine of the goddess.

The remainder of Bustar is subject to the Nagpore state, and pays to it an annual tribute of 15,000 rupees.

BUSTARD, in Latin *Otta*, a genus of land birds whose proper position in the ornithological system has caused some embarrassment to zoologists. Temminck places it under his twelfth order, *Cursores* (Runners), observing that the genera *Struthio*, *Rhea*, and *Cassarius* ought to stand at the head of that order. Cuvier arranges the

Bustards under the *Pressirostres*, his second family of his fifth order (*E'chassiers*,—*Grallæ*, Lin.) of birds, between the Cassowaries on one side and *Edicnemus* (thick-kneed bustard or stone curlew) on the other. Temminck makes *Cursorius* immediately succeed it, and observes that among the species of that genus the passage between *Otis* and *Cursorius* may be possibly found. It appears that the bustards partake of the organization of the struthious, gallinaceous, and wading birds (*E'chassiers*,—*grallatores*). *Rhea*, without alluding to the *Dodo* on the struthious side, *Edicnemus* on that of the plovers, and the turkey on the side of the gallinaceous birds, make near approaches to the genus under consideration, while the *Cariama* of Brisson (*Microdactylus* of Geoffroy, *Dicholophus* of Illiger), a South American form, seems to be one of its nearest representatives on the new continent (*Cariama*). Vigors places the genus in his family *Struthionide*—(order *Ravores*)—which occupies a position between the *Cracide* and the *Tetraonide*, while it approximates to the *Gruide* and *Charadriade* in the order *Grallatores*; and, taking all the circumstances into consideration, this seems to be the best arrangement hitherto proposed.

The bustards live generally in open countries, preferring plains or wide-spreading extensive downs dotted with low bushes and underwood, localities which give them an opportunity of deservng their enemy from afar. They are said to fly but rarely,* running from danger with exceeding swiftness, and using their wings like the ostriches to accelerate their course. When they do take wing their flight is low, and they skim along the ground with a sufficiently rapid and sustained flight. Their food consists of vegetables, insects, worms, grain, and seeds. They are polygamous, one male sufficing for many females, which, after fecundation, live solitary. Temminck says that it would seem that they moult twice a year, and that the males in the greatest number of species differ from the females in having extraordinary ornaments, and in possessing a more variegated plumage. He further observes, that the young males wear the garb of the female during the first and second year, and adds his suspicion that the males in winter have the same plumage as the females. Cuvier notices their massy port and the slightly arched and vaulted upper mandible of their beak, which, with the little webs or palmations between the bases of their toes, recal the form of the gallinaceous birds; but he adds that the nudity of the lower part of their legs, all their anatomy, and even the flavour of their flesh, place them among the *E'chassiers*, and that, as they have no hind toe, their smallest species approach nearly to the plovers.

The following is the generic character given by Temminck, slightly modified.

Bill of the length of the head or shorter, straight, conical, compressed, or lightly depressed at the base; point of the upper mandible a little arched (voûtée.)

Nostrils oval, open, approximated, distant from the base.

Feet long, naked above the knee, three front toes short, united at their base, bordered by membranes.

Wings moderate, the third quill longest in each wing.

Geographical distribution. The form occurs in Europe, Asia, and Africa; but is not developed in America.

EUROPEAN SPECIES.

Of these the great Bustard, *Otis*, and *Avia tarda*, of Belon and others, *Ostarde*, *Hoularde*, *Outarde*, *Bistarde* of the French, *Starda* and *Starda commune* of the Italians, *Der grosse Trappe*, *Trapp*, *Trappgans*, and *Ackentrapp* of the Germans, *Abutard* (*avis tarda*) of the Spaniards, *Gustard* of the old Scotch, *Yr araf chedydd* of the Welsh, and *Otis tarda* of Linnaeus, will serve as an example.

From passages in the 'History of Animals' (ii. 17. v. 6), there can be scarcely a doubt that our great bustard is Aristotle's *ótis* (*Otis*). Indeed the doubts originated in a misunderstanding, passage in the thirty-third chapter of his ninth book; and it is clear from several authorities that the bird and the quality of its flesh were well known to the Greeks. Pliny evidently alludes to these birds as those 'quas Hispania aves tardas appellat, Græcia otidas' (*Nat. Hist.* x. 22), though he blunders about the flesh, telling an absurd story of its effects, which arises from his confounding the *ótis* with Aristotle's *ótis* (*Otus*), an owl.

Description. Selby's figure of the male was taken from a particularly fine full-grown specimen, weighing twenty-

* See, however, the habits of *Otis Tarda*, post.

eight pounds, and shot about six years ago,—the date of the volume is 1825,—by the Rev. Robert Hamond of Swaffham in Norfolk, in whose possession it then was, as well as two females, and a young bird of a month old. The following is Selby's description:—

Male. Bill strong, greyish white; the lower mandible palest. Head, nape of the neck, and under parts, bluish grey. A streak of black passes along the side of the head, reaching to the occiput. Chin, throat, and moustaches composed of long, wiry feathers, with the barbs disunited and short. Fore part of the neck clothed with a naked bluish-black skin, extending upwards toward the ear-coverts, and covering the gular pouch. Sides of the neck white, tinged with grey; lower part of the neck fine reddish orange. At the setting on of the neck, or between the shoulders, is a space destitute of feathers, but covered with a soft grey down. Scapulars buff orange, barred and spotted with black. Back, rump, and tail-coverts reddish orange, barred and variegated with black. Greater coverts and some of the secondaries bluish grey, passing towards the tips into greyish white. Quills brownish black, with their shafts white. Tail-feathers white at their bases, passing towards the middle into brownish orange, with one or two black bars; the tips often white, and, when the feathers are spread laterally, forming a segment of a circle. Upper part of the breast reddish orange; lower part, belly, and vent white. Legs black, covered with round scales. Irides reddish brown.

The gular pouch is capable of containing a considerable quantity of water. Pennant says seven pints; Montagu talks of the same number of quarts but doubts the quantity, as he well may, nor does he give any authority for the greater capacity. May not he have misread Pennant, who obtained his information from Dr. Douglas, said to have been the first discoverer of this reservoir? In a specimen mentioned by Graves, weighing twenty-two pounds and a half, the pouch was capable of containing rather more than two quarts. Dr. Douglas supposes that the bird fills this natural water-bag as a supply in the midst of those dreary plains where it is accustomed to wander; and Bewick adds that one of these birds, which was kept in a caravan, among other animals, as a show, lived without drinking. It was fed with leaves of cabbages and other greens, and also with flesh and bread. Others conjecture that this pouch is a provision for conveying water to the female during the time of incubation and to the young. It is true that the female is without this appendage; but it should be remembered that the best authorities agree in stating that the male is never seen in close company with the female excepting before incubation. Some again suppose that the use of this bag is to enable the bird to eject the water by muscular compression in the faces of birds or beasts of prey, by way of a defence. The average length of a male is three feet three inches.

Female.—Head and forepart of the neck of a deeper grey, and without the moustaches and gular pouch. Back of the lower part of the neck reddish orange. The other parts of the plumage similar to that of the other sex. Size seldom more than one-third of that of the male.

Young.—At a month old covered with a buff-coloured down, barred upon the back, wings, and sides with black.

Locality.—Johnston censures Pliny for saying that bustard is peculiar to Spain, observing that among of localities it is a native of Boeotia, in the neighbourhood of the Cephissus; and the editor of the last edition of Pennant says that the bird, still retaining its ancient name (*Otis*), is found in all the great plains of Greece. Aldrovandus observes that Italy has none of these birds, unless they were brought over accidentally by tempests; but Willughby, in his text, says, 'We, when we travelled in Italy, did see in the market at Modena a bustard to be sold, whence we suspect that there are of them in that country.' In his preface however he corrects himself, saying, 'I am now persuaded that the *Stella avis* of Aldrovandus is a different kind from the bustard, and that the bird we saw in the market at Modena was this *Stella*, for to my best remembrance it was much less than a bustard, and therefore I revoke what was said in contradiction to Aldrovandus his affirmation, that the bustard is a stranger to Italy; but it is very likely that this *Stella avis* is the same with the *Anas campestris* of Bellonius.' The bird alluded to last by Willughby is the *Field-duck*; *Cane pettière*, of the French, *Otis tetraon* of Linnaeus, our *Little Bustard*, and

Prince Bonaparte mentions it as occurring near Rome, in the winter, but very rarely, and praises the delicacy of its flesh, '*Carne squatta, riccissima*.' He omits the Great Bustard entirely, and no doubt intentionally. Yet Selby says, 'It is found in some provinces of France, and in parts of Germany and Italy. It is common in Russia and on the extensive plains of Tartary; and Temminck states that it inhabits some departments of France, of Italy, and Germany; but it is less abundant towards the north than in the south; and that it is very rarely and accidentally found in Holland.' Graves relates that the species is dispersed over the southern parts of Europe, and the more temperate parts of Africa, and is very abundant in some parts of Spain and Portugal. In our own islands, the increase of population and civilization, followed by greater demands on the land, and consequently by an extension of cultivated surface, have so reduced the bustards that, unless care be taken to preserve the few which remain, they will soon be numbered among the other extinct species of our Fauna. We will endeavour to trace the old British localities of these noble birds. They are called, says Willughby, 'by the Scots *Gustards*, as Hector Boethius witnesses in these words:—'In March, a province of Scotland, are birds bred, called in the vulgar dialect *Gustards*, the colour of whose feathers and their flesh is not unlike the partridges, but the bulk of their body exceeds the swans.' The editor of the last edition of Pennant states that, in Sir Robert Sibbald's time, they were found in the Mers, but that he believes that they are now extinct in Scotland. Willughby also says (1678), 'On Newmarket and Royston Heaths, in Cambridgeshire and Suffolk, and elsewhere, in wasts and plains they are found with us.' Ray (1713) thus writes:—'In campis spatiosis circa Novum Mercatum (Newmarket) et Royston oppida in agro Cantabrigiensi, inque planitie, ut audio, Salisburyensi, et alibi in vastis et apertis locis, invenitur.' In Brookes's Ornithology (1761) the following passage occurs:—'This bird (the bustard) is bred in several parts of Europe, and particularly in England, especially on Salisbury Plain, Newmarket and Royston Heaths, in Cambridgeshire and Suffolk; for it delights in large open places.' The flesh is in high esteem, and perhaps the more so because it is not very easy to come at. Pennant says, 'These birds inhabit most of the open countries of the south and east parts of this island from Dorsetshire as far as the Wolds in Yorkshire.'

The editor of the last edition (1812) observes that 'the breed is now nearly extirpated, except on the downs of Wiltshire, where it is also very scarce.' The figure of the male bird given by Graves is said to have been drawn from one taken alive on Salisbury Plain in 1797. Montagu, in his Dictionary (1802), says, that in this locality it had become very rare from the great price given for the eggs and young to hatch and rear in confinement. In his Supplement (1813) he states that not one had been seen there for two or three years previous. 'We are old enough to remember seeing one, and sometimes two, bustards as the crowning ornaments of the magnificent Christmas larder at the Bush Inn, Bristol, in the reign of John Weeks, of hospitable memory; and we have heard, too, a romantic story of the last of the Salisbury Plain bustards (a female) coming into a farmer's barn, as if giving herself up. Graves says that, in the spring of 1814, he saw five birds on the extensive plains between Thetford and Brandon, in Norfolk, from which neighbourhood, in 1819, he received a single egg, which had been found in a large warren. In the autumn of 1819, he adds, a large male bird, which had been surprised by a dog on Newmarket Heath, was sold in Leadenhall Market for five guineas; and in the same year, he continues, a female was captured, under similar circumstances, on one of the moors in Yorkshire. When the mania for real British specimens of birds was prevalent, the bustards suffered not a little. We know a collector who, about the year 1816, had nine dead bustards before him together, they came from Norfolk. Bustards have been heard of within these last few years on North Stow Heath, near Colford, in the neighbourhood of Bury St. Edmund's; and we are happy to be able to state that in the locality from whence Selby obtained his specimen, the bustard is still in existence and most carefully preserved. In this, the western part of Norfolk, a nest is generally hatched off every year. In the summer of 1834, a nest of three eggs was hatched in an open corn-field about half a mile from High House; and, in December in that year,

three great bustards were seen about a mile from it. They shift about from place to place, and are seldom seen but in the open country. We earnestly hope that every one, sportsman or no sportsman, will respect this little remnant of the numerous flocks which once graced our island, and second the endeavours of the spirited owner of the property on which they have found refuge, to save the breed of this noble bird from utter extinction in England. In the eastern part of the county we fear that it is quite lost, though it was comparatively common some time ago. It is the more necessary to impress on our readers the importance of abstaining from the preserved few above alluded to, because there is not much hope of replenishing the breed by captive birds. Graves's male bird above mentioned lived about three years in confinement; and, though a female was procured from the continent, she never laid while confined. These birds ate turnip, cabbage, and lettuce leaves, also the blades of young corn; during the winter they were fed with grain, which they always preferred when soaked in water; they would likewise devour worms and slugs.

Food.—Willughby says that the bustard feeds upon corn, seeds of herbs, colewort, dandelion leaves, &c. In the stomach of one which he dissected he found a great quantity of hemlock-seed, with three or four grains of barley, and that in harvest time. Brookes states that they feed upon frogs, mice, small birds, and different kinds of insects. Pennant makes their food to consist of corn and other vegetables, and those large earth-worms that appear on the Downs before sun-rising in the summer. Montagu states it to be green corn, the tops of turnips, and various other vegetables, as well as worms; but adds, that they have been known to eat frogs, mice, and young birds of the smaller kind, which they can swallow whole. Turnip-tops are certainly a favourite article of diet with these birds; and we believe that the nine bustards above-mentioned owed their fate to their fondness for this vegetable—being laid in wait for at their feeding-time. Temminck says that their nourishment consists very much of insects and worms, and also of grain and seeds.

Propagation.—The eggs, two in number generally, sometimes three, are laid upon the bare ground, which is often a little hollowed out by the female (occasionally, says Selby, among clover, but more frequently in corn-fields), early in the spring. They rather exceed those of a turkey in size, and their colour is a yellowish brown, inclining to oil-green, with slight darker variations. Time of incubation four weeks. The young as soon as hatched follow the parent, but are incapable of flight for a long time.

Habits.—The extreme rapidity of their running, and the unwillingness to rise on the wing exhibited by these birds, have been the theme of most ornithologists. We have also many accounts of their being coursed with dogs. The following is from Brookes:—'There are also bustards in France, which frequent large open plains, particularly near Chalons, where, in the winter-time, there are great numbers of them seen together. There is always one placed as a sentinel, at some distance from the flock, which gives notice to the rest of any danger. They raise themselves from the ground with great difficulty; for they run sometimes a good way, beating their wings before they fly. They take them with a hook baited with an apple or flesh. Sometimes fowlers shoot them as they lie concealed behind some eminence, or on a load of straw; others take them with greyhounds, which often catch them before they are able to rise.' Selby, who has evidently had good opportunities of observation, thus writes in his Illustrations:—'Although in a state of confinement the bustard becomes tolerably tame to those who are in the habit of attending it, yet it displays at all times considerable ferocity towards strangers; and all attempts to continue the breed in that state have been without success. With respect to its habits in the wild state, it is so shy as seldom to be approached within gun-shot; invariably selecting the centre of the largest inclosure, where it walks slowly about, or stands with the head reposing backwards upon the bare part of its neck, and frequently with one leg drawn up. Upon being disturbed, so far from running in preference to flight (as has been often described), it rises upon the wing with great facility, and flies with much strength and swiftness, usually to another haunt, which will sometimes be at the distance of six or seven miles. It has also been said, that in former

days, when the species was of common occurrence, it was a practice to run the young birds (before they were able to fly) with greyhounds. So far from this possibility existing with the present remnant of the breed, the young birds, upon being alarmed, constantly squat close to the ground, in the same manner as the young of the lapwing, golden plover, &c., and in that position are frequently taken by hand; indeed this is even the habit of the female during incubation. Selby's remarks on its powers of flying are corroborated by the 'Booke of Falconrie or Hawking' (1611), where under the head of 'Other flights to the field called great flights,' at p. 83, we find it thus written:—'There is yet another kind of flight to the feldes, called the great flight, as to the cranes, wild geese, bustard, bird of paradise, bittors, shovellers, hearons, and many other such like, and these you may flee from the fist, which is properly termed the source. Nevertheless, in this kind of hawking, which is called the Great Flight, the falcons or other hawks cannot well accomplish their flight at the cranes, bustard, or such like, unlesse they have the helpe of some spaniell, or such dogge, wel inured and taught for that purpose with your hawke. Forasmuch as great flights requiro pleasant ayde and assistance, yea and that with great diligence.' As an article of food the flesh of the bustard is held in great estimation. It is dark in colour, short in fibre, but sweet and well flavoured. In the last edition of Montagu's Dictionary it is stated, that in 1804 one was shot and taken to Plymouth market, where a publican purchased for a shilling what would have fetched two or three guineas where its value was known. It was however rejected at the second table as improper food, in consequence of the pectoral muscles differing in colour from the other parts of the breast, as in some of the grouse. There were country gentlemen supping at the inn on the following evening, and hearing of the circumstance, they desired that they might be introduced to the princely bird, and partook of it cold at their repast. The bustard seems, with accidental exceptions, to have always brought high prices. We do not indeed find it at the feast given at the 'intronazation' of George Nevell, Archbishop of York, in the reign of Edward IV.; but, in the Earl of Northumberland's household book, it appears among the birds appropriated to his lordship's table; it has no price placed opposite to it, as in the case of all the other birds with one other exception.

[Otis Tarda. Female.]

ASIATIC SPECIES.

We select *Otis nigriceps* as an example. The specimen from which the figure in Mr. Gould's magnificent work ('Century of Birds from the Himalaya Mountains') was taken, was brought from the highlands of the Himalaya; but it is by no means confined to that locality. Col. Sykes observed it in the wide and open country of the Mahrattas, where it lives in large flocks, and where it is considered one of the greatest delicacies as an article of food. It is indeed so abundant in the Deccan, that Col. Sykes records, in the

[Otis Tarda. Male.]

[Otis Nigriceps. Male.]

Proceedings of the Zoological Society, that one gentleman shot nearly a thousand.

Description. Male.—Body above, pale bay, lightly undulated with rufous-brown; neck, a few spots on the wings, and belly, white; the head, which is crested, the outer wing-coverts, the quills, and the large mark on the breast, black; irides deep-brown; bill and feet yellowish. Length, inclusive of tail, 50½ inches; tail, 13½ inches.

Female.—She resembles the male in plumage, but is only 41½ inches, including the tail, which is 10½ inches.

The male is furnished with the gular pouch, like *Otis tarda*.

Egg.—Col. Sykes found only one in a hole in the earth on the open plain, and that considerably advanced in the process of incubation. In shape it was a perfect oval; and in colour a brown-olive, with obscure blotches of darker brown-olive. Length 3¼ inches, diameter 2⅞ inches.

AFRICAN SPECIES.

***Otis caerulescens.* Description.**—Summit of the head marked with black and reddish zig-zags, straight and nearly approximated. Above the eyes extends a large whitish band, punctured as it were with brown; plumes near the ear-opening of a clear ruddy colour. Under the neck a demi-circular band of pure white; and below, another twice as large, of deep black. Front of the neck, breast, and all the other lower parts of a lead-colour. All the upper parts of the body of a reddish or yellowish brown, marked with black zig-zags and dots very near together. Lower coverts of the wings and tail-feathers unspotted, ruddy. End of the tail black, tinged with brown. Quills black. Feet yellowish-green. Bill brown, yellow at the base. Length 20 inches; height, when erect, 17 inches 6 lines.

Le Vaillant discovered this species in the interior of South Africa, inhabiting the Caffre country, and some parts of the colony of the Cape of Good Hope. Temminck, from whom the description and figure are taken, says that he is ignorant whether the female differs in plumage from the male, of which latter sex were the two individuals he had seen. There are specimens in the Museums of Paris and of the Pays-Bas.

[*Otis caerulescens.* Male.]

Though we have laid it down as a general rule not to carry our illustrations beyond one species of a section, the habits of one of the following bustards, and the unusual size of the other, must be our apology for shortly noticing them.

***Otis Denhami*,** the African bustard met with by Major Denham near the larger towns, did not occur in any great abundance. It frequented moist places, where the herbage was pure and fresh, and where it was taken in snares by the

natives for food. It was almost invariably seen singly, Major Denham never having observed a pair together more than once. It was always found in company with gazelles whenever a bustard was observed it was certain that the gazelles were not far distant. Major Denham praises its large and brilliant eye. The Arabs are accustomed to compare the eyes of their most beautiful women to those of the *Ouhara*, which seems to be a general name for the bustards in Africa. Gmelin has given the title as a specific distinction to an African bustard smaller than Major Denham's, which is 3 feet 9 inches in length*. But this is small in comparison with the bustard (*Otis Kori*) discovered by Mr. Burchell in South Africa, for that stood upwards of 5 feet high, and may be considered the most gigantic development of the form hitherto observed.

Burchell, in his travels in the interior of Southern Africa, a book which, in addition to its other attractions, contains much valuable zoological information, communicated by an acute and accurate observer of nature, gives the following account of his becoming possessed of this noble bustard on the banks of the Gariep. 'We shot a large bird of the bustard kind, which was called *Wilde Paauw* (Wild Peacock). This name is here very wrongly applied, as the bird to which it properly belongs differs from this in every respect. There are indeed three, or perhaps four, birds to which, in different districts, this appellation is given. The present species, which is called *Kori* in the Sielwana language, measured, in extent of wing, not less than seven feet, and in bulk and weight was almost greater than some of the people could manage. The under part of the body was white, but the upper part was covered with fine lines of black on a light chestnut-coloured ground. The tail and quill feathers partook of the general colouring of the back. The shoulders were marked with large blotches of black and white, and the top of the head was black; the feathers of the occiput were elongated into a crest; those of the neck were also elongated, loose, narrow, and pointed, and were of a whitish colour marked with numerous transverse lines of black. The irides were of a beautiful, pellucid, changeable, silvery, ferruginous colour. A representation of the head of the *Kori Bustard* (here copied), is given at the end of the chapter. Its body was so thickly protected by feathers that our largest sized shot made no impression; and, taught by experience, the hunters never fire at it but with a bullet. It is reckoned the best of the winged game in the country, not only on account of its size, but because it is always found to abound in fat. The meat of it is not unlike that of a turkey, but is certainly superior, as possessing the flavour of game.'

[Head of *Otis Kori*.]

In the first part of the 3rd vol. of the 'Descriptive and illustrated Catalogue of the physiological series of comparative Anatomy,' contained in the museum of the Royal College of Surgeons, in London, a work in every way worthy of the grand collection which it describes, there is represented at plate 33, fig. 3, the head of a bustard (*Otis tarda*) with the auditory feathers or 'auriculars' spread out, so as to expose the external aperture and passage of the ear; the anterior feathers being shown as pressed forwards, and the posterior feathers in their place, the anterior surface of the external meatus and the membrana tympani are brought into view.

* See Travels of Denham and Clapperton. Appendix, p. 119, 4to. edition.

BUTCHER-BIRD. [LANIADÆ.]

BUTE, JOHN STUART, third EARL OF, was the eldest son of John earl of Bute, in the Scottish peerage, and of Lady Anne Campbell, daughter of the first duke of Argyll. He was born in 1713, and received his education at Eton. He was introduced to public life in February, 1737, by being elected one of the sixteen Scottish representative peers. Such at least is the common account, which adds that he was sent up in the same character to every succeeding parliament till the year 1780. But in a sketch of his early life, quoted from a publication called 'The Contrast,' in the 'History of the Late Minority,' it is said, 'He was a man that at no time of life had opportunity or inclination of applying to business. When young he was disposed to quiet; and though having been at the close of a session elected one of the sixteen peers, yet by his opposing, right or wrong, all measures of government, he was at the next election excluded, and then in disgust retired to an isle in the kingdom of Scotland, where he spent many years in close monastical retirement.' If all this ever happened, it probably took place, not in 1737, but some years before, on his coming of age.

From 1737 he appears to have proceeded in a steady course of court favour. In that year he was appointed one of the Lords Commissioners of Police in Scotland, a Board which was suppressed in 1782. It was probably in this year also that he was introduced to the notice of Frederick Prince of Wales. Of the circumstances of this introduction 'The Contrast' gives the following curious account:—'The duchess of Queensberry having entertained her friends with the play of the Fair Penitent, the part of Lothario fell to the lot of his lordship, in which he succeeded so much better than in his late performances in the character of a statesman, that he was greatly admired, and particularly by his late Royal Highness Frederick Prince of Wales, who took great notice of this occasional Roscius, and invited him to Leicester House.' In August, 1738, he was made a Knight of the Thistle, and a few days after one of the Lords of the Bedchamber to the prince. On the death of Frederick in March, 1751, Lord Bute retired for some time to the country; but he is believed to have been consulted by the princess in regard to all points connected with the education of her son, afterwards George III. He was eventually appointed Groom of the Stole to that young prince. 'When it was proposed to settle the present king's household, as prince of Wales,' says Junius (note to Letter XXXV.), 'it is well known that the earl of Bute was forced into it in direct opposition to the late king's inclination. That was the salient point from which all the mischiefs and disgraces of the present reign took life and motion. From that moment Lord Bute never suffered the prince of Wales to be an instant out of his sight.' Mr. Adolphus, in his 'History of the Reign of George III.,' states that Blackstone at that time put the most interesting parts of his 'Commentaries' into the hands of Lord Bute, by whom they were laid before the prince. Various notices respecting Lord Bute, while holding office in the establishment of Leicester House, may be found in the 'Diary' of Bubb Dodginton.

On the accession of George III. (October, 1760), Lord Bute, who had obtained a great ascendancy over the mind of his pupil, was sworn a member of the privy council, and made Groom of the Stole. In March, 1761, he resigned that office, and was appointed one of the principal Secretaries of State. This elevation of the favourite to a place in the government was effected by the dismissal of Mr. Legge, the able chancellor of the exchequer, and by the concerted resignation of the earl of Holderness, into whose place Bute stepped, in consideration of a handsome pension, and the reversion of the wardenship of the Cinque Ports. Mr. Pitt however still continued for some time longer nominally at the head of the administration. On the 5th of October Mr. Pitt retired from the cabinet before the growing influence of the new secretary. Of the heads of the old Whig connexion, the duke of Newcastle, who was First Lord of the Treasury, still clung to office; but at length, on the 29th of May, 1762, he resigned, and Lord Bute was appointed his successor. On the 22nd of September following he was admitted a Knight of the Garter. On the 4th of April, 1761, his countess had been created a British peeress, by the title of Baroness Mountstuart, with remainder to her issue male by his lordship.

The history of the administration of Lord Bute belongs to the history of the country. It is written by the pen of a

bitter opponent, in the first eleven chapters of the work entitled 'The History of the Minority,' the object of which is a defence of the politics of Lord Chatham and Earl Temple Wilkes's weekly paper, the 'North Briton,' which began and ended with Lord Bute's administration, is also throughout occupied in the abuse of his lordship, and everything connected with him. The 'North Briton' was set up in opposition to the 'Briton,' a paper established in the interest of the minister. One of the principal objects of Burke's celebrated 'Thoughts on the Cause of the Present Discontents' (published in 1780), is to expose what he describes as the new project or system of government contrived and attempted to be carried into effect by this minister. But he observes, 'This system has not arisen solely from the ambition of Lord Bute, but from the circumstances which favoured it. . . . We should have been tried with it if the earl of Bute had never existed; and it will want neither a contriving head nor active members, when the earl of Bute exists no longer.' Lord Bute occupies a large share of the latter part of Dodginton's 'Diary,' which however only comes down to the 6th of February, 1761; but Mr. Adolphus, in the Appendix to the first volume of his History, has printed a series of 'Letters between Lord Bute and Lord Melcombe (Dodginton) on the state of parties and politics, previous to and during Lord Bute's administration,' which he had obtained from Mr. Penruddocke Wyndham, the publisher of the 'Diary.'

Whatever were his merits or his demerits, Lord Bute was certainly the most unpopular English minister of modern times. While he madly attempted to govern the country by the king's name alone, he had opposed to him not only all the old factions of the state, which he aimed at putting down and destroying, but the whole nation. Forced by circumstances, therefore, as well as on principle, for he professed to hold the doctrine that the ministers were not really the executive government, but literally only the servants or clerks of the crown, he surrounded himself while in power by individuals in general utterly incapable of adding strength to his ministry by their abilities or personal importance. The late Lord Liverpool, indeed, then Mr. Jenkinson, was his private secretary; but his chancellor of the exchequer, for instance, was Sir Francis Dashwood, afterwards Lord Despensers, a person wholly incompetent.

The only important event in Lord Bute's administration was the termination of the war with France, by the peace of Paris, concluded February 10th, 1763. It was long a strong popular belief that the English minister was bribed by France to consent to this treaty; but no evidence worthy of credit was ever brought forward to confirm this rumour. On the 8th of April, 1763, Lord Bute suddenly resigned. His friends generally gave out at the time that he had taken office only with the purpose of bringing the war to an end, and that in now retiring he only followed a determination which he had from the first openly avowed. His own account however is somewhat different, as it is given in a letter to a friend, which has been published by Mr. Adolphus.—'Single,' he there says, 'in a cabinet of my own forming, no soul in the house of lords to support me except two peers (Lords Denbigh and Pomfret), both the secretaries of state silent, and the lord chief justice, whom I brought myself into office, voting for me, yet speaking against me—the ground I tread upon is so hollow, that I am afraid not only of falling myself, but of involving my royal master in my ruin: it is time for me to retire.' His lordship's own powers of oratory were not such as to make up for the silence of his colleagues. He expressed himself with a deliberate pomposity of utterance, his words slowly dropping out at regular intervals, which the witty Charles Townshend used to call the minister's minute guns.

Though Lord Bute retired from office he still retained the confidence of the king; and he undoubtedly nominated his immediate successors. In the following August, also, when the sudden death of the earl of Egremont, one of the secretaries of state, again shook the new cabinet, he engaged in a negotiation, which came to nothing, with the view of bringing Lord Chatham into office. Lord Bute's continued influence, as supposed to be exerted behind the throne, was long a favourite topic of popular declamation; but certainly no proof of the fact was ever brought forward. We have heard on good authority, that not long after he ceased to be minister, the king one day met him in the gardens at Kew, and turned his back upon him.

According to Sir Egerton Brydges, in his edition of Col-

lins's 'Peerage.' Lord Bute 'passed the last six or seven years of his life in the most deep and unbroken retirement, principally at a marine villa, which he built on the edge of the cliff at Christchurch, in Hampshire, overlooking the Needles and the Isle of Wight. Here his principal delight was to listen to the melancholy roar of the sea.' 'He was more fond of the sciences,' it is added, 'than of works of imagination; but his favourite study was botany, on which he printed at his own expense a work in nine volumes quarto, of plates appertaining only to England. Only twelve copies were printed, of which the expense amounted to 10,000*l*.' Lord Bute had the merit of being a liberal patron of men of genius, both in literature and the arts. Among others, Dr. Johnson, and Home, the author of the tragedy of 'Douglas,' were indebted to him, the one for a pension, the other for a place. The architects George and Robert Adams, and Joshua Kirby, were all employed and munificently encouraged by him. The first part of Kirby's 'Perspective of Architecture' (published in 1761) contains the description and use of a new instrument, called the Architectonic Sextor, which is stated to have been invented by the Earl of Bute. He employed Robert Adams to build a splendid mansion for him at Luton Hoo, near St. Alban's, where he amassed a valuable library, and one of the richest collections of paintings, especially of the Dutch and Flemish schools, in the kingdom. (See a description of the library and gallery in the *Gentleman's Magazine* for 1817, Part 2nd.) He died at his house in South Audley-street, London, on the 10th of March, 1792. He had married in 1736, Mary, the only daughter of Edward Wortley Montagu, of Wortley, in Yorkshire: and by that lady, who eventually inherited a large fortune by the death of her brother, Edward W. Montagu, the traveller, he had seven sons and six daughters. His eldest son was, in 1796, created Marquess of Bute, in the British peerage.

BUTEA. [PTEROCARPUS.]

BUTESHIRE consists of the islands of Bute, Arran, Inehmarnock, and the Cumbraes, in the Frith of Clyde, on the W. coast of Scotland. [ARRAN.]

The island of Bute is about 6 miles from Ayrshire, and half a mile from Cowal in Argyshire. It is about 18 miles long and 4 or 5 in breadth. To the N. it is elevated, rocky, and barren; the central part is diversified by hills, valleys, and fertile tracts; and the S. end is hilly and divided from the rest of the island by a low and sandy plain called Langul-chorid. From Kilchattan Hill, in the S. district, there is an extensive prospect. The coast is rocky and indented by bays; the soil consists of clay, loam, and sand, with moss lying on gravel. The greater part of the arable land is inclosed and cultivated; barley, oats and potatoes are raised: turnips and artificial grasses have been introduced with success.

The minerals are limestone, freestone, slate, and some indifferent coal. Beds of coral and shells of considerable thickness are found in many places half a mile from the sea-coast. Rothesay, a small royal burgh on the N.E. coast at the bottom of an extensive bay, was formerly frequented by herring-boats, and it is now a favourite watering-place. The castle, which was sometimes inhabited by the kings of Scotland, and afterwards by the Bute family, was burnt in 1685 by the Marquis of Argyre, and is now in ruins. In former times there were 10 or 12 churches and 30 hermitages in this island. In the S. part of the island there is a place called the Devil's Cauldron, which is formed of stone without cement; the walls are now only a few feet in height and 10 in breadth; the area 30 feet in diameter: the object of the erection is unknown.

Inehmarnock, an island on the W. coast of Bute, about a mile in length, contains 120 acres of arable land and 340 of moor and pasture. Its minerals and agricultural products are the same as Bute: it was a seat of the Culdees.

The Cumbraes are two islands opposite the E. coast of Bute, and separated from Arrnringham, in Ayrshire, by a narrow channel called Fairly Road. Little Cumbrae is a mile long and half a mile broad. A lighthouse was erected on the highest part of the island, in 1750. Great Cumbrae, two miles from Ayrshire and three from Bute, is separated from Little Cumbrae by a channel three-quarters of a mile broad. It is about 2½ miles long and 1½ broad. The surface contains 2300 acres, a few of which are under cultivation. The village of Milnport has a convenient harbour, and is frequented as a watering-place. On the E. coast two rocks called Rippel Walls, distant from

each other 500 feet, and stretching in parallel lines across a plain, are composed of the same materials as the basaltic rocks at Staffa, but are not columnar.

By the Scotch Reform Act the burgh of Rothesay was made part of the county of Bute, which sends one member to parliament.

The population of Buteshire, in 1831, was 14,151. The island of Little Cumbrae was inhabited in 1831 by three families, those of a grazier or rabbit-catcher, a fisherman, and a lighthouse keeper, making in all 17 persons. More than 200 males, upwards of twenty years of age, are employed as weavers in the county of Bute: of these 90 are in the parish of Rothesay, 66 in Great Cumbrae, and 46 at Kilmory weave cotton goods in a wholesale manner, the intercourse of that place with Glasgow by steam-boats being cheap and rapid. Since 1821 the population of the parishes of Kilbride and Kilmory have respectively diminished 58 and 56 persons, owing to emigration to America. The enlargement of farms and removal of cotters has decreased the population of the parish of Rothesay 333 persons, while the influx of strangers has added to the burgh 710 persons.

From the returns from sheriffs in 1826, it appears that the number of schools in Buteshire was then two schools in the parish of Cumbrae, a parish-school containing eighty scholars, and a private one containing thirty-five; the private schoolmaster was supported by fees of 2*s*. 6*d*. per quarter for reading, and 3*s*. for writing, and by working at the looms during vacant hours. The parish schoolmaster was supported by school-fees, and a salary which amounted for the year ending 1835 to 30*l*. Gaelic and English have both been taught from time immemorial in the parish of Kilmory. It has five schools, attended by about forty pupils each; the teachers of each of which receive a portion of the salary. Besides these there are seven private; they are taught only during the summer and winter quarters, and their average attendance is about thirty-five. There are three teachers who have salaries on a legal provision in the parish of Kilbride; and besides these there are two other schools, to one of which there is a small salary attached. By the Scotch Reform Bill the borough of Rothesay was made part of the county of Bute.

BUTLER, CHARLES, was born in London of a Roman Catholic family in 1750. He was the son of Mr. James Butler, who was the youngest son of Simon Butler of Apple-tree, Northamptonshire: his mother's name was Grano. After receiving the rudiments of education at a Roman Catholic school at Hammersmith, he was sent to the English college at Douay, where, according to his own account, the scholars were excellently instructed in their religion, and the classics were well taught; 'but writing, arithmetic, and geography were little thought of, modern history was scarcely mentioned, and but small regard was paid to manners.' The discipline was somewhat ascetic, and its object was far more to qualify those trained under it to become obedient members of a particular church, than to be useful and active citizens of general society.

From Douay Mr. Butler removed to Lincoln's Inn, where he entered on the study of the law, and ultimately practised as a conveyancer: the remainder of his life may be comprised in the history of his numerous publications. He first appeared before the public anonymously, in an essay published in 1773, 'On Houses of Industry,' written at the request of Sir Harbord Harbord, afterwards Lord Suffield, and of a Mr. Chad, afterwards created a baronet. It chiefly related to the county of Norfolk, beyond which, as its author very modestly says of it, it obtained very little circulation. Five years afterwards he wrote a more important pamphlet 'On the Legality of Impressng Seamen.' It was favourably received, and procured for him the acquaintance of Lord Sandwich, at that time first lord of the admiralty, who wrote a few pages in the second edition, and of Wedderburne, then solicitor-general, and afterwards Lord Loughborough. The chief arguments and authorities were taken from the speech of Sir Michael Forster, in the case of Alexander Broadfoot, who was indicted for the murder of a sailor, being one of a party that endeavoured to impress him. So little original matter is added in the pamphlet to the arguments of Sir M. Forster, that Mr. Butler afterwards refused to admit it into the general collection of his works. In the following year Mr. Butler prepared a speech, which Lord Sandwich delivered in the House of Lords, in defence of his government of Greenwich Hospital; and about the same time, in conjunction with Mr. Wilkes, he appeared as an inquirer into the

authorship of Junius. A letter, including the results of their conversations, was printed without Mr. Butler's knowledge in the 'Anti-Jacobin Review,' and it is reprinted in his 'Reminiscences.' It rather disputes the claims of all the candidates who have been brought forward from time to time, than affirms the pretensions of any one of them. In the additional remarks made on the reprint in the 'Reminiscences,' Mr. Butler seems inclined to believe that Junius himself has never been detected: that he was of too high a rank to be bought, and that Sir Philip Francis was his amanuensis. Mr. Butler next engaged himself in the professional task of continuing and completing Mr. Hargrave's edition of 'Coke upon Littleton.' Eleven years had been employed by the first editor on half of the work. Four terms was the short period allotted to Mr. Butler for the execution of the remainder. The value of the original is well known to lawyers, but it perhaps is scarcely so well appreciated without the bar as it deserves to be. The following testimony may be little expected:—'It is very remarkable,' says Mr. Butler, 'that some English gentlemen, nowise connected with the profession of the law, beguiled their tedious exile at Verdun with a serious perusal of Coke upon Littleton, and have often spoken of the great mental delight which it afforded them.' Numerous editions of Coke upon Littleton followed at intervals during the life of Mr. Butler. To this work succeeded 'Horæ Juridicæ subsecivæ,' being a connected series of notes respecting the geography, chronology, and literary history of the principal codes and original documents of the Grecian, Roman, feudal, and canon law; an outline of very great use to the historian as well as to the lawyer. Mr. Butler also superintended a new edition of Fearn's 'Essay on Contingent Remainders,' and he contributed to Mr. Seaward's 'Anecdotes' an 'Essay on the Character of Lord Mansfield's Forensic Eloquence.' The 'Horæ Bibliæ' comes next, and is perhaps the most popular of all Mr. Butler's works. It had long engaged his thoughts, and a private edition of the first part had been printed before its completion in 1797. The first part professes to contain an historical and literary account of the original text, early versions, and printed editions of the Old and New Testaments; the second to embrace a similar account of the Koran, the Zend-Avasta, the Kings, and the Edda. It is free from party theological spirit, and it speedily run through five editions. In 1806 the great change in the constitution of the Austrian dominions induced Mr. Butler to draw up, chiefly from Anderson and Koch, a succinct history of the geographical and political revolutions of the German empire; and his pen, for the remainder of his life, was largely employed on subjects regarding his own church, which are collected in his general works. Among them are several biographies, drawn up with spirit and accuracy: lives of Bossuet, of Fenelon, of Abbé de Rancé, abbot of La Trappe, of St. Vincent of Paul, of Erasmus, of Grotius, of Henri Marie de Boudon, of Thomas à Kempis, of the Chancellor L'Hôpital, &c., and of his own uncle the Rev. Alban Butler, author of 'Lives of the Saints,' a work which Mr. Butler himself continued. The relief proposed to be given to the Roman Catholics in 1795 occasioned three books, written in conjunction with Joseph Wilkes, a Benedictine, and named, from the colour of their covering, the 'Blue Books.' It is needless to say that Mr. Butler was a strenuous advocate of Roman Catholic emancipation, and that much of the successful progress of that measure is to be attributed to the 'Historical Memoirs of the English, Irish, and Scottish Catholics,' 1819. Hitherto he had abstained from controversy, but the appearance of Dr. Southey's 'Book of the Church' engaged him in a series of letters to that writer, and afterwards in two replies to the present bishop of London, and to the Rev. George Townsend. They were written in a spirit of gentleness very seldom found in similar publications. The first volume of his 'Reminiscences,' chiefly containing the history of his literary life, was published in 1822, the second in 1827. They contain some very interesting details, but are expressed in the cramped style of most autobiographies. As a conveyancer Mr. Butler had full practice, and he was the first of his communion who was called to the bar after the Relief Act in 1791. He was afterwards made king's counsel. He married in early life, and left two daughters, one of whom married Andrew H. Lynch, Esq., of the Chancery bar, and the other Lieut. Col. Stonor. Mr. Butler died at his own house in Great Ormond Street, London, leaving behind him

an unblemished character and a considerable literary reputation, June 2, 1832. (Obituary in the 'Gentleman's Magazine,' Sept. 1832; *Reminiscences*.)

BUTLER, JAMES. (ORMOND, DUKE OF.)

BUTLER, JOSEPH, born at Wantage in Berkshire in 1692, was the son of Thomas Butler, a respectable shopkeeper, and a dissenter of the Presbyterian denomination. He received the rudiments of his education in the free grammar-school at Wantage, whence he was removed to the Dissenting Academy of Tewkesbury in Gloucestershire, then superintended by Mr. Jones, who had the singular fortune of having for pupils, with the view of being ordained to the Presbyterian ministry, three young men, afterwards prelates of the Established Church—Chandler, Butler, and Secker; the two latter were contemporaries. It was here that Butler gave the first proofs of the peculiar bent of his mind to abstruse speculation. Being dissatisfied with the argument *a priori* of Dr. Samuel Clarke in his 'Demonstration of the Being and Attributes of God,' he ventured, being then only in his twenty-second year, to express by a letter his doubts, and to offer his objections, to that acute writer. Dr. Clarke was for a time unacquainted with the name of his correspondent. The manner in which he replied to Butler's objections, and the fact of his publishing the letters in which they were conveyed, with his own answers, in subsequent editions of his work, sufficiently show that he felt the remarks of his youthful correspondent to be not without their weight.

About this time Butler was led to a more particular examination of the tenets of the religious body to which he belonged, the result of which, after some natural opposition from his father, accompanied with remonstrances from several respectable Presbyterian divines, was a secession from Presbyterianism, and a conformity to the Church of England. His views being thus changed, he entered Oriel College, Oxford, in March, 1714, and soon after was admitted into holy orders. While at Oriel he formed a friendship with Mr. Edward Talbot, the second son of Dr. Talbot, bishop of Durham, a circumstance to which he appears to have owed his subsequent promotion. In 1718 he was recommended by Mr. Talbot and Dr. Clarke to Sir Joseph Jekyll, Master of the Rolls, by whom he was appointed preacher at the Rolls. In 1721, on being presented by Bishop Talbot to the rectory of Haughton, near Darlington, he divided his residence between the Rolls and his parochial benefice. In 1723 he received Stanhope, one of the wealthiest but most retired rectories in England, from the same patron, in exchange for Haughton. In 1726 he resigned the Rolls' preachingship, and went to reside upon his rectory of Stanhope. In the same year he published a volume of fifteen sermons preached at the Rolls. These sermons are, upon his own acknowledgment, of a somewhat abstruse character, which arises as much from the method as from the scope of his argument, which is to demonstrate vice to be 'a violation or breaking in upon our nature.' He wished to show that man was formed for virtue, and that vice is a departure from his intended condition; to prove that religion and virtue were primarily natural to man; that they constitute order, whereas their opposite is disorder. Although his object might have been effected by the more direct proof that 'vice is contrary to the nature and reason of things,' he chose the other method, as 'in a peculiar manner adapted to satisfy a fair mind, and as more easily applicable to the several particular relations and circumstances in life.' The first three sermons are entitled, 'Upon Human Nature; or, Man considered as a Moral Agent.' That man is made for society, is evident from all we know of him; the very parts of his body show dependence one on another; and it is no wresting of words or of argument to carry the comparison further, and to show that mankind in general is a body made up of a number and variety of members, like the natural body. As it is the office of his own several component parts, or members, each to assist and benefit the others, so it is the duty of each member of society to promote the general welfare; and any deviations from this rule, which is in fact a rule of nature, have been the deviations of ignorance and sin. The author establishes his point by three proofs. First, there is in man a natural principle of benevolence, which is, in its degree to society, what self-love is to the individual; and that there is such a principle, appears from the existence and operation of those feelings, which are called affections. Are we not inclined to love, to friendship, to compassion? That we are thus inclined in any degree is enough for the

purpose. It matters not how narrow and obscure these feelings are. If they exist at all, they 'prove the assertion, and point out what we were designed for.' Secondly, there are several affections or passions distinct both from benevolence and self-love, which in general contribute and lead us to public good as really as to private. Thirdly, there is a principle of reflection, by which men approve or disapprove of their own actions; this is conscience, which faculty tends to restrain men from doing mischief to one another, and leads them to do good. That man has evil dispositions is no objection to this mode of argument, for his ungoverned passions incline him to act against his own interests, as well as against the interests of others. The pure nature of man then would lead him to right conduct in society, or what we denominate virtue. To understand the purpose of a being, we must ascertain the bent of his *true* nature: and, where the true nature is known, there can be no difficulty. The illustration used is that of the eye. The eye is designed for vision; and, as we are not to judge of first design from any state of defect into which it may have casually fallen, neither are we to judge of the true nature of man from any present perversion of inclination; and the objection to his argument, 'that nature is that to which any man is most inclined, and that the following of nature is but a following of inclination, which may be different in different individuals,' is answered by an explanation of the term. 'By nature,' he says, 'is often meant no more than some principle in man, without regard either to the kind or degree of it.' This however is manifestly wrong; for the same person may have contrary principles, driving or urging him contrary ways. Again, 'Nature is frequently spoken of as consisting in those passions which are strongest, and most influence the actions.' This is wrong too. Men are certainly *now* vicious, as it were, by nature; but they are so because their nature is deteriorated, and the argument refers to the original and pure nature. In neither of these senses is man's primary nature to be received, because, to follow nature in either of them, would be a wandering from the original design, and a following of what had become faulty. The text of the second sermon shows the meaning in which the word nature ought to be used. 'For when the Gentiles which have not the law, do by nature the things contained in the law, these having not the law are a law unto themselves. Which show the works of the law written in their hearts, their consciences also bearing witness, and their thoughts the meanwhile accusing or else excusing one another.' Conscience makes man a moral agent. It justifies and it condemns. It cannot justify what is wrong; it cannot condemn what is right; right, therefore, is natural to man, and determined by the testimony of conscience alone. After establishing the supremacy of conscience, he forms his notion of human nature, in the following of which virtue is said to consist, and the deviation from which is vice. 'As the idea of a civil constitution implies in it united strength, various subordinations, under one direction, that of the supreme authority, the different strength of each particular member of the society not coming into the idea; whereas, if you leave out the subordination, the union, and the one direction, you destroy and lose it: so reason, several appetites, passions, and affections prevailing in different degrees of strength, is not *that* idea or notion of *human nature*; but *that nature* consists in these several principles considered as having a natural respect to each other, in the several passions being naturally subordinate to the one superior principle of reflection or conscience. Every bias, instinct, propension within, is a real part of our nature, but not the whole. Add to these the superior faculty, whose office it is to adjust, manage, and preside over them, and take in this its natural superiority, and you complete the idea of human nature.' A deviation from it, or its violation, he thus defines: 'And as in civil government the constitution is broken in upon and violated by power and strength prevailing over authority, so the constitution of man is broken in upon and violated by the lower faculties or principles within prevailing over that which is in its nature supreme over them all. Man indeed cannot be considered as left to himself, to act as present inclination may lead him: the very ability of putting the question, *Is this I am going about right, or is it wrong? Is it good, or is it evil?* implies an obligation to act rightly, for it shows that he has a natural conception of right. The objection, *'Why should we be concerned about anything out of and beyond ourselves?'* is thus removed.

Are we, or can we be, indifferent to disgrace, neglect, or contempt? Man is by nature disposed to action; and upon comparing some actions with this nature, they appear suitable and correspondent to it: from comparison of other actions with the same nature, there arises to our view some unsuitableness or disproportion. Those which are most suitable to it are the law or design of nature; and that which promotes real happiness, or the true purpose of nature, is virtue.

These sermons contain the germ of those principles of analogy which were afterwards developed by the author in a separate work; when viewed in all their parts and bearings, they must be considered as one of the most successful attempts to explain the true nature of man as a moral agent, and to discover the springs of human action. It has been observed by a recent writer (Austin, *The Province of Jurisprudence determined*, p. 109), 'In so far as I can gather his opinion from his admirable sermons, it would seem that the compound hypothesis (that is, the hypothesis compounded of the hypothesis of utility, and the hypothesis of the moral sense) was embraced by Bishop Butler. But of this I am not certain: for, from many passages in those sermons, we may infer that he thought the moral sense our only index and guide.' In this remark we concur: in several passages Butler seems to consider the moral sense as that by which we judge of the character of actions, and yet there are other passages which appear to prevent us from adopting this conclusion.

It is unnecessary to analyse the other admirable discourses: that on the government of the tongue is a masterpiece of its kind; and the sermons on resentment and forgiveness of injuries are equally remarkable for the profound insight into the principles by which human society is held together, and for their practical utility.

To this volume, in a later edition, he appended six other sermons, preached on certain public occasions. One of these sermons (the fourth) is well calculated to meet certain objections that have been made to the education of the poor.

His residence at Stanhope continued until 1733, when he was drawn from his retirement by being appointed chaplain to Lord Chancellor Talbot. About the same time he was presented by his patron to a prebend in the church of Rochester. This was done through the interposition of his friend and fellow-pupil Secker, who was anxious for his re-appearance in the world, and wished to see him in some more conspicuous station than the rectory of Stanhope. Secker, having taken occasion to mention him to Queen Caroline, her Majesty remarked that she thought he was dead; and, not satisfied with his assurance to the contrary, she inquired of Archbishop Blackburne, who replied, 'No, madam, but he is buried.' In 1736 Butler was appointed clerk of the closet to the queen, upon whom he was in constant attendance until her death in the following year. So highly indeed did she esteem him that she required his presence two hours every evening. He had lately produced his great work, 'The Analogy of Religion, Natural and Revealed, to the constitution and course of Nature,' which he had presented to her Majesty before publication, and which he dedicated to the Lord Chancellor Talbot, 'in acknowledgment of the highest obligations to the late Lord Bishop of Durham, and to himself.' In this work it was his aim to demonstrate the connexion between the present and a future state, and to show that there could be but one author of both, and consequently one general system of moral government by which they must be regulated. Of this admirable work it has been justly observed, 'Upon the whole, as our author was the first who handled the argument in proof of religion from analogy in a set treatise, he has undeniably merited the character of a first discoverer; others indeed had occasionally dropped some hints and remarks of the argument, but Dr. Butler first brought it to a state of perfection. The treatise contains the finishing and completion of that way of reasoning, the foundation whereof was laid in his sermons.' The year after the death of Queen Caroline he was made bishop of Bristol; and in 1740 he was presented to the deanery of St. Paul's, on which occasion he resigned the rectory of Stanhope. One of his first acts of patronage was to bestow on his old master, Mr. Barton, master of the school at Wantage, the rectory of Hutton in Essex. Butler was always liberal in the expenditure of his money; he laid out on the episcopal palace of Bristol 4000*l.*, and he was a munificent benefactor to charitable institutions. In 1746 he was appointed clerk of

the closet to the king; and in 1750 was translated to the see of Durham, vacant by the death of Dr. Edward Chandler, who had also been a pupil, as already mentioned, at the academy at Parkersbury. The short time that he held this see allowed him to make only one visitation of his diocese. The charge which he delivered to his clergy on that occasion subjected him to much animadversion. He had begun by lamenting the general decay of religion, and noticed it 'as a complaint by all serious persons.' As an aid in remedying this evil he recommended his clergy to 'keep as well as they were able the form and face of religion with decency and reverence, and in such a degree as to bring the thoughts of religion often to the minds of the people; and to endeavour to make this form more and more subservient to promote the reality and power of it.' He insisted that although the form might and often did exist without the substance, yet that the substance could not be preserved among mankind without the form. He instanced the examples of heathen, Mohammedan, and Roman Catholic countries, where the form had been very influential in causing the superstition to sink deeply into the mind; and he inferred that true religion would, by the same rule, sink the more deeply with such aid into the minds of all who should be serious and well disposed. These observations, which, like all the remarks of this profound thinker, show an intimate acquaintance with human nature, were strongly censured as savouring of popery, and he was particularly attacked in a pamphlet entitled 'A Serious Inquiry into the use and importance of External Religion, occasioned by some passages in the Right Reverend the Lord Bishop of Durham's Charge to the Clergy of that Diocese.' The very sentence in which he says that the form is to be made 'subservient to promote the reality and the power,' ought to have been sufficient to protect him. Bishop Butler did not long enjoy his last preferment. His health rapidly declined, and he died at Bath on the 16th of June, 1752, and was buried in Bristol cathedral. His writings, though not numerous, are sufficient to show the extent of his knowledge, the solidity of his judgment, and the great powers of his mind. His statement of a question is fair and candid, his reasoning is close and sincere, and his conclusions nearly always just and convincing. His piety was unostentatious but fervent, with something from natural disposition and the grave direction of his studies approaching to gloom. A man whose thoughts were so seriously employed, whose inquiries were of so abstruse a character, could hardly be otherwise. Still 'no man ever more thoroughly possessed that meekness of wisdom which the apostle enjoins; he had noticed the expression for its beauty; his heart and disposition were conformed to it, and in high as in humble life it was uniformly manifested in his conversation. Neither the consciousness of intellectual strength, nor the just reputation which he had thereby attained, nor the elevated station to which he had been raised, in the slightest degree injured the natural modesty of his character, or the mildness and sweetness of his temper.' His intercourse with clergy and laity was open and free; his income he considered to belong to his station, and not to himself; and so thoroughly was this feeling of his understood that his relatives never indulged the expectation of pecuniary benefit from his death. It was his remark, on his promotion to Durham, 'It would be a melancholy thing in the close of life to have no reflections to entertain oneself with, that one had spent the revenues of the bishopric of Durham in a sumptuous course of living, and enriched one's friends with the promotions of it, instead of really having set oneself to do good, and to promote worthy men.' It has already been stated that he was accused of a disposition to popery, in consequence of some expressions in his charge to the clergy of Durham. This charge was repeated by an anonymous writer fifteen years after his death, and was made to rest chiefly on the circumstance of his having put up a cross in the episcopal chapel of Bristol. It was also asserted that he had died in communion with the church of Rome. His friend Secker, at that time archbishop of Canterbury, satisfactorily disproved the charge. He did not deny that the bishop had erected the cross, but this, he contended, was no manifestation of popery; it was merely as an emblem and a memorial of the Christian faith. With respect to his having died in communion with the church of Rome, the circumstance was not even hinted at until fifteen years after his death; and it is clearly shown, by the testimony of those who

attended him in his last illness, that there is no truth in the statement. Bishop Butler was never married. His works are collected in two volumes 8vo., which have been several times reprinted.

BUTLER, SAMUEL, was born at Strensham, in Worcestershire, about 1612, and educated in the Free School at Worcester. The finances of his father, who was a small farmer, would not allow him to be matriculated at Cambridge, to which university he desired and his proficiency in learning entitled him to proceed. Accordingly he engaged as clerk to Mr. Jeffereys, an eminent justice of the peace, of Carlscroome, in his native county. Here in his leisure hours he employed himself in studying history, poetry, music, and painting; some specimens of his skill in the last-named art existed not long since, and it is said were not worth preserving. We know not how he afterwards obtained an introduction to Elizabeth Countess of Kent, but under her patronage he had access to a well-stocked library, and enjoyed the conversation of the learned Seiden. He entered afterwards into the service of Sir Samuel Luke, a knight of ancient family in Bedfordshire, who had been one of Cromwell's commanders, and is supposed to have been the prototype of the character of Hudibras. After the Restoration he became secretary to Richard Earl of Carbury, Lord President of the Principality of Wales, who, on the revival of the court of the Marches, made him steward of Ludlow Castle, soon after which he married Mrs. Herbert, a gentlewoman of good family, whose fortune was lost to him by being invested in bad securities. It is also said that he was secretary to the second George Villiers, Duke of Buckingham, when he was chancellor of Cambridge. With that nobleman, with the Earl of Dorset, and with many other wits of the time, he certainly lived on terms of familiar intercourse; yet he died, as is believed, in great poverty in 1680, and was buried in the churchyard of St. Paul's, Covent Garden, at the expense of his friend Mr. William Longueville, a bencher of the Inner Temple, who, according to common report, rescued him from absolute starvation, and after his death became possessed of his papers.

The first part of Hudibras, containing three cantos, was published in 1663, and soon became eminently popular, and was much quoted even at court. In the next year appeared the second part. The third part, which does not bring the poem to a conclusion, was not published till 1678. Three small volumes of posthumous works were published, as Johnson says, 'I know not by whom collected or by what authority ascertained.' Two more, undoubtedly genuine, were afterwards printed by Mr. Thyer of Manchester. Some of his posthumous poems are very obscene.

Such is the scanty record of perhaps the most witty writer in our language. 'The events of his life,' says his biographer whom we have already cited, 'are variously stated, and all that can be told with certainty is that he was poor. On a work so well known as Butler's Hudibras it is scarcely necessary to make a single remark. Voltaire has well said of it that it unites the wit of Don Quixote with that of the Satyre Menippe. Hudibras, the hero, is a Presbyterian justice, who, fired with the same species of madness as the Don Quixote of Cervantes, undertakes the reform of abuses, in company with his Squire Ralph, an Independent clerk, with whom he is almost always engaged in controversy. This union of the knight errant and the Presbyterian is faulty in the outset, and in the conduct of the poem there is little to satisfy the reader. The adventures are tiresome and tedious, but the dialogues are carried on with a strain of wit which appears to be exhausted. The characters which were before the eyes of our forefathers have passed away, but so great was Butler's knowledge of human nature, that many of his distinctions have proved proverbial. However easy may appear the style of the poem, which he has adopted, and however frequently his far course has been followed after him, it is not among the least proofs of Butler's extraordinary excellence that he is about a rival among his imitators. The standard edition was published in 1744 in two vols. 8vo., with laboriously illustrative notes by Dr. Grey. In 1721 John Barber, citizen and one time Lord Mayor of London, erected a cenotaph in Westminster Abbey to Butler's memory, which provoked a just epigram from Samuel Wesley, and a sonnet, which appears to have been little merited, from Pope.

BUTOMACEÆ, a natural order of Endogens, the type of which is the *Butomus umbellatus*, a common water-

plant of this country. It is vulgarly called the Flowering Rush, and is accounted the handsomest herbaceous plant of the British Flora. Butomaceæ are easily characterised by being tripetaloidous endogens (that is, with three sepals distinct in size and colour from the three petals) with several carpels, the whole lining of which is covered with seeds. This simple circumstance cuts them off from Alismaceæ, with which they were once associated, and also distinguishes them from all other monochlamydeous orders. The order is a very small one, not containing more than three known genera, and about half a dozen species, natives of equinoctial America, exclusive of the *Butomus umbellatus* of England and another species of the same genus occurring in Nepal.

[*Butomus umbellatus*.]

1, a section of a portion of a leaf; 2, an entire flower; 3, the carpels; 4, the style; 5, a separate carpel; 6, a transverse section, showing how the whole lining of the ripe carpels is covered with seeds; 7, a seed much magnified; 8, a longitudinal section of the same; 9, a seed germinating; 10, the same in a more advanced state; 11, the cotyledon; 12, the plumule sprouting; 13, the radicle just bursting through its integuments. (N.B. This offers an illustration of the eudormical mode of germination.)

Butomus umbellatus is a rush-like plant with three-cornered sword-shaped leaves, and umbels of handsome rose-colored flowers, containing nine stamens, a peculiarity by which it is immediately recognised among other wild flowers. The root of it are regarded in Russia as a specific in hydrophobia, but experiments made with them in this country have not confirmed the accounts of their influence in this utterly incurable disease recorded by the Russian physicians.

BUTOOL, a small district of the province of Oude on the E. frontier adjoining to Gorkha, in which country the village of Butool, from which the district derives its name, is in fact situated. This village stands at the foot of a range of hills on the right bank of the river Tenavy, in 27° 37' N. lat. and 83° E. long. and rather more than 60 miles N. from Goruckpore. It was clearly established by the British in the discussions which led to the treaty with the Gorkhas of 1815, that the village of Butool had never rightly formed part of the dominions of Oude, and its possession was consequently ceded to them by the British. The village is extremely unhealthy, and on this account is nearly deserted during the rainy seasons. The lands which form the present district of Butool, and which were proved to have belonged to the nabob of Oude, are consequently now at British possessions: their annual value was stated in 1815 at 40,000 rupees.

BUTHROTUM, Buthrotum, an ancient town, now ruined, on the coast of Epirus, on the northern narrow part of the channel which divides the island of Corfu from the mainland. It stood on a hill surrounded by marshy ground, and forming a sort of peninsula at the entrance of the harbour Pelodæ, nearly opposite the promontory of Leucimne in the island of Corfu. (Strabo, vii.) Virgil calls it 'lofty Buthrotum' (*Æneid* iii.), where he makes Æneas

meet Helenus the son of Priam, who ruled over the country of the Chaonians after the death of Pyrrhus the son of Achilles. (Justin, xxi.) After the conquest of Epirus by the Romans, Buthrotum became a Roman colony. Pomponius Atticus had an estate near Buthrotum, where he spent great part of his time; and both he and Cicero interested themselves in favour of the Buthrotians, whose lands had been confiscated and given away to fresh colonists during the civil war. Atticus wrote to Cæsar on the subject, and he paid out of his own pocket part of the fine due by the Buthrotians, upon which Cæsar reversed the sentence. After the death of Cæsar the affairs of the Buthrotians was still in agitation, and we find Cicero writing to the Prætor Plancus and others in their favour. (*Epist. ad Attic.* xvi. 16.) Under the Byzantine empire, Buthrotum was a bishop's see suffragan to the archbishop of Lepanto. It was afterwards ruined, probably at the Turkish invasion. The Venetians, in their wars with the Turks, settled on this coast, and built a square fort at the foot of the hill on the sea-side, where they kept a garrison to protect their fisheries. Butrinto and Parga were dependencies of the Venetian government of Corfu. The Venetian writers of the last century speak of the ancient town of Buthrotum as completely ruined, and they mention statues, pillars, medals, and cameos as found in digging the ground. They represent the country as marshy and unwholesome, and almost desert, and abounding with game. The little river Paula, issuing out of the marshes of Butrinto, empties itself into the sea. (*Topographia Veneta*; Coronelli, *Atlante Veneto*.) In 1797, after the fall of the Venetian republic, the French put a garrison in the fort of Butrinto, but in the following year Ali Pasha drove them from that as well as from the other Venetian strongholds on the coast of Albania, which were re-annexed to the Turkish dominion.

BUTTER. The preparation of butter is an important part of rural economy. When salted it is extensively used as provision for domestic use and in the victualling of ships, and is a considerable article of commerce. Butter is the fat or oleaginous part of the milk of various animals, principally of the domestic cow. The milk of the cow is composed of three distinct ingredients, the curd, the whey, and the butter; the two first form the largest portion, and the last the most valuable. The comparative value of the milk of different cows, or of the same cows fed on different pastures, is estimated chiefly by the quantity of butter contained in it; and in this respect some breeds of cows are far superior to others. The union of the component parts of milk is chiefly mechanical, as they separate by subsidence according to their specific gravities, the cream being the lightest, and the curd the heaviest; the curd however requires a slight chemical change for its separation from the whey, which at the same time produces a peculiar acid called the lactic acid. From the moment that milk is drawn from the cow it begins to be affected by the air and changes of temperature, and circumstances almost imperceptible to our senses will, materially affect its quality. Hence the importance of extreme care and attention in every step of the process of the dairy, especially in making butter.

The cows should be milked in the cool of the morning and evening; they should not be much driven immediately before milking, and it is best to bring them to the place of milking some time before the operation begins. In some situations it is better to milk them in the pastures and carry the milk home; in others to drive the cows gently to the cow-stall. In mountainous countries the first mode is generally adopted, because the cows are apt to leap down steep places, and shake the milk in their udder more than is done by carrying it in the pail. The same practice holds good in Holland from another cause, which is, the distance of the pastures from the home-stall, and the facility of transporting the milk in small boats, all the best pastures being surrounded by small canals communicating with the greater; so that the milk may be carried several miles without the least agitation. In England, where the pastures frequently surround the habitation of the dairyman, the cows are generally driven home twice a day to be milked. As the slightest acidity or putrescence immediately causes an internal chemical action in milk, it is of the greatest importance that the place where the cows are milked, and the persons employed should be of the greatest purity and cleanliness. The milking-house should be paved with stone or brick, and no litter or dung be permitted

to remain in it. It should be washed out twice a day, immediately before each milking; which, besides ensuring cleanliness, produces a refreshing coolness highly useful to the milk. The teats of the cows should be washed clean with water and a sponge. The vessels in which the milk is drawn from the cow should be made of very clean white wood; they should be scalded immediately after having been used, and then exposed to the air, so as to be perfectly dry by the next time of using them. Tin or copper vessels are preferable to wood, because they are not so easily tainted, and are more easily kept clean. Where these are used they should always be kept bright within and without, by which means the least speck of dirt is immediately discovered.

The milk as soon as it is brought into the dairy is strained through a fine sieve or cloth, in order to remove any extraneous matter, and it is then poured into shallow pans, or troughs lined with lead. The best pans are of metal, either of iron carefully tinned, or of brass. Such pans are cool in summer, and in winter allow of the application of heat, which is often very useful to make the cream rise. When leaden troughs are used they are generally fixed to the wall, and have a slight inclination towards one end, where there is a hole with a plug in it, by drawing which the thin milk is allowed to run off slowly, leaving the cream behind, which runs last through the hole into the pan placed under to receive it. The milk in the pans or troughs is generally four or five inches in depth, which is found most conducive to the separation of the cream. The place where the milk is set should have a thorough draught of air by means of opposite wire windows. The sun should be carefully excluded by high buildings or trees, and the floor, which should always be of brick or stone, should be continually kept moist in summer, that the evaporation may produce an equal cool temperature. A small stove in winter is a great advantage, provided smoke or smell be most carefully avoided, and the temperature be carefully regulated by a thermometer. All these minutiae may appear superfluous to those who have no practical knowledge of the dairy, and many dairymen, who cannot deny the truth of what we have stated, may excuse their deviation from these rules by saying, that good butter is made without so much care and trouble. This may be true, but they cannot ensure good butter at all times; and when cleanliness and order are brought to a regular system the trouble disappears. It is well known that even the complexion and temperament of a dairy-woman are not a matter of indifference; and that however clean she may be, there are times when the insensible perspiration of her body will have a powerful effect on the milk. In Switzerland men are chiefly employed to milk the cows, and in all the process of the preparation of butter and cheese. The women only clean the utensils, and carry green food to the cows when they are kept in the stable. When the milk has stood twelve hours the finest parts of the cream have risen to the surface, and if they are then taken off by a skimming dish, and immediately churned, a very delicate butter is obtained; but in general it is left twenty-four hours, when the cream is collected by skimming, or the thin milk let off by taking out the plug in the troughs. All the cream is put into a deep earthen jar, which should be glazed, but not with lead: stone ware is the best. More cream is added every day till there is a sufficient quantity to churn, which in moderate dairies is every two days. It is usual to stir the cream often, to encourage a slight acidity, by which the process of churning is accelerated. This acidity is sometimes produced by the addition of vinegar or lemon-juice; but however this may facilitate the conversion of the cream into butter, we would not recommend it, as the quality is decidedly injured by it, especially butter which is to be salted. It has been asserted by some authors that butter will not separate from the butter-milk until acidity is produced, and, no doubt, there is more or less of lactic acid in all butter-milk: but perfectly fresh cream, which has stood only one night and is churned early next morning, will generally produce excellent butter in a quarter of an hour or twenty minutes in summer, and no acid taste can be discovered in the butter-milk. The change by which the butter is separated in a solid form is accompanied by the development of heat in churning. That the state of the atmosphere with respect to electricity as well as the temperature has a powerful influence on the making of butter, no one can doubt who has paid any attention to the effect of a thunderstorm in a dairy, especially when it

occurs at the time of churning. As science becomes gradually applied to all the common arts of life some accurate experiments will probably be made to throw light on this subject, and an electrometer may be found as useful in a dairy as a thermometer is already.

The common method employed to separate the butter from the thinner portion of the cream is by strong agitation. In small quantities this may be done in a bottle; but the common instrument is the *churn*, which is a wooden cask rather wider at bottom than at the top, covered with a round lid with a hole in the centre. Through this hole passes a round stick about four feet long inserted in the centre of a round flat board with holes in it: the diameter of this board is a little less than that of the top of the churn. Various improvements have been made on this machine. The cream should not fill above two-thirds of the churn. By means of this stick held in both hands and moved up and down, the cream is violently agitated, passing through the holes in the board and round its edge every time the stick is raised or depressed, and thus every portion is brought into contact with the air. In the course of an hour's churning, more or less according to circumstances, small kernels of butter appear which are soon united by the pressure of the board against the bottom of the churn, and form a mass of solid butter. The butter is collected with the hand, and placed in a shallow tub for the next operation. The butter-milk is set aside for the pigs, or for domestic use. The butter is still mixed with some portion of butter-milk, but much of its quality for keeping depends on their perfect separation. The most usual way is to spread it thin in a shallow tub, beating it with the hand or a flat wooden spoon, and washing it repeatedly with clear spring water until all milkiness disappears in the water which is poured off. Some experienced dairymen pretend that the butter is deteriorated by much washing, and therefore express the butter milk by simply beating the butter with the hand, kept cool by frequently dipping it in cold water, or with a moist cloth wrapped in the form of a ball, which soaks up all the butter milk, and leaves the butter quite dry. This operation requires the greatest attention, especially in warm weather, and no person should work the butter who has not a very cool hand. The less it is handled the better, and therefore a wooden spoon or spatula is much to be preferred.

When it is entirely freed from the butter-milk and of a proper consistency, it is divided into portions of the weight required, if it is intended to be sold fresh. The mode of preparing fresh butter for the market is either by making it into *rolls* of two pounds, or into flat round *cakes* of one pound or half a pound each, which are impressed with some figure cut in a round piece of wood like a large seal, hence called *prints*. The rolls are made oblong with four sides slightly flattened by throwing the lump on a stone or board successively on each of the four sides, and then on the two ends. This requires some dexterity, which is soon acquired, and it is done to avoid unnecessary handling.

To make prints the butter is first made into balls, and then applied by pressure to the wood, which makes the impressions: the sides are trimmed up along the edge of the wood, and the whole is pressed against a marble or wooden slab, so as to have the impression uppermost, and form a flat cake. The wooden print is readily detached by holding it in the left hand, and giving a smart blow with the right upon it. A hole, bored through the centre, prevents the adhesion of the butter from the exclusion of the air. In Cambridgeshire butter is made up into rolls a yard long, and passed through a ring of a certain diameter, for the convenience of dividing it into small portions without the trouble of weighing. Hence the butter is said to be sold by the yard.

The greatest portion of the butter that is made, especially at a distance from large towns, is immediately salted and put into casks, which usually contain fifty-six pounds, and are called *firkins*. The quality of the salt used is of great importance; if it be pure, the butter will keep its flavour for a long time, but when it is impure and contains bitter and deliquescent salts the butter soon becomes rancid. The Dutch are very particular in this point. They use a kind of salt which is made by slow evaporation, and perfectly crystallized. The salt is intimately mixed with the butter. From 3 to 5 lbs. are sufficient for a firkin of 56 lbs.* The

* The following mixture has been found superior to salt alone in curing butter:—half an ounce of dry salt pounded fine, two drams of sugar, and two drams of saltpetre, for every pound of butter.

casks are made of clean, white wood. They are carefully washed inside with strong brine made hot, and rubbed over with salt. The butter being quite dry is pressed close into the cask, a small layer of salt having been first put on the bottom. Every addition is carefully incorporated with the preceding portion. If there is not a sufficient quantity to fill the cask at once, the surface is made smooth, some salt is put over it, and a cloth is pressed close upon it to exclude the air. When the remainder is added, at the next churning, the cloth is taken off, and the salt, which had been put on the surface, carefully removed with a spoon. The surface is dug into with a small wooden spade, and laid rough, and the newly-salted butter is added and incorporated completely. This prevents a streak, which would otherwise appear at the place where the two portions joined. When the cask is full some salt is put over it, and the head is put on. If the butter was well freed from all the butter-milk, and the salt mixed with it quite dry, it will not shrink in the cask, and it will keep its flavour for a long time. Should there be an appearance of shrinking, the cask must be opened, and melted butter poured round it so as to fill up the interstices between the butter and the cask; in this way it will not suffer in its quality. There is a mode of preserving butter for domestic use without salt, in the following manner:—the butter is set in a clean pan over the fire and melted very gently; it is not allowed to boil, but is heated very nearly to the boiling point. Experience has shown this heat to be attained when the reflection of the white of the eye is distinctly seen on the surface of the butter on looking down into the pan. All the watery particles are then evaporated, and the curd, of which a portion always remains in the butter, and which is one cause of its becoming rancid, falls to the bottom. The clear butter is poured into an earthen vessel and covered over with paper, and a bladder or a piece of leather is tied over the jar to exclude the air. When it is cooled it much resembles hogs lard. It has lost some of its flavour, but it is much superior to salt butter for culinary purposes, and especially for pastry.

The Devonshire method of making butter differs materially from the common process which we have described, and is peculiar to that county. The milk, instead of being set for the cream to rise, is placed in tin or earthen pans, holding about eleven or twelve quarts each. Twelve hours after milking these pans are placed on a broad iron plate, heated by a small furnace. The milk is not allowed to boil, but a thick scum rises to the surface. As soon as small bubbles begin to appear, where a portion of this is removed with a spoon, the milk is taken off and allowed to cool. The thick part is taken off the surface, and this is called *clouted cream*. It is a sweet pleasant substance, more solid than cream, but not so solid as butter; and is considered as a dainty by all those who have been early accustomed to it. A very slight agitation converts it into real butter; after which it is treated exactly as we have before described. It does not appear that there is any peculiar advantage in the Devonshire method.

Another method of making butter, which is more generally adopted, is to churn the milk and cream together. This method is pursued in parts of Holland, Scotland, and Ireland, and is said to produce a greater abundance of butter from the same quantity of milk. In the Dutch method the milk is put into deep jars in a cool place, each *meal*, or portion milked at one time, being kept separate. As soon as there is a slight appearance of acidity the whole is churned in an upright churn, which, from the quantity of milk, is of very large dimensions. The plunger is therefore worked by machinery moved by a horse, or sometimes by a dog walking in a wheel, which he turns by his weight. When the butter begins to form into small kernels, the contents of the churn are emptied on a sieve, which lets the butter-milk pass through. The butter is then formed into a mass, as described before. In Ireland the process is very similar, but the milk is allowed to arrive at a greater degree of acidity, which is a defect.

In Scotland the following method is pursued: the milk is allowed to cool for six hours, and then put into a clean vat. As long as it remains sweet more milk may be added, but not after any acidity is produced. It is then covered and allowed to get sour, till it coagulates at the top; this coagulum is called the *lapper*, which must not be broken till the butter is churned. When the clotted milk is put into the churn, warm water is added so as to raise the temperature to 70° or 80°, the whole being gradually stirred in. When

this is properly conducted the butter-milk will be very pleasant and wholesome, with a sub-acid taste, the serum and curd not being separated from each other for some time after. The butter is said to be fully equal to that made from cream alone. (*Quarterly Journal of Agriculture*, December, 1834.)

Butter is a most valuable article of commerce, and a great source of wealth to those nations which produce it in the greatest perfection. The Dutch have hitherto had the pre-eminence: but there is no good reason why the rich pastures in England and Ireland should not produce as good butter as those of Holland, if sufficient attention were paid to the minutiae of the dairy, to the purity of the salt used, and especially to cleanliness, for which the Dutch are so remarkable. The quality of the butter depends on some very minute circumstances, which escape the notice of all superficial observers. The smallest particle of putrescent matter, accidentally added, and even mere cilluvia, give a turn to the chemical action going on from the moment the milk is exposed to the air, and they taint the cream more or less. The quantity of pure cream which rises when the milk is set in the pans, as well as its quality, is influenced by these circumstances. When the milk curdles before the cream is separated, it is almost impossible to prevent some portion of the curd being mixed with the butter. In its perfectly fresh state the taste is not affected by this; but the butter will not keep fresh above twenty-four hours, and when salted soon becomes rancid. Thus a greater quantity is produced, but of inferior quality. When cheese is made of the milk from which the cream has been taken, it will be found most profitable not to attempt to take off all the cream by repeated skimming; for more will be gained in the better quality of the cheese, than by an increase in the quantity of the butter, at the expense of the quality.

It is an acknowledged fact, that such are the niceties of the dairy, that great experience alone can ensure a produce of superior quality, and this experience would be more readily acquired if the circumstances were accurately observed and noted. We would recommend to those who have extensive dairies to mark by the thermometer the temperature of the milk and cream in the different stages of the process: occasionally to test the acidity of the butter-milk by means of alkalis; and to note any peculiarity in the atmosphere by an electrometer. A few observations carefully noted, repeated, and compared, would throw more light on the true causes which favour or oppose the production of good butter, than all the guesses that have hitherto been made.

The quality of the butter depends materially on the nature of the pasture. The best is made from cows fed in rich natural meadows. Certain plants which grow in poor and marshy soils give a disagreeable taste to the butter. The common notion that the yellow flower called the buttercup gives colour and flavour to butter is a mistake: cows never crop the flower if they can avoid it, and the whole plant is hard and unpalatable. When cows are fed with cut grass in the stable the butter is inferior, except in the case of some artificial grasses, such as lucerne. Turnips and other roots given to cows in winter communicate more or less of a bad taste to butter, which is corrected in some degree by means of a small quantity of water and saltpetre added to the milk; and also, it is said, by giving salt to the cows with their food. But there is no butter made in winter equal to that which is made where the cows are fed entirely with good meadow hay, especially of the second crop, called after-math hay, which contains few seed-stalks. [AFTERMATH]

The yellow colour of fine May butter is frequently imitated artificially by mixing some ground annotta root, or the juice of carrots, with the cream. This is easily detected by the taste of the butter, which is not improved by it, and has not the peculiar flavour of fine grass butter; but in other respects it is a harmless addition. Some cows give a much yellower cream than others, especially the Alderney cows; and the butter made from it is of a peculiarly fine flavour. When a cow has lately calved the milk is also much yellower, but this soon goes off, if it be not the natural colour; and the butter made by mixing this with other milk, although of a deeper colour, is not improved by it.

According to the accounts of the produce of butter from different countries and various breeds of cows, we may state that, on an average, four gallons of milk produce sixteen ounces of butter; and to make the feeding of cows for the dairy a profitable employment in England, a good cow

should produce six pounds of butter per week in summer, and half that quantity in winter, allowing from six weeks to two months for her being dry before calving; that is, 120 lbs. in twenty weeks after calving, and 80 lbs. in the remainder of the time till she goes dry, - in all about 200 lbs. in the year. If she produces more she may be considered as a superior cow, if less she is below par. To produce this quantity the pasture must be good, and if we allow three acres to keep a cow in grass and hay for a year, which is not very far from the mark, the butter made will produce about 10%, at the distance of fifty miles from London, if it is sold in a fresh state, and the calf about 15s. at a week old. This does little more than pay rent and expenses; the profit must be made by feeding pigs, or making skim-milk cheese.

An inferior kind of butter is made in some cheese dairies from the oily portion of the milk skimmed from the whey, which is set in pans like milk after the cheese has been made. It is sold at an inferior price to labourers, and seldom comes to market. It is totally unfit for salting and keeping. It is known by the name of *whey butter*.

BUTTER-TRADE. Butter is an article of great commercial importance in many countries, and especially in India, where, under the name of *gher*, it forms one of the staple productions of many districts. In Europe the greatest trade in butter belongs to the more northern nations. The quality of that produced in England and in Holland is considered the best in the world. A considerable quantity of Dutch butter is exported, but all that is produced in England is consumed at home, in addition to large quantities imported from Ireland and the north of Europe. The quantity so imported has been for some time progressively increasing.

	From Ireland	From Foreign Countries

1800 . . .	215,100	—
1805 . . .	225,187	107,169
1810 . . .	303,586	72,121
1815 . . .	330,635	67,450
1820 . . .	365,226	60,627
1825 . . .	423,883	159,332
1830 . . .	—	173,206
1835 . . .	—	131,316

No account of the importations from Ireland can be had later than 1825, the intercourse between the two islands having then been placed upon the footing of a coasting trade; and there is no statement of imports from foreign countries of an earlier date than 1801. In 1831, the latest year for which the accounts of the trade with different countries have been made public, the importations, which amounted to 133,871 cwts., were received from the following countries: *viz.* Russia, 1 cwt.; Denmark, 846 cwts.; Prussia, 5 cwts.; Germany, 17,693 cwts.; Holland, 106,776 cwts.; Belgium, 626 cwts.; France, 2 cwts.; Italy, 4 cwts.; other countries—19 cwts.; total, 133,871 cwts.

It is not possible to state the quantity of butter exported from the United Kingdom to our colonies and foreign countries, in consequence of the practice at the custom-house of including butter and cheese in the same statement. The shipments of butter so made are entirely of the produce of Ireland. The chief customer is Portugal; next to that country Brazil takes the largest quantity; and about 40,000 firkins, or 1000 tons, are annually sent to the English West India colonies.

Various acts of parliament have been passed with the view of preventing fraudulent practices in the packing of butter, but such legislative interference seems unnecessary.

The average contract price for butter purchased for the use of Greenwich Hospital at various times since 1730 has been as under:—1730, 5d. per lb.; 1740, 5d.; 1750, 5½d.; 1755, 5½d.; 1760, 5½d.; 1765, 5½d.; 1770, 6½d.; 1775, 6½d.; 1780, 6½d.; 1785, 6½d.; 1790, 6½d.; 1795, 8½d.; 1800, 11½d.; 1805, 11½d.; 1810, 13½d.; 1815, 14d.; 1820, 9½d.; 1825, 10½d.; 1830, 6½d.; 1834, 7½d.

The rates of duty payable at different times during the present century on the importation of butter from foreign countries have been varied as follows:—1801, 2s. 9d. per cwt., and 3 per cent. ad valorem; 1803, 3s. 6½d. per cwt.; 1804, 3s. 11½d.; 1805, 4s.; 1806, 4s. 3½d.; 1809, 4s. 4d.; 1813, 5s. 1½d.; 1816, 20s.; at which last-mentioned rate it has been continued to the present time (1836).

BUTTERMERE, a chapelry of the parish of Brigham, in Cumberland, much frequented by travellers for the sake of the beautiful lake which bears its name. This lake is about 14 mile long, and ½ mile broad: a swampy flat, partly meadow-land, partly under the plough, intervenes between it and the grand hill at the head of the valley, called Honister Crag. Another level tract, about a mile long, separates it from the fine sheet called Crummock Water; the chapel and village of Buttermere stand at some little elevation on the E. side of the valley, between the two lakes. The number of inhabitants, who are chiefly employed in pasturage and agriculture, is thus given in the population returns:—

1801.	1811.	1821.	1831.
74	109	136	89

exhibiting a remarkable decrease, which is corroborated by a decrease in the number of inhabited houses from 21, in 1821, to 19. The chapelry contains 3480 acres. Slate quarries have been worked in Honister Crag; but not, we believe, for the last few years. The river Cocker rises at the head of the valley, traverses both lakes, and falls into the Derwent at Cockermouth.

There is a tolerably good road from Cockermouth and Lorton, by Crummock Water, to Buttermere, which is continued, as a mountain road, to Seatoller. (BORROWDALE.) There is a road through the Vale of Newlands to Keswick, distant about 9 miles, but it is not suited for heavy carriages, being rough, narrow, and for 2 miles extremely steep. The mountains which enclose this valley belong, on the E. side, to the lowest, those on the W. side and end to the middle, slate-formation, and the smooth conical shapes of the former are remarkably contrasted with the abrupt outlines of the latter. The whole tract, from the foot of Crummock upwards, presents a good specimen both of the sterner and softer features of mountain scenery. About a mile down Crummock, and half a mile from the W. side of the lake, a small stream, falling over a precipice of 156 ft., forms the waterfall of Scale Force. Near its foot, and past Plouthern Tarn, over a low but wide moor, runs the ordinary footway for those who cross from Buttermere to Ennerdale. From the upper end of Buttermere there runs another mountain path of much bolder character, over the pass called Scafell Gap, descending into the head of Ennerdale (here called Gillerthwaite), then mounting the Black Sail and running rapidly down Masedale to Wasdale Head. The writer has crossed these passes with a lady on a clever pony; but the ground is difficult, and a considerable part of it must be done on foot; to those who can walk, a horse will be more plague than profit. From Buttermere down to Wasdale Head may be from 8 to 9 miles: from thence to the next public-house, below the foot of Wasdale, is 4 miles more. It is a route of great variety and grandeur.

BUTTERS, VEGETABLE, the name given to the concrete oil of certain vegetables, from its resemblance to the butter obtained from the milk of animals, and from being employed for similar purposes. The term is also occasionally, but improperly, applied to some vegetable products which are entirely of a waxy nature, such as the wax of the *Myrica cerifera*. The name is likewise bestowed in Siberia on certain algae, species of the genus *Nostoc*, such as *N. pruiniforme*. The most important vegetable butters are produced by the *Russia butyracea* and other species of that genus (*Bassia*) and certain palms, such as the *Cocos butyracea* and the *Elais Guineensis*, the former of which is of great utility to the inhabitants of Brazil, where it grows naturally, and to the negroes of St. Domingo, where it is cultivated; while the latter is very serviceable to the natives of Guinea. (*Library of Entertaining Knowledge; Vegetable Substances; Materials of Manufacture*, p. 221.)

BUTTERS (in pharmacy) was the name formerly given to certain hydrochlorates of the metals, such as antimony, arsenic, bismuth, tin, and zinc. Precipitated sulphur likewise was termed butter of sulphur. These designations are now nearly obsolete.

BUTTMANN, PHILIP KARL, an eminent scholar and mythologist, was born on the 5th December, 1764, at Frankfort on the Main. In the latter part of his life he dropped his second Christian name, but they both appear on the title-pages of his earlier works. He was descended

from the French Protestants who took refuge in Germany from the persecutions of Louis XIV., and his name is a German representative of the French Boudemont. His father, Jacob Buttman, a respectable stationer, placed him, at an early age, under the care of Purman, the learned rector of the gymnasium of his native place, in which he first acquired that taste for philological studies and that love for the Greek language in particular for which he was distinguished through life. In 1782 he went to Göttingen to follow up his classical investigations under the superintendence of Heyne. In 1786, after a short stay at Frankfort, he visited his brother-in-law, Dr. Ehrmann of Strasbourg. There he became acquainted with Schweighäuser, who was then engaged on his edition of 'Polybius,' and Buttman made his first appearance as a philologist in some notes which he furnished to that laborious work. Shortly after he was appointed geographical teacher to the young prince of Anhalt Dessau, in which situation he remained for about eight months. In 1788 he went to Berlin, and had the good fortune to make some literary acquaintances in that city, which led to his being appointed, in a year or two, assistant librarian to the king, and he added to his rather inadequate salary by taking private pupils, and writing for the booksellers. The former employment made him acquainted with the various errors of the Greek grammars then in use, and with their uselessness as text-books for beginners. Accordingly, in 1792, he published a short Greek grammar, which was so superior both in matter and manner to every former book on the subject, that it at once established itself in all the schools of Germany; and even now, after a lapse of more than 40 years, it is the only accidence used in the gymnasia of that country. Buttman was appointed, in 1796, secretary to the royal library, and four years afterwards he was made a professor in the Joachimsthalsche gymnasium, the high school of Berlin; he held this appointment till 1808, when he was appointed one of the original professors in the new university. He was elected a member of the royal academy of sciences in 1806; but so great was his reputation, that his 'Essay on Apollo and Artemis' was inserted in the transactions of that society three years before he entered it. Shortly after his appointment as professor in the university he was selected from his colleagues as classical tutor to the prince royal. After Spalding's death, in June, 1811, Buttman was elected his successor as secretary to the historical philological class of the royal academy of sciences; but he felt this office so irksome, that nothing but his regard for the interests of the academy could have induced him to retain it; for, as Schleiermacher observes ('Gedächtnissrede auf Philipp Buttman,' p. xxi.), 'he never had any inclination for public business, partly because he abhorred complicated responsibilities, partly because he had a well-founded aversion to all mere formalities.' The peculiar constitution of the society, however, induced him to accept this appointment, and his panegyrist adds that he introduced many convenient abridgements of formalities without departing from essentials. In 1821 he was appointed head librarian to the king, and in 1824 was made a knight of the Prussian Red Eagle of the third class. From this year till his death he was afflicted with repeated attacks of apoplexy: he died on the 21st June, 1829. Buttman was married, in 1800, to the eldest daughter of Dr. Selle, the king's physician, by whom he left a family: his son Augustus is a good scholar, and republished, in 1833, his father's well-known edition of 'Demosthenes' Oration against Midias.' Buttman wrote his own life, up to the time of his becoming a member of the Berlin academy, in the third part of Löwe's collection (Bildnisse jetzlebender Berliner Gelehrter mit Selbstbiographien).

The best known of Buttman's writings are:—I. His three celebrated Grammars: (1), the School Grammar, which has been very badly translated in America; (2), the intermediate Greek Grammar, which has been twice translated—once by Boileau, Lond., 1833, and also by the American professor Robinson; (3), his complete Greek Grammar, which only contains the Accidence: unfortunately it is not yet accessible to the English student, though it is far superior to Matthiæ as a collection of facts with regard to the formal part of the Greek language.

II. His 'Lexilogus,' which has been well translated by Mr. Fishlake.

III. His 'Mythologus,' a collection of his mythological and historical essays.

The most remarkable feature in Buttman's literary character was his willingness to give assistance to other writers. He began with assisting Schweighäuser; and Hemdorf, Biester, Wolf, Spalding, and Niebuhr, successively received and acknowledged his valuable aid. In all his literary labours Buttman was distinguished for an honest and discriminating scepticism. He never doubted, however, but with a wish to find out the truth, and in contriving methods of fathoming a difficulty he never was exceeded in ingenuity. His private character was very amiable, and doubtless Schleiermacher was justified in saying that 'there was hardly one in the circle of his literary acquaintances so well known, so unanimously appreciated, and so entirely beloved as he was.'

BUTNERIA CÆÆ, a group of plants, by some botanists considered a distinct natural order; by others reduced to a section of Sterculiaceæ. They belong to the malval alliance of Exogens, and are readily known by their petals being bagged at the base, their stamens partly sterile and petaloid, and their fruit covered with hooked spinous hairs. From Sterculiaceæ Proper, they differ by the presence of petals, and their stamens not being united into a column; from Malvaceæ, by their two-celled anthers and bagged petals; and from Lasiopetalæ, by their calyx not being coloured like a corolla, and their petals not rudimentary. The species are chiefly inhabitants of tropical countries; they partake of the mucilaginous inert properties of Malvaceæ: their bark often yields a tough fibre fit for manufacture into cordage; and one species, Theobroma Cacao, produces the seeds from which the buttery and somewhat bitter substance called cocoa is obtained, and which, mixed with vanilla, forms the basis of chocolate.

[Butneria inodora.]

1, a complete flower seen from above; the outer pentagon is calyx; the anthered bodies are petals, and the 5-rayed centre represents the 5 sterile stamens; 2, is the calyx cut open, with the stamens attached to it; 3, is a longitudinal section of a flower, showing the origin of the petals; 4, a petal; 5, a calyx seen from above, with the young fruit cut transversely, and the hooked hairs with which it is covered projecting from its sides; 6, a stamen; 7, the ovary.

BUTTON. This useful little appendage to almost every dress is made of nearly every variety of material. Gold, silver, brass, copper, pewter, mother-of-pearl, hard wood, bone, ivory, horn, leather, paper, glass, silk, wool, cotton, linen, thread,

are all formed into buttons, and the manufacture is carried on to a very great extent.

The varieties of the form of buttons may be reduced to four, viz. 1. those *with shanks*; 2. those *without shanks*; 3. those *on wire moulds* (or rings); and 4. buttons *covered with silk, cloth, or other material*.

1. **Metal buttons with shanks** are generally punched out of a plate of brass having rather less zinc in its composition than ordinary brass. The disks so punched out, after having their edges trimmed to take off the burr, are ready for the shank. The shanks are made of wire by a most ingenious machine invented by Thomason of Birmingham. A coil of wire is placed in the machine, one end of which gradually advances to a point where a pair of shears cuts off a piece of the requisite length; a stud then presses against the middle of the piece and forces it between the two jaws of a vice into a staple-like form: the jaws then compress it so as to form the eye of the shank: a little hammer then strikes the end and makes it level, and another movement finally drops it complete into a box.

The shanks being placed upon the disk in their proper position, and kept there by a bent flat slip of iron, a small piece of solder is placed at the foot of the shank. In this state 100 or more are put upon an iron plate and heated in an oven till the solder runs and fixes the shank. They are then turned separately in a lathe, the chuck of the lathe being so formed as to allow the buttons to be put in and taken out with great facility. The gilding is performed with an amalgam of gold and mercury about the consistence of butter: five grains of gold are sufficient for a gross of buttons.

White metal buttons, such as those on soldiers' dresses, are cast in moulds, containing ten or twelve dozen, and the shanks are placed in the moulds previous to casting, so that when the buttons are cast the shanks are fixed at the same time.

Mother-o'-pearl buttons are cut out of the pearl shell by means of a small cylindrical saw, i. e. a tube of steel with its edge cut into teeth. This tubular saw has a pulley on the tube, and it is made to revolve rapidly after the manner of a lathe. The shell is then pressed up against it, and thus the circular disk for the button is quickly cut out of the shell; if the shell is thick the circular disk may be split into two: the disks are then turned in a lathe. As the shanks cannot be soldered in, and they would not look neat if rivetted through the button, a hole is turned about half way through, the hole being wider at the bottom than at the top, or, as it is called, dove-tailed. The stem of the metal shank is just the size of the smallest part of the hole, and the stem is made a little hollow by drilling a conical hole up it, so as to leave the metal very thin at the edges. The shank being now put into the dove-tailed hole, a slight blow with the hammer spreads the thin edge of the stem under the dove-tailed edge of the hole, and the shank is firmly fixed. Mother-o'-pearl buttons are sometimes ornamented with eccentric circles, flutes radiating from the centre, &c., all of which are executed in the lathe by means of an eccentric chuck and slide rest.

2. **Buttons without shanks** are made of mother-o'-pearl, wood, bone, metal, &c., the metal ones being stamped and the rest turned. They have four holes through which the thread is passed to fix them on the garment. These holes are stamped in metal buttons, but they are drilled in those which are made of other materials. The holes are drilled while the buttons are in the lathe: four long drills are made to converge towards the button, and thus the four holes are all drilled at once.

3. Buttons on wire moulds are merely wire rings covered with thread.

4. **Covered buttons.** Although many beautiful specimens of metal buttons have been produced by the manufacturer, still *metal* buttons may be said to be in great measure superseded by covered buttons. The stimulus being thus given, a great deal of ingenuity has been shown in the manufacture of covered buttons, and a number of patents have been obtained for the inventions: the following two plans will give a general idea of the principles of their construction. In one plan a metal disk is punched out of thin iron plate, which by subsequent punches has its edges turned up and then bent a little inwards: this is done to form the body of the button. Another smaller disk, capable of lying within the edges of the above, has a round or oval hole in the centre: this is to form the back. A circular

piece of the stuff called *florentine* is then wrapped round the larger disk, and the edges brought over and pressed into the hollow; the smaller disk or back is then pressed into its place, and then the turned-up edges of the face being compressed on the back, the whole becomes firmly fixed together, and the cloth protruding through the hole in the back affords the means of fixing it to the garment. In the other plan, which produces a very neat button, the disk for the body is left flat, and the back is a small circular disk with a round hole in the centre, but the outer edge is cut into eight sharp triangular points like a little star. These points are bent to a little less than a right angle to the disk, so that the points incline a little inwards. Besides these two metal disks, three pieces of paper and two pieces of cloth are necessary, so that the button consists of no less than seven separate pieces, which are put together in the following order:—1st. On the piece of florentine which forms the outer covering is laid a piece of paper of the same size; on this the iron disk forming the body; on this another piece of paper the same size as the body; on this another piece of paper crumpled up into a little pellet to help to form the shank; on this a piece of coarse cloth; and finally the metal back. In putting on the back the florentine is gathered up over the whole of the materials, and then the points of the back are pressed into it: and as the points of the back are bent a little inwards (as was mentioned above), the consequence of the pressure is, that as they enter the cloth they bend more and more inwards, and thus form eight little *hooks* which very neatly and effectively hold the whole together. The little paper pellet makes the cloth protrude through the hole in the back, and forms the cloth shank by which it is attached to the coat. Almost the whole of these processes are performed by punches of various forms, but it has even been proposed to do the whole by a machine, and a patent has been taken for one in which by placing two plates of iron, a roll of florentine, a roll of cloth, and three rolls of paper, and by setting the machine in motion, the whole of the seven parts of this ingenious button are to be cut out, put in their respective positions, and combined together into a perfect button.

A very beautiful and perfectly novel steel button has been lately produced by Mr. Barton of the Royal Mint. It is intended for court dresses, being far too delicate and too expensive for ordinary purposes. By means of most accurate dividing machinery, a number of groups of fine lines are engraved on the button, the graving point being the splinter of a diamond;—the machine is so accurate, that 10,000 lines can be drawn within the inch. The groups of lines may be disposed in triangles or hexagons, after the manner of a honeycomb, or in any other form at the option of the artist, or the lines may be made to cross each other in any direction. The pattern is comparatively of little importance, the beautiful effect being produced by the brilliant reflection of the light, which exhibits all the colours of the rainbow in playful clouds like mother-o'-pearl, or in intense colour like the ruby or the emerald.

BUTTON, THOMAS, one of the early arctic navigators, was an able seaman in the reign of James I., whose son (the Prince Henry) seems to have been his first patron. In 1612, about three years after the unhappy death of the navigator Hudson, the merchants of London engaged Button to follow up Hudson's discoveries with two ships, the *Resolution* and the *Discovery*. He was accompanied on this expedition by Bylot and Prieket, who had sailed with Hudson, their experience and high qualities as seamen being considered sufficient in those days to outweigh the suspicions of their having partaken in the mutiny that deprived Hudson of life. Crossing the Atlantic, Button entered Hudson's Straits to the south of *Resolution* Islands, and then keeping without deviation a western course, he reached Southampton Island. Sailing still to the west, he fell in with the American continent, in lat. 60° 40'. From this point of the main land, which he named 'Hopo Checked,' he made away to the south, and on the 15th of August, 1612, he discovered the mouth of Nelson's River, in lat. 57° 10'. At this point, which subsequently became the chief establishment of the Hudson's Bay Company, Button determined to winter. To secure his ships against the icebergs, he caused strong piles to be driven into the sea. To keep his men warm, he had three large fires constantly burning in each of his vessels. Notwithstanding all his precautions, several of the sailors died, and he himself had a severe illness. Button, like Captains Franklin,

Parry, and Back, who have recently visited those inhospitable regions, showed great ability in amusing his men, in order to keep up their spirits against the depressing effects of inactivity: he proposed to them questions connected with navigation and mathematics, and thus mingled instruction with amusement. On the return of spring, he employed his ships' companies in killing game, which was so abundant; that 1800 dozen of white partridges were brought in during their stay there.

The river thawed on the 16th of February, and in two months, the sea being clear of ice, he explored the bay in the neighbourhood of Nelson's River, and named it Button's Bay. He then went north as far as lat. 65°, and fell in with a cluster of islands, which he called Mancel's Islands (now Mansfield's). Proceeding to Cape Chidley, he discovered the passage between that cape and Labrador, and thence reached England in sixteen days, in the autumn of 1613. He was the first navigator that reached the eastern coast of America through Hudson's Straits. It is to be regretted that he never published an account of his voyage; all that we have of his journal is an extract in Purchas. The government of the day made him a knight, but neither they nor the merchants of London ever employed him again to prosecute those discoveries for which he had shown so much aptitude, skill, and judgment. (Purchas, *his Pilgrims*; Cooley, *Hist. Maritime Discoveries*.)

BUTTRESS, a projecting support to a wall, most commonly applied to churches in the Gothic style, but also to other buildings, and sometimes to mere walls. Buttresses are usually finished with a sloping top, and divided into several heights, each of which projects less from the wall as they ascend: each projection is usually covered with a sloping side or sides, similar to a roof. The buttresses of Gothic buildings are variously decorated. Norman buttresses, which came into use probably from the time of the decay of Roman architecture, are plain broad faces slightly projecting from the wall of the building to which they belong. In appearance they are very similar to the shaft of a pilaster,

castle, Norfolk. But these decorations are most probably of a later date. An additional resemblance to the Roman pilaster appears in these buttresses, when they are found with a narrower face projected on the broader buttress. Castle Rising and Norwich castles contain good examples of Norman buttresses. Of early English buttresses, which immediately succeeded the former, Mr. Rickman distinguishes four kinds. The *first* is a flat buttress, narrower than the Norman, with mouldings more delicate, but very similar to, and hardly to be distinguished from the Norman. The *second* is a buttress projecting at times nearly as much as its breadth; at others, more than the breadth of the buttress. These buttresses sometimes are without set-offs, or have only one forming a division in the whole height. There are buttresses at Salisbury which belong to this class, and are highly enriched with niches and decorated with ornaments, but they have a very weak appearance. The *third* kind consists of long slender narrow buttresses, with a considerable projection divided into several heights. Mr. Rickman remarks that they are not common: they occur in

A, Norman Buttress. B, Early English Buttress. C, Decorated English Buttress.

from which they most probably derive their origin. The top of these buttresses is terminated by an inclined plane moulded underneath on the front face only. The bands which often occur in Norman buildings as a sort of capping to the basement of the wall [BASEMENT] are often continued round the sides of the buttress, thus making the lower part of the buttress as it were a pedestal to the upper part, or more properly to the pilaster. In decorated buildings, Norman buttresses are sometimes ornamented at the angles with columns, as at Castle Rising

[Perpendicular English Buttress
Woolpit, Suffolk.

[Decorated English Buttress
Waltham Cross.]

some towers. The fourth kind of buttress of this period, and perhaps the latest, is divided into stages or divisions receding one behind the other; but this also is not common. Like all the former, it is finished with a triangular top, similar to the roof and gable ends of a building. These two last kinds are very similar in character.

Mr. Rickman is of opinion that about the close of this period, flying buttresses were first constructed, being thrown from the side aisle buttresses to the buttress of the nave and choir. He cites Salisbury and Chichester cathedrals as examples. Early English buttresses have generally pyramidal tops; the sides of these buttresses are sometimes played at the edges, with pedestal-like bases. The shaft also is at times divided into one or more divisions, as at Lincoln.

Beverly minster has columns at the angles of the buttresses, with a niche in the pyramidal head. The decorated English buttresses which succeeded these present many varieties: they exhibit some of the leading features of their predecessors, but are generally highly enriched. These buttresses, when used at the angles of buildings, are often applied diagonally to the angle. Mr. Rickman observes that the decorated buttress is finished in a variety of ways: 'some slope under the cornice, some just through it, and some run up through the battlement and are finished with pinnacles of various kinds.' He mentions three examples of rich buttresses of the decorated style: one in the west front of York minster, another at the east end of Howden church, Yorkshire; a third at the east end of Walsingham priory. This last is almost in the perpendicular style, which immediately followed the decorated. The decorated buttresses are enriched with pannels, niches, and a variety of ornaments. Perpendicular English buttresses, used externally, vary but little from those which preceded them, except as to the freedom of design, in which they are inferior. The triangular or roofed heads are seldom used. Mr. Rickman observes that there are few large buildings of this last period without flying buttresses; and also that the small buttresses of this style attached to screen-work, stall-work, and niches are different from any before used, and mark the period distinctly. Octagonal turrets are sometimes used as buttresses, as in Henry VII's chapel at Westminster, from which spring the flying buttresses.

[Flying Buttress, from Henry VII's Chapel, Westminster.]

The most superb of this kind ever executed in this country belong to this edifice. For a variety of details relative to buttresses, we refer the reader to Rickman's 'Attempt to discriminate the Styles of Architecture in England from the Conquest to the Reformation.' Britton's 'Ecclesiastical Architecture' contains several good examples of buttresses.

BUTYRIC ACID occurs not only in butter, but in the gastric juice and urine. In order to obtain it, butyrate of barytes (which is formed by a tedious process) is to be mixed with one-and-a-third time its weight of phosphoric acid of specific gravity 1.12; the butyric acid set free, redissolves in the liquor, which is to be repeatedly shaken

with æther to combine with the butyric acid; the æther being distilled with a gentle heat, butyric acid remains.

The properties of this acid are, that it is a colourless liquid, its smell is acid, penetrating, and analogous to that of rancid butter. Its taste is acid and biting, with a sweetish after-taste, like that of nitric æther. Its specific gravity at 75° Fahrenheit is 0.9765. It remains fluid at 16° Fahrenheit. Its boiling point is lower than that of water. It combines with water, and with anhydrous alcohol, æther, and fixed oils, in all proportions. When exposed to the air it evaporates gradually without leaving any residue. When distilled it absorbs the oxygen of the air in the retort, and decomposes, leaving cony matter.

It is composed nearly of

Carbon	62.3 or 8 equivalents.
Oxygen	30.6 or 3
Hydrogen	7.1 or 6

100.0

Butyric acid combines with different bases to form various butyrates; they are all artificial compounds, and no one is applied to any use: instead therefore of giving an account of the individual salts, their general properties only will be mentioned. When dry they are usually inodorous, but if moist they emit a smell of butter. When the dry salts are subjected to a strong heat they are decomposed, and yield carburetted hydrogen gas, carbonic acid gas, and an empyreumatic oil, of an orange-yellow colour and an aromatic odour, while the base of the salt is left mixed with charcoal. These salts are easily recognized by the characteristic odour of butyric acid, which is emitted when a very small quantity of the salt is moistened with concentrated sulphuric acid.

BUTYRINE, a peculiar oleaginous matter, discovered by Chevreul, in butter, in which it exists combined with oleine and stearine, and a very small quantity of butyric acid. In order to prepare it, butter must be first separated from butter-milk by melting and pouring it off, and the butter thus purified is to be allowed to cool very slowly in a deep porcelain vessel, and then it is to be exposed for some days to a temperature of 66° Fahrenheit; by this treatment a large quantity of stearine is separated, crystallized in small grains, and an oily compound is obtained, which is to be carefully filtered, and then put into a glass vessel with an equal weight of alcohol of specific gravity 0.796, and kept at the temperature of 66°. The mixture is to be frequently shaken during 24 hours, and then the alcohol is to be poured off, and the insoluble portion set aside. By carefully distilling the alcohol, an oil rich in butyrine is left, but as it is slightly acid it is to be treated with carbonate of magnesia: the butyrate of magnesia thus formed being very soluble in water, is readily separated; the remaining fatty matter is then to be treated with alcohol, and this being distilled the butyrine is left pure.

The properties of butyrine are, that at 66° it is very fluid, and it congeals at about 32°. Its smell resembles that of heated butter. It is generally yellowish, but this colour is not essential, for some kinds of butter yield it almost colourless. Its specific gravity is 0.908; it is insoluble in water; but alcohol of specific gravity 0.822, when boiling, dissolves it in all proportions. When two parts of butyrine are combined with ten parts of boiling alcohol, the mixture on cooling becomes turbid; but when twelve parts of butyrine are similarly treated with the same quantity of alcohol, the mixture remains transparent even after it has become cold. During distillation the alcoholic solution becomes very slightly acid: and the residue contains traces of butyric acid. Butyrine readily saponifies, and is then converted into glycerine, and butyric, capric, caproic, margaric, and oleic acids.

BUXAR, a fortified town in the district of Shahabad, province of Bahar, situated on the right bank of the Ganges, in 25° 33' N. lat. and 83° 57' E. long., about 60 miles below the city of Benares. The fort is built on an eminence which projects into the river, the works are kept in good repair, and there is constantly an English garrison in it. The place is principally celebrated as the scene of one of those victories by which the British power in India was secured. The Mogul chiefs Suja ud Dowlah and Cossim Khan were encamped here with an army computed at 40,000 men, when, on the 23rd October, 1764, they were attacked and completely routed by 856 European and 6215 native troops under Major (afterwards Sir Hector) Munro.

Upwards of 2000 of the Mogul troops fell in the battle, and many more were drowned in their flight across a bridge of boats thrown over the Ganges. The force of Suja ud Dowlah, who was then the only Mogul chief possessing any considerable power, being thus destroyed, the emperor was thrown into the power of the English, and on the day following the battle applied to Major Munro for protection. (Mill's *Hist. of British India*.)

BU'XINA, a vegetable alkali obtained from the box-tree (*Buxus sempervirens*). It is difficult to procure this substance colourless; and it has generally the appearance of a translucent deep brown-coloured mass. Its taste is bitter, it excites sneezing, and is insoluble in water, but is dissolved in small quantity by alcohol and ether. It acts as other alkalies on reddened litmus paper, and forms neutral salts with the acids, which are more bitter than the base itself; and the solutions give gelatinous white precipitates with potash. Sulphate of buxina crystallizes confusedly. This alkali is contained in every part of the box-tree, and the bark gives nearly one per cent. of it.

BUXTON, a market town and chapelry, in the parish of Bakewell, and in the county of Derby, with 1211 inhabitants, is situated in that part of Derbyshire called the High Peak, in the hundred of High Peak, on the high road from Derby to Manchester, 33 miles N.W. from Derby, 20 miles S. from Manchester, 22 miles N.W. from Matlock, and 159 miles N.W. by N. from London. Its baths have been celebrated from the time of the Romans.

The town is situated in a deep valley or basin, surrounded by bleak hills and extensive tracts of moorland. It would be entirely environed with mountains but for the narrow ravine down which the river Wye flows on its way to the Derwent, parallel with the high road which leads to Bakewell. *Aire Edge*, on the Leek road, 3 miles from Buxton, is, next to *Kinder-scout*, the highest mountain in the N.W. of Derbyshire, being 1000 feet above the valley in which Buxton Crescent stands, and 2100 feet higher than the town of Derby. From this mountain four rivers issue in opposite directions—the Wye, the Dove, the Goyte, and the Dean. *Chee Tor*, a perpendicular and stupendous rock of limestone, 360 feet high, is situated near the village of Wormhill, and about 5 miles from Buxton. A few miles farther is *Mam Tor*, 1300 feet above the valley in which it stands; and a little E., the still higher peaks of *Win hill* and *Loschill*, which may be distinguished by their form from all the mountains in the county. The sterility which once formed the chief feature in the scenery round Buxton is fast disappearing. Extensive woods and plantations now clothe the sides and summits of many of the neighbouring hills.

Buxton consists of two parts, the old and the new town. The former stands upon much higher ground than the latter, and has still the remains of a cross in the centre of the market-place. The main street is wide, and contains a few good inns and lodging-houses, but the buildings in general are old and low. This was formerly the only entrance from the W. into Buxton, until a new road was made a few years ago, which avoids the old town and joins the London road at the church. The new part of the town may be said to begin at the Crescent and to stretch along the Bakewell road, the buildings of which form a handsome entrance to the town on that side, and afford many pleasant residences to those who seek more privacy than can be had at the public hotels.

The Crescent at Buxton is in the form of a segment of a circle. The basement story is a rustic arcade, forming a piazza 7 feet wide within. Over the arches a balustrade runs along the whole building. Above the piers are Doric pilasters that support an ornamental architrave and cornice, which is terminated by another balustrade, in the centre of which, cut out of stone, are placed the arms of the Cavendish family. This extensive and elegant structure is three stories high, and contains 378 windows. It comprises two hotels, a library, an assembly-room 75 feet long, and a news-room, besides the baths and a few private residences. The stables, as complete and extensive as the Crescent itself, occupy a large site of ground on the hill behind the chief structure, but divided from it by the main road. They are built in a circular form, and have a covered ride 160 yards round. This immense pile of building was erected by the late duke of Devonshire, in 1781, at a cost of 120,000*l*. The stone employed in the foundations and inner walls was found near the spot; and the fine freestone, used in the

front and sides of the building, was dug out of a quarry not a mile distant.

At the W. end of the Crescent, and nearly adjoining it is the old hall, the most ancient building in the lower part of Buxton, having been erected in the reign of Elizabeth, by the earl of Shrewsbury, in whose custody Mary, queen of Scots, was placed. In one of her visits to Buxton, the queen occupied apartments in this building which are still shown as hers, on one of the windows of which are scratched the lines said to have been written by her on her departure.

Buxtona, quæ calidâ celebrabere nomine lymphæ,
Forte tibi posthac non advena, vale.

'Buxton, farewell! no more ap's say feet
Thy famous tepid streams & ever greet.'

This house was considerably enlarged in 1670, and though inferior to the more fashionable hotels in the Crescent, is preferred by many families on account of its having baths for both ladies and gentlemen fitted up within its walls. There are also warm and shower baths, besides a bath for the gratuitous use of the poor.

The public baths at Buxton are very numerous, and are fitted up with every attention to the convenience of the visitors. The common tepid baths all lie together at the W. end of the Crescent, forming a part of the lower story. Besides a public bath, around two sides of which are numerous dressing-rooms, there are two private baths for gentlemen, and the same number for ladies. At the opposite end of the Crescent, adjoining the piazzas, are two hot baths, and vapour and shower baths, all heated by steam, which are supplied from what is called Bingham's well. Most of these are lined with white marble, and the temperature of the hot baths is most accurately adjusted by an ingenious contrivance for the introduction of cold and hot water.

At the extreme end of the town, on the Macclesfield road, is a cold bath, said to be of the same temperature as the waters at Matlock (66° Fahrenheit).

The well at which the water is supplied to those who resort to it is in a small building, in the style of a Grecian temple, in front of the W. wing of the Crescent. In the centre of this tasteful building, called St. Ann's Well, is a white marble basin, into which the water issues from the spring. By the side of this basin is a double pump, from which either hot or cold water may be procured within a few inches of each other. The spring flows at the rate of 60 gallons a minute, the water being somewhat colder than the waters at Bath, but warmer than those of Matlock and Bristol.

Besides what is properly called the Buxton water, there is a chalybeate spring of a rough strong taste, issuing from a chalky stratum on the N. side of the river Wye, at the side of the turnpike-road behind the Crescent, over which a neat stone structure has been erected by the duke of Devonshire, to preserve it for the use of visitors. Mixed with the other, this water proves purgative.

The public walks at Buxton, of which there is great variety, are laid out with much taste, and ornamented with shrubs and plantations.

The environs of Buxton abound with natural curiosities and romantic scenery. The high perpendicular crags on the Bakewell road, bordering the valley of the Wye, make it the most interesting, as it is the most accessible of all the scenery in the immediate vicinity of Buxton. At the distance of about half a mile, in a different direction, are the limestone quarries and Pool's hole. The latter is a cavern of considerable dimensions in a limestone rock, contracted in its entrance, but spacious in the interior. Its roof and sides are covered with stalactites, one of which, more remarkable than the rest, about the middle of the cave, is called 'the flitch of bacon.' Here the cave again contracts, but beyond it becomes wide and lofty as far as a large massy column of stalagmite denominated 'the Queen of Scots' pillar,' from a tradition that she stopped at this point. The further end of the cavern, comprising about 100 yards, is not very accessible. The whole length is 560 yards. The sides of the mountain are partly occupied with dwellings, not built, but excavated out of the ashes which have been thrown here from the lime-kilns. A considerable quantity of lime is burnt here, and sent into distant parts by the Peak Forest railway, which is near. At a little distance from the mountain beneath which is Pool's hole, is a place called 'Diamond Hill,' from its furnishing specimens of quartz of an hexagonal shape, which are known by the name

of Buxton diamonds, the whitest of which have the property of cutting glass. About 5 miles from Buxton, at Barmour Clough, by the side of the road leading to Castleton, is an intermittent spring, called 'the ebbing and flowing well.' The water issues in different quantities, and at irregular intervals, out of several openings by the side of a small pool or basin. In dry seasons several weeks elapse without any flow into the well; whilst at other times the water flows once in twelve hours, sometimes every hour, and occasionally three times in an hour. A gurgling noise is heard when it flows, which continues for 4½ minutes. In the space of one minute 23 hogheads have been discharged. This curious phenomenon is supposed to be occasioned by there being a reservoir of water in the hill above, from the lower part of which a duct rises to some height, but not so high as the reservoir, and afterwards descending to the well at the foot of the hill, acts on the principle of the siphon.

The rocks about Buxton consist of beds of limestone and of lava or toadstone, which lie alternately one upon the other. In many parts of the county there are three beds of each, which are many yards thick. There are many shops in the place for the sale of the mineral productions of the Peak, manufactured into various articles of ornament and use, besides fossils and specimens of natural curiosities. Among these is a beautiful spar, denominated 'Blue John,' formerly used in repairing the roads, but now worked into the most elegant vases, and purchased at the expense of forty guineas a ton. This spar is found near the Shivering Mountain, in the neighbourhood of Castleton.

The church in Buxton is an elegant modern edifice, built in 1812 by the duke of Devonshire, its patron, adjoining to which is a large burial-ground. The living is a perpetual curacy in the diocese of Lichfield. The building formerly used as a church is now converted into a school upon Dr. Bell's plan, having endowments which amount to 94*l.* per annum. There are places of worship in Buxton for Presbyterians, Independents, and Wesleyan Methodists.

The market is held on Saturday; and the fairs on Feb. 3rd, April 1st, and May 2nd, besides a cattle-fair on the 8th of Sept. The town is in the honour of Tutbury, duchy of Lancaster, and within the jurisdiction of a court held at Tutbury every third Tuesday, for the recovery of debts under 40 shillings.

The number of visitors at Buxton varies from 12,000 to 14,000 annually. There are accommodations for 1500 at one time. The season commences in June, and ends in October.

BUXTON WATERS. The waters of Buxton belong to the northern or Derbyshire thermal springs, which have a lower temperature than those of the southern or Gloucestershire and Somersetshire group, except Bristol. They are of the calcareous class of mineral waters, and rise in a valley situated on the west edge of the great limestone range, which extends through the county of Derby from Castleton southwards, comprising what is termed the Peak Forest. The surface of this district is occupied, according to Farey, by the outcrop of four strata of limestone and three beds of amygdaloid or toadstone, interposed between the limestone strata; but it should be observed that this division of the limestone by regular beds of toadstone, has been stoutly denied and at present is not generally received. Above the upper stratum of limestone is a coarse sandstone or millstone grit, considered by many as the inferior bed of the coal formation, which occupies the whole country E. and N. of this district. Buxton is immediately to the S. of the outgong of the lowest stratum of limestone. The limestone, which is of a whitish or yellowish colour, is full of encrinuræ, madrepores, and other organic remains. The direction of the strata is generally N. and S. A remarkable fault is observed in the valley of the Derwent at Matlock: the upper bed of limestone on the western side of the valley is brought down below the second bed on the E., and the upper bed of toadstone on the one side is nearly on the same level with the second bed on the other. The fault is said to extend N. as far as Buxton, where it takes a N.W. direction to North Bradwell, and terminates at Litton near Tideswell; but both the direction and extent of this fault have been much disputed. It is in the course of this fault that the thermal springs of Buxton and Matlock are found. That of Buxton possesses the higher temperature, viz. 82° Fahr., which never varies at any hour of the day or season of the year. This water has been long celebrated for its medicinal

virtues. It is more remarkable for the nature of its gaseous impregnations than for the quantity or nature of its saline ingredients. By a recent analysis it appears to contain only 15 grains of solid contents in each wine-gallon. According to Mr. Gairdner its composition is—

Of gaseous contents—		Cubic inches, per Gallon.
Carbonic acid	.	1.50
Nitrogen	.	4.64
Of solid contents—		6.14
Hydrochlorate of magnesia	.	Grains, per Gallon. .58
" soda	.	2.40
Sulphate of lime	.	.60
Carbonate of lime	.	10.40
Extractive matter and vegetable fibres	.	.50
(Loss)	.	.52
		15.00

Owing to the quantity of calcareous matter, the water is hard. It sparkles a little when first received at the fountain. It is exceedingly clear, and does not become turbid by long exposure to the air. Over the bath a stratum of vapour hovers, which is more or less dense according to the state of the weather and the degree of attention paid to the ventilation of the apartment. The chalybeate spring contains about half a grain of carbonate of iron in each gallon, and is a soft water.

The waters issuing from the warm spring are employed both internally and externally. A course of the water internally is generally taken at the same time as the baths are used; but in some habits of body the one mode only is admissible. Persons of the sanguineous temperament, especially if plethoric, can rarely take the waters internally, without at least previously undergoing some preparatory treatment,—either venesection, cupping, or the use of purgative medicines. During all acute inflammatory diseases they must be avoided; and though very beneficial to persons subject to gout and rheumatism, the waters must not be employed either when an attack of the disease is approaching, or while much pain of the joints remains when the disease is receding. Persons in whom the digestive organs are feeble, either naturally or from the effects of what is termed *good living*, derive, in general, much benefit from the internal use of these waters. In most cases they should be taken early in the morning, after the bath, if these two modes be employed simultaneously. The quantity to be used should not at first exceed half a pint, taken in two equal portions, a quarter of an hour (during which the invalid will walk along the terrace when practicable) being allowed to intervene between the two glasses. About noon the same quantity should be again taken, observing similar rules. Some patients are however obliged to restrict themselves to its use during the forenoon, omitting the morning dose. No one should exceed a pint and a half in the course of each day.

The chalybeate water is sometimes used at the same time, and it is said that a mixture of the two forms a purgative draught. Upon the propriety of using the chalybeate at any period during his stay, the invalid must consult his medical adviser on the spot. It ought never to be used as a common drink, more particularly by persons of a plethoric habit of body.

The warm baths may be employed even by the most delicate persons, provided bathing in any form be proper. At first the stay in the bath should not exceed one minute, as the plunge is the most beneficial part of the process. The time may be gradually extended, but should never exceed fifteen minutes. Where a general bath cannot be borne by gouty or rheumatic patients, pumping the water upon the affected joints is frequently highly efficacious in reducing the swelling and restoring flexibility. During the use of the baths no mercurial medicines of any kind should be taken, unless under the direction of a competent medical adviser on the spot. (Farey's *Derbyshire*; Gairdner on *Mineral Springs*; Denman, Saunders, Scudamore.)

BUXTON, JEDEDIAH, was born at Eltnton, near Chesterfield, about the year 1705. His grandfather had been clergyman of the parish, and his father was school-master of the same place; but Jedediah was so illiterate that he could not even write, and his mental faculties, with one exception, were of a low order. He possessed, however

remarkable facility in performing arithmetical calculations; and when he fairly understood a problem, which it was not easy for him to do if it was a little complicated, he solved it with wonderful rapidity. He was altogether incapable of looking into the relations of things, except with respect to the number of parts of which they were composed. After hearing a sermon he knew nothing more of it than that it contained a certain number of words, which he had counted during its delivery. If a period of time were mentioned he began calculating the number of minutes which it included; and if the size of any object were described, he would at once compute how many hair's-breadths it contained. His ideas were comparatively childish; and his mind was only stored with a few constants which facilitated his calculations; such as the number of minutes in a year, and of hair's-breadths in a mile. His system of mental arithmetic was not founded upon any sound principles; in fact he could scarcely be said to have a system. He would, for instance, in order to ascertain the product of 478 multiplied by 100, proceed first to multiply it by 5 and then by 20, instead of at once adding a couple of ciphers.

His condition in life appears to have been either that of a small land-owner or a day-labourer; but probably the former. Having a strong desire to see the king, he walked up to London to gratify this wish; but from some circumstance or other he did not see him. During his stay in the metropolis Jedediah was seen by several members of the Royal Society, who examined him. He was taken to see Garrick in Richard III., and during the performance occupied himself in counting the number of words which each of the actors made use of; the quantity of steps in a dance; but he acknowledged that the instrumental music, with its complication and variety of sounds, baffled his skill. In June, 1754, a portrait of Buxton appeared in the 'Gentleman's Magazine,' with a short account of his life, which is probably the most authentic of any of the notices which have been published concerning him. He is represented in the print as being in his 49th year. Glover, in his 'History of Derbyshire,' states that he was born in 1707, but is unable to give the exact time of his death, which however occurred between 1770 and 1780. He was married, and had a family.

BUXTORF, a family celebrated for its attainments in Hebrew literature. **JOHN BUXTORF** was born on Christmas-day, 1564, at Camen in Westphalia, of which place his father was Calvinist minister. He was educated at Marlburg and Herborn, under Piscator, and afterwards received instructions at Bâle and Geneva from Grynæus and Theodore Beza. He occupied the Hebrew chair at Bâle for 38 years of his life, and so attached was he to that University, that he declined many advantageous offers of a similar occupation both at Saumur and at Leyden. Besides maintaining a large correspondence with all who were skilled in the leading object of his research, he lodged and supported in his house many learned Jews, with whom he familiarly conversed, during his leisure hours, respecting their language. He died, September 13th, 1629, after having published, besides many separate tracts, more than one 'Grammar' and 'Lexicon' of the Hebrew and Chaldean tongues, a 'Concordance,' and a 'Hebrew Bible' with the notes of the Rabbins.

JOHN, son of the preceding, was born at Bâle, August 13th, 1599, and exhibited precocity so remarkable, that in his fourth year it is said that he understood German, Latin, and Hebrew; a statement doubtless greatly exaggerated. After cultivating Hebrew, in France, Germany, and Italy, he succeeded his father at Bâle, 1630, where he died, August 16th, 1664. Besides collecting, augmenting, and editing many of his father's works, he was the author of several original treatises on Hebrew literature.

JOHN JAMES, son of the preceding, like his father and grandfather, was professor of Hebrew at Bâle, where he was born September 4th, 1645, and died April 1st, 1704. He travelled in Holland, France, and England, and was received every where with honour, especially at Cambridge. He printed nothing in his lifetime but a preface to his grandfather's work entitled 'Tiberias,' which is an historical and critical vindication of the Masoretic points, the origin of which he assigns to Esdras. But he left behind him many MSS. connected with Rabbinical literature. Another **JOHN**, nephew to the above, was also professor of the Oriental languages at Bâle, and died in 1732, leaving a son to distinguish himself by similar learning.

The works of the Buxtors greatly advanced the progress

of Hebrew literature, and the depth of their learning has never been disputed. By the Romanists in general they have been esteemed too much addicted to Rabbinical fancies, and in the controversy respecting the Hebrew points, their espousal of them has been a frequent object of attack.

Of the elder Buxtorf, however, scholars, such as Vossius and Casaubon, spoke with the highest encomium, and Joseph Scaliger expressed himself thus—that he ought to be considered the master of the Rabbins, that he was the only man who understood the Hebrew language thoroughly, and that, notwithstanding his own grey beard, he would gladly become his scholar.

BUXUS, the genus of plants whose species afford the valuable hard wood called Box. It is remarkable botanically as being the most northern arborescent plant of the natural order Euphorbiaceæ, all the other trees of which are confined to mild or tropical climates. Its essential character is to have both the male and female flowers upon the same individual; a three or four-parted calyx; in the males a two-lobed scale and four stamens placed round the rudiment of an ovary; in the females three small scales, three styles, three blunt stigmas, and a three-horned, three-celled, six-seeded capsular fruit.

The only two certain species are *B. sempervirens* and *B. Balearica*. The former or common box forms a large evergreen bush or small tree, common all over the south of Europe, from Spain to Constantinople, and reaching even so far as the north of Persia. In this country it is only found on warm chalky hills. Many varieties are known in gardens, the most remarkable of which is the dwarf-box, so much used for the edgings of walks. Between this and the arborescent form the difference is so great, that one wonders how they can be both the same species, and Muller and others have even considered them distinct. But De Candolle states, that the wild plant in France is very variable in size, rising in some places to the height of 15 or 20 feet, and in rocky localities not exceeding 3 feet. It is from the arborescent *Buxus sempervirens* that box-wood is obtained. For the turner, for mathematical instruments, and especially for the uses of the wood-engraver, it is invaluable. The French employ it for coat-buttons, &c. The value of the box-wood sent from Spain to Paris is reported to amount to about 10,000 francs a-year. In 1815 the box-trees cut down on Boxhill, near Dorking in Surrey, produced upwards of 10,000l. (Macculloch, *Dict. of Com.*) Great quantities are imported from Turkey, and of fine quality. This wood sells in the London market for from 7l. to 14l. a ton, the duty of 5l. a ton included. The leaves have been employed, medicinally, as a tonic, a substitute for Peruvian bark.

Buxus Balearica, the Majorca box, is a handsomer plant than the other, with broader leaves, and a more rapid growth; but it is much more impatient of cold. Plants of it however live in the neighbourhood of London without protection. It is found wild in the neighbourhood of Luch in Majorca, on the hills, at the height of 1500 feet; and it also occurs abundantly on Mount Galatzio, where it is mingled with the palm-tree, but not in great masses. (Cambrésius.) We find nothing in books concerning the quality of its wood; but there is reason to suppose that a part at least of the Spanish and Turkey box-wood is furnished by this species.

BUZZARD. [FALCONIDÆ.]

BUZZARD'S BAY, a bay on the south coast of the State of Massachusetts, U. S. The peninsula of Barnstable projects in the form of a boat, the point of which, at Cape Cod, is curved like a ram's horn; Buzzard's Bay forms what may be termed the top or opening of the boat. The neck of land which connects the peninsula with the rest of Massachusetts, between Cape Cod Bay and the head of Buzzard's Bay, is only about four miles in breadth. This bay was entirely frozen over early in February, 1836, a circumstance which has not happened for many years. In the harbour the ice was from eight to twelve inches thick. The parallel of about 41° 35', and the meridian of 71° 15' W., intersect each other in Buzzard's Bay.

BYBLUS, an ancient town of Phœnicia, now called Jobbah, and situated nearly half way between Tripoli and Beirut, by the sea-coast, and at the foot of a mountain which is one of the lower range of Libanus. The town is enclosed by a wall, some parts of which appear to be of the time of the crusaders. There is a small castle, in which the Emir Beshir of prince of the Druses keeps about forty men.

(Burckhardt's *Travels in Syria*, 1812.) The celebrated Jewish writer Philo was a native of Byblus. This place was once famous for the temple of Adonis. (Maudrell, *Journey from Aleppo to Jerusalem*.)

[Coin of Byblus, Brit. Mus. Copper. 150 gr.]

BYLAW. Bylaws are the private regulations of a society or corporation, agreed upon by the major part of its members, for purposes of self-government, or for more conveniently carrying into effect the object of its institution.

It is not every voluntary association to which the law of England gives the power of binding dissentient members by the enactments of the majority. Immemorial custom or prescription, or legal incorporation by the king, or some positive act of parliament, is necessary to confer this power of local or private legislation; and even in those cases the superior courts of law exercise the right of discussing the validity or policy of the bylaw, and of establishing its legality or declaring it to be void. In order to stand this test it must be reasonable and agreeable to the general policy of the law of England, and must not attempt to bind strangers unconnected with the society, or to impose a pecuniary charge without a fair equivalent, or to create a monopoly, or to subject the freedom of trade to undue restraint. The general object of a bylaw is rather to regulate existing rights than to introduce new ones or to extinguish or restrain the old.

The power of making bylaws is not absolutely confined to corporate bodies. It is in some instances lawfully exercised by a class of persons having no strict corporate character. Thus the tenants of a manor, the jury of a court-leet, the inhabitants of a town, village, or other district, frequently enjoy a limited legislative power of this kind, either by special custom or common usage. But in general the power is exercised only by bodies regularly incorporated, and in such bodies the power is inherent of common right without any specific provision for that purpose in the charter of their incorporation. The expediency of this power is so obvious that we cannot be surprised at meeting with proofs of its existence in all countries and at a very early date. The Roman code recognized a right among the confraternity of its corporations to bind one another by similar engagements, as long as they were not at variance with the public law (*Digest*, lib. xlvii. tit. 22), and professes to borrow this provision from the still more ancient code of Solon.

Our own term *bylaw* is of Saxon origin, and is formed by prefixing to the word *law* another word *by* or *bye*, which means *house* or *town*. Hence its primary import is a *town-law*, and in this form and with this meaning it is said to be found among the ancient Goths, the Swedes, the Danes, and other nations of Teutonic descent. (Cowell, voc. *Bylaws*; Spelman on *Feuds*, chap. ii., and the Glossaries under the head *Bilago*, or *Belligo*.)

The *birlaws* and *birlaw courts* of Scotland, mentioned by some of the jurists of that country, are said to present some analogies to our bylaws, and may perhaps be referred to the same origin.

The late act for the regulation of municipal corporations gives to the town councils a power of making bylaws for the good rule and government of the boroughs, and for the suppression of various nuisances; and of enforcing the observance of them by fines limited to 5*l*. It directs however that no bylaws so framed shall come into operation until they have been submitted to the privy council for his majesty's approval—a precaution resembling in some degree the provisions of the Statute 19 Hen. VII., c. 7, by which the ordinances of trading guilds were made subject to the approbation of the chancellor, treasurer, chief justices, or directors of assize.

It is in the *COURGE*, eldest son of John Byng of Wrotham of Buxton and Matlock, daughter of Mr. Johnson of assizes the higher temperature, 1663. He entered as a voyage at any hour of the day-years of age. From 1681 to This water has been long celein the land service with the

garrison of Tangiers, where he received promotion, first as ensign, afterwards as lieutenant. In the following year, while acting as lieutenant on board the *Phoenix* in the East Indies, he was desperately wounded in a gallant action with a Zinganesse pirate, whose vessel he boarded and sent to the bottom, himself being picked up out of the sea with difficulty as she went down. In 1688 he was particularly active in attaching the fleet to the interests of the Prince of Orange, and he afterwards served with distinction under Sir G. Rooke and Admiral Russell. He commanded a third-rate in the successful expedition to Vigo in 1702, was made rear-admiral of the red in the year following, and received the honour of knighthood after the battle of Malaga in 1704. In 1706 he was commissioned vice-admiral of the red, and returned member of parliament for Plymouth, which borough he represented till he was created a peer in 1721.

His continued and important services had already obtained for him the dignity of baronet in 1715. In 1718 he totally defeated a Spanish fleet off Messina, and he was finally rewarded with some of the highest professional honours, as Rear-Admiral of England, and Treasurer of the Navy: he was also made a Member of the Privy Council, Baron Byng of Southhill in the county of Bedford, Viscount Torrington in Devonshire, Knight of the Bath, and First Lord of the Admiralty, in which exalted station he died January 17, 1732-3.

BYNG, JOHN, fourth son of the preceding, by Mary, daughter of James Master of East Langdon, in the county of Kent, Esq., was born in 1704, and entered early into his father's profession, in which he made the usual progress through subordinate stations. In 1756 he was appointed to command a squadron of ten ships of the line in the Mediterranean, destined for the relief of Minorca, at that time menaced by the French, and hoisted his flag accordingly on board the *Ramilles*. His equipments were by no means adequate to the service required, and on touching at Gibraltar to take in provisions and to refit, he learned that not less than twelve sail of the line, numerous frigates, and a large flotilla of transports from Toulon, had already landed 19,000 men in Minorca, and that the whole of the island, excepting Fort St. Philippe, was reduced. A council of war declared, on the unanimous authority of officers well acquainted with the island, that relief under these circumstances was impossible. Nevertheless Byng proceeded, and made an unsuccessful attempt to establish a communication with the garrison by his frigates. An engagement with the French squadron, under the Marquis de la Galissonière, ensued, and the fleets separated after an indecisive action, in which Byng took little part. The clamour raised at home was more directed against the ministry, who had neglected to fit out the fleet properly, than against the admiral, who had fought languidly; and the cabinet weakly and wickedly resolved to sacrifice Byng in the hope of securing their own reputation. They were assisted in this design by his professional unpopularity: his habits were austere; he was a rigid disciplinarian; and he had no brilliant former service to urge in his favour. He was accordingly superseded, and brought to a court-martial. It appeared from the evidence that he had not been anxious to engage; but ample testimony was borne to his courage. In his defence he inveighed against the policy of the enterprise, showed the little chance of victory which the crippled state of his ships permitted him to entertain, and the calamitous results which must have followed defeat. After a long trial he was found guilty of not having done his utmost, sentenced to be shot, but unanimously recommended as a proper object of mercy. The intrigues of his political enemies however prevailed: the press was employed against him; and Mallet, an able but venal writer, led the van; and in spite of many representations in his favour, the sentence was executed at Portsmouth on March 17, 1757. Byng met his fate with calmness and fortitude, and posterity has done ample justice to his memory.

BYNKERSHOEK, CORNELIUS VAN, was born at Middelburg in Zealand, on the 29th of May, 1673. His father, who was a merchant, paid great attention to his education. He was sent, when about seventeen years of age, to the University of Franeker, at that time a seat of learning of considerable reputation, where, after two years' study, he began to apply himself sedulously to jurisprudence, and in the course of the two following years wrote three disputations, which gained him great credit by the erudition and

judgment displayed in them. From this we may infer that the tone and character of his mind were early formed, as the qualities of which he then gave promise were those which peculiarly distinguished him in after-life, and on which his reputation mainly rests. After taking the degree of Doctor in the year 1694, he went to practise as an advocate at the Hague, where was held the supreme court of justice for the provinces of Holland, Zealand, and West Friesland.

In the year 1699 he is said to have edited a Dutch journal, which was soon suppressed as being too satirical. At all events it seems to have caused little interruption to his severer occupations, for in the writings which he has left behind him we find ample evidence of the zeal and industry with which he devoted himself, through the whole of a long and laborious life, to the study of jurisprudence.

In the year 1703 he was elected by the states-general a member of the Supreme Court. As such he was called upon to administer the common law of his own country, which, as he describes it, besides being grossly defective, was vague, uncertain, and obscure; so that frequently the further an investigation was carried, the greater was the perplexity it led to.

Where the law of Holland failed, his colleagues on the bench, afraid of shocking themselves with the technicalities of the Roman law, ran into the opposite extreme, and professing to be guided by the light of natural equity, soon lost themselves in a maze of uncertainty. Bynkershoek saw and pointed out the necessity of having some fixed standard to appeal to. He had always admired the Roman law for its manly simplicity, and valued it highly as furnishing the soundest principles of legal decision. Having now a practical object in view, he pursued his studies with greater ardour. About the year 1710 he published his first work of any great importance, the '*Observationes Juris Romani*,' consisting, as its title imports, of a collection of detached dissertations and criticisms.

Neither in this nor in any of his subsequent works does he aim at being a systematic writer. He did not study the Roman law merely in its aggregate form, as it stands in the compilations of Justinian; he rather sought to become acquainted with it more thoroughly, by investigating its origin, tracing its progress, and making himself familiar with its character. Accordingly, he does not confine his attention to points of practical importance only, but examines with unwearied research, and in a spirit of bold yet judicious criticism, subjects of every kind, setting former interpreters right where they were mistaken, and leading the way where they were at fault.

In the year 1719 appeared under the title of '*Opuscula varii Argumenti*,' a collection of treatises, which he had written at different times. One of these, which he had before published in 1695, soon after his coming to the Hague, contained the substance of his three academical disputations.

On the 26th of May, 1724, he was appointed by the States General president of the supreme court: but the activity of his intellect was not slackened by promotion, nor confined to the practical duties of his office. He published in 1730 another collection of treatises, under the title of '*Opera Minora*,' all of which had previously appeared separately at various times between 1697 and 1721.

In 1733 appeared four more books of '*Observationes Juris Romani*,' written in continuation of the former work of the same name, which he had published more than twenty-two years before. About the same time he retired from the bench, of which he had been forty years a member. His retirement however was not a period of indolence. 'Having now more leisure than formerly, I will do my utmost,' he says, 'to render a good account of it to the world.' His labours were however henceforth turned into a different channel. He gave up the study of the Roman law, and applied himself for the last years of his life to the task of laying before the world the learning which in the course of his study and his practice he had acquired on two very important subjects—international law, and the law of his own country. On the former of these he had already written two treatises, which are printed among his '*Opera Minora*.' The one, '*De Dominio Maris*,' which originally appeared in 1702, as an appendix to another dissertation, has always been appealed to with respect on a difficult and still disputed question. The other, '*De foro Legatorum Competenti*,' was first published in 1721, and was soon after translated into French by Barneyrre. In the year 1737 he

produced a more important work, '*Questiones Juris Publici*,' in two books; the first of which treats of war and peace, and the second is on miscellaneous subjects. The '*Questiones Juris Publici*,' as well as the treatise '*De foro Legatorum*,' though founded too exclusively on Dutch authorities, and written with too exclusive a reference to Dutch institutions, so that they appear to treat rather of the public law of Holland than of international law in general, have nevertheless been regarded by the publicists of all nations as works of the highest authority and most universal application.

The next and last labour undertaken by Bynkershoek was on the laws of his own country, '*Questiones Juris Privati*.' He did not live to complete the work, but as much of it as was prepared for publication at the time of his death appeared soon afterwards, under the superintendence of an anonymous editor, supposed to be his son-in-law, W. Pauw.

Besides his published works, Bynkershoek had employed himself during the whole of his professional life in the execution of two very laborious undertakings. One of these, which he called '*Observationes Tamultuariæ*,' consisted of notes which he had taken of the decisions and proceedings of the supreme court. The other, a work of still greater interest and importance, was a collection of all the scattered laws of his own country, whether existing in the enactments of the several legislative powers which had successively prevailed there;—in the decisions of the courts, the practice of the bar, or the customs and statutes of particular cities and districts. This immense mass he had digested, so as to form a complete '*Corpus Juris Hollandici et Zelandici*.' These two collections were intended solely for his own use; and he gave express orders in his will that they should never be published. It is to be regretted that his will should have been so religiously obeyed. The latter work, in particular, must have contained a history of the jurisprudence of Holland during the middle ages, which in the hands of Bynkershoek would hardly fail to throw much light on the extent to which the Roman law prevailed, and the influence which it had on the institutions and customs of the Teutonic races.

Bynkershoek had long suffered from asthma; to this, at last, was added dropsy on the chest, of which he died on the 16th of April, 1743. He was twice married; and by his first wife left six daughters. A complete edition of his works was published at Geneva, in 1761, in folio, by Vicat, professor of law at Lausanne; and another in two volumes folio, at Leyden, in 1766.

BYRON, LORD GEORGE GORDON, was born on the 22nd of January, 1788, in Holles Street, Cavendish Square, London. His descent dates from the time of the Norman conquest of this island. The Byrons, or Brons, who had been knights and baronets long before, were first made lords during the reign of Charles I., whose cause they espoused in opposition to that of the Commons of England. Notwithstanding his ancient lineage, of which he was always proud, Byron, owing to the imprudence and vices of his father (Captain Byron, nephew to the then lord), was born and brought up in what, considering the notions of his class, must be called poverty. Owing to an accident attending his birth, one of his feet was distorted, a defect which was a source of pain and mortification to him during the whole of his life.

In 1790, when he was only two years old, his mother, who had separated from her husband, retired with her child to Scotland, her native country, and established herself in humble lodgings in the town of Aberdeen. Proud, impetuous, and of a most inflammable temper, this unfortunate woman was not at all fitted to correct those hereditary vices which Byron in after years was accustomed to say were strong within him. The most important of all the parts of education is that for which the child stands indebted to its mother, and nothing could well be worse than the poet's maternal tuition and example. As for his father he took no charge of him, but withdrawing to the continent, in order to escape his creditors, he died at Valenciennes in 1791. When about five years old, Byron was sent to a day-school at Aberdeen, kept by one Bowers, who received from the poet's mother five shillings a quarter for such instruction as he could give. After staying rather more than a year at this school, he was placed under the tuition of a poor but well-informed Scotch clergyman, called Ross, who taught him to read. From the care of Mr. Ross his mother re-

moved him to that of Mr. Paterson, the son of his shoemaker, who taught him a little Latin, and attended to him with much kindness, until Mrs. Byron sent him to the free grammar-school of Aberdeen, where he was studying when the death of the lord, his grand-uncle, recalled him to England, and to the enjoyment of such a provision as suited a peer of the realm in his minority. This uncle, to whom he succeeded, was a man of fitful passions, and a melancholy occurrence had thrown a gloom over the last thirty years of his life. In a duel, which some people say was rather a chance scuffle arising out of the heat and intoxication of the moment, he killed his neighbour and relative Mr. Chaworth. The House of Peers, before whom he stood his trial in 1765, acquitted him, but his own conscience and his country neighbours never did. He shut himself up in his patrimonial mansion, the old and then melancholy Abbey of Newstead in Nottinghamshire, and thenceforward led an unsocial and eccentric course of life. He took no interest in his heir, who was destined to illustrate the proud name of Byron; he never seems to have exercised any pecuniary generosity towards him, and it is said that, on the rare occasions when he mentioned him, it was always as 'the little boy who lives at Aberdeen.' In 1798, when the poet succeeded to his uncle's titles and estates, he was little more than ten years old. His mother, whose weak head was turned by the sudden change in her fortunes, immediately removed to Newstead Abbey, and took great pains to keep always before his eyes the fact, that, though only a boy, he was now a lord. To attend both to body and mind, she employed one Lavender to straighten his unfortunate foot, and a Mr. Rogers to instruct him in Latin. The former, who was an impudent quack, did him no good; but the latter, a respectable schoolmaster of Nottingham, improved him considerably by reading passages from Virgil and Cicero with him. In less than a year Byron's mother carried him to London, whence, after consulting more able surgeons, who could no more cure a deformity than the empiric had been able to do, she had him conveyed to Dulwich and placed in a quiet boarding-school, under the direction of the late Dr. Glennie. But for the indiscretions and constant interference of Mrs. Byron, Dr. Glennie might not only have made him a better scholar than he ever became, but have checked in the germ at least some of those infirmities of temper and those vices which embittered his after-years. He had not been two years under charge of this excellent man, when his mother removed him to Harrow, where, with the exception of the usual long vacations, he remained till 1805, when he was sent to Cambridge. During his stay at Harrow he was irregular and somewhat turbulent in his habits; but he frequently gave signs of a frank, noble, and generous spirit, which endeared him to his school-mates: he had no aptitude for merely verbal scholarship; his patience seems to have failed him in the study of Greek, but this might be the fault of the system under which he was taught. He however read a great deal, and by occasional fits of application laid in some store of miscellaneous knowledge. During his vacations his mother continued to spoil him by alternate fits of harshness and indulgence. She introduced him to masquerades, and other scenes of excitement and fashionable follies, before he was fifteen years old. It was at about this period of his life that he became acquainted with Miss Chaworth, the heiress of Annesley and descendant of the Mr. Chaworth whom his lordship's great-uncle had killed. We have no doubt that this very circumstance had a great effect on his excitable and romantic imagination. In one of his memorandum-books he wrote, 'Our union would have healed feuds in which blood had been shed by our fathers; it would have joined lands broad and rich; it would have joined at least *our* heart, and two persons not ill matched in years—she was two years my elder.' His lordship had fancied himself in love two or three times before, but this more than half-imaginary passion for Mary Chaworth seems to have haunted him almost to the last hours of his existence, and he always persisted in saying, that had he been united to her he should have proved a better and a happier man. The young lady treated him as a clever, warm-hearted, but capricious school-boy, a friend and nothing more, and a year or two after her first acquaintance with the poet she gave her hand to Mr. John Musters, a gentleman of Notts. But all Byron's Harrow vacations were not spent in making love: he passed one of them in the house of the Abbé Rouffigny, in Took's Court, for the purpose of studying the French language; but he spent

most of his time in boxing and fencing, to the no small disturbance of the old Abbey establishment.

In October, 1803, he went to Trinity College, Cambridge, where he spent two years in the way that is not uncommon with young men of rank and fashion; but still, by fits and starts, he devoted himself to pretty hard study, and continued to cultivate that taste for poetry which first showed itself when he was about ten years old, and which he had never since permitted to lie wholly dormant. At the same time he indulged in many eccentricities, and caused great annoyance by keeping a bear, and several bull-dogs. But at Cambridge, as at Harrow, he frequently evinced the most generous and noble feelings, and chose his associates, with one or two exceptions, from among the young men of the greatest ability, wit, and character, to a few of whom he seems to have continued much attached in after-life. In 1806, while yet at college, he printed a very thin quarto volume of poems for private circulation. Of this edition Mr. Moore says there are but two or at the most three copies in existence. In 1807 he brought out, in one vol. 8vo., his 'Hours of Idleness,' which were very severely, but we cannot say altogether unjustly, handled in the Edinburgh Review. It was just such a collection of fugitive pieces as any tolerably read young man of nineteen might write: it was not less, and it certainly was not more, than this. In this volume we can scarcely discover any indication of the superior genius which he afterwards displayed; and there was in it an assumption of aristocratic airs that rendered the author peculiarly obnoxious to writers who advocated liberal principles. The severity of the reviewers seems to have produced a good effect on his lordship's muse, which was always too readily animated and injured by feelings of spite and revenge. He collected his poems, and brought them to bear on one point, he took more pains with his style, and in 1809 brought out his well-known satire, 'English Bards and Scotch Reviewers,' which, however faulty in parts as a composition, and blameable in moral feeling, was a wonderful improvement on his preceding productions. A few days before the publication of this satire he took his oath and seat in the House of Lords. He always complained bitterly that, on this trying occasion, young, inexperienced as he was, he was left to face the House alone—that none of his noble relations or connexions were there either to introduce him or receive him—that never was youth of his rank left in a state more lone and unfriended.

At one time Byron thought seriously of devoting himself to politics, and wrote to his mother that he 'must do something in the House soon.' He delivered two set speeches in the Lords, with indifferent success and a tolerable ignorance of the subjects on which he spoke, and then his senatorial ardour ceased altogether. This was after his return from his travels, in 1812.

On the 2nd of July, 1809, Lord Byron, in company with his friend Mr. John Cam Hobhouse, left England to travel in Portugal, Spain, Greece, Turkey, &c. He was absent two years on this classical tour, which enriched his mind with incidents and poetical imagery, and filled it with reflections of some of the finest and most melancholy scenery in the world. His travels, in fact, finished his poetical education, and nearly everything he wrote afterwards is redolent of the glowing atmosphere of the East, and bears more or less directly on the adventurous, impassioned narratives which he heard in 'the clime of the East,' and the land of the sun.

In March, 1812, Byron published the two first cantos of his splendid poem 'Childe Harold,' which at once gained him the very highest name among the poets of the day. The popularity of this production was as immediate as it was great, and he used to say, he went to bed one night, and, on waking the next morning, found himself famous. He was now sought after by the rich and great, who formerly knew him not, or avoided him; and he threw himself into the vortex of fashionable dissipation without much taste for its pleasure, and with little respect for the mass of those with whom he associated.

To pass over some minor productions, it was in the month of May, 1813, that his wild oriental tale, or rather fragment of a tale, 'The Giaour,' first appeared; this was followed, in December of the same year, by the 'Bride of Abydos,' another passionate Eastern poem, more consecutive as a narrative than the Giaour, and equally rich in scenic descriptions. In January, 1814, he published his 'Corsair,' one of the most applauded of his poems, and in our opinion far from being

one of the best of his productions. It, however, showed it an admirable mastery of the ten-syllable English verse and what he called 'the good old and now-neglected heroic couplet.' His descriptions of the islands and the scenery of the coast of Greece are justly beautiful: they are moreover correct pictures, must be felt by all who have travelled in those climes. His story, like all his stories, is badly constructed: the characters are not very dramatically sustained, and have little in them to lay hold of the heart when the fervour and passions of youth are passed. It is stated on the best authority that 12,000 copies of the *Corsair* were sold in one day. In May, 1814, he published his splendid ode on the first fall of Bonaparte. In August of the same year appeared his 'Lara,' an irregular sort of sequel and wind-up to the 'Corsair,' written in much the same style, but with rather less power. During the blaze of his poetical fame, and his intoxicating success in society, Byron was hardly ever happy, and he occasionally withdrew for considerable periods to the solitude of the old abbey at Newstead. In October, 1814, he was married to Miss Milbanke, a great heiress in prospect, but at the time possessed of little money, while the poet stood in need of a great deal. He was in fact so involved in his pecuniary affairs, that he tells us, he had nine executions in his house during the first twelve months of his marriage, besides having his door continually beset by duns. These were not circumstances likely to soothe the irritable temperament of Lord Byron: he sought a refuge from them in pleasures from home; and an utter incompatibility of character between him and his lady becoming every day more and more conspicuous, augured ill for this hastily-formed alliance. On the 10th of December, 1815, Lady Byron bore him a daughter, the Ada of his poems (now Lady King); and in the latter end of January she left his house with her infant, and retired to her father's residence in Leicestershire: the poet never saw his wife or child again.

At the end of February, 1815, he published his two poems, the 'Siege of Corinth' and 'Parisina.' On the 25th of April following, he set sail for Ostend, with a fixed determination never more to return to a country which had given him honours, titles, competent wealth, and fame.

On starting on his continental travels, he went through Belgium, up the Rhine, and then through part of Switzerland to Geneva, where he fixed himself for some time, his favourite companions there being the late Mr. Shelley, the poet, and Mrs. Shelley. He often crossed the lake to visit Madame de Staël at Coppet. His frequent voyages on the lake of Geneva, and excursions among the Alps, revived all his passionate adoration of sublime scenery. During his stay at the villa Diodati, near Geneva, he wrote the third canto of 'Childe Harold,' the 'Prisoner of Chillon,' 'The Dream,' and several of his fugitive pieces. In October, 1816, he left Switzerland for Italy, and by the middle of the following November, we find him at Venice, where he remained for more than three years, which were mainly spent in an alternation of literary labour and debauchery. We must, however, deduct from this long sojourn some three weeks, which he employed in visiting Rome in company with his friend Hobhouse, and a few excursions he made to Bologna and other places. In January, 1820, he took up his residence at Ravenna, where he involved himself with secret societies and Italian plots to overthrow the government of the pope. The brother and other near connexions of the Countess Guiccioli, a married woman to whom he had attached himself, were so seriously committed, that the papal government exiled them from the States of the Church. Upon this, the lady and her relatives took refuge in Tuscany, and ultimately fixed themselves at Pisa, whither Byron soon followed them in November, 1821.

Soon after his arrival at Pisa, he was joined by Mr. and Mrs. Shelley, and his party was subsequently increased by Mr. Leigh Hunt and family. Byron, Shelley, and Hunt started a work called 'The Liberal,' which was to appear periodically, and to be written and edited by the three conjointly. It was altogether a badly-devised scheme, and, after the irregular appearance of two or three numbers, the work stopped. In July, 1822, he was much affected by the death of his friend Shelley, who was drowned in a small pleasure-boat off the coast of Tuscany. In October he went to Genoa. Early in 1823 he received flattering overtures from the committee of friends to the Greeks esta-

lished in London for the purpose of aiding that people in their struggle for independence. His knowledge of the country, the beauty and energy of the many verses in which he had described her sad condition under the Turks, naturally directed attention to his lordship, who, after a short correspondence with the committee, determined not merely to assist in purse, but in person and with arms in his hands. With his usual haste and impetuosity, he prepared forthwith to leave Italy. During his stay in that beautiful country, he had written the fourth canto of *Childe Harold*; *Beppo*, a Venetian story; *Mazeppa*; *Manfred*; the *Lament of Tasso*; *Ode to Venice*; the *Prophecy of Dante* (wherein he imitated, not very successfully, the terza rima of the Italian); *Cain*, a *Mystery*; *Marino Faliero*, the *Two Foscari*, *Sardanapalus* and *Werner*, tragedies; the *Cantos of Don Juan* (the most astonishing of all his productions); the *Vision of Judgment*; and many fugitive pieces.

With his head full of warlike notions, Byron sailed from Genoa on the 14th of July; on the 19th he put into Leghorn to purchase gunpowder and other commodities for the Greeks, and sailing again on the 24th, he reached the island of Cephalonia in about ten days. He had scarcely arrived there and looked a little into the affairs of the Greeks, when he repented of his expedition. 'I was a fool,' he wrote to a friend, 'to come here; but being here, I must see what is to be done.' He, however, showed a talent for public business that surprised most people, and a degree of good common sense that contrasted very advantageously with the wild theoretic dreamings of many of the Philhellenes who had repaired to Greece.

At the end of December, 1823, his lordship sailed from Cephalonia, and after a narrow escape from a Turkish frigate landed at Dragomestri, a wretched seaport of the Greeks on the coast of Acarnania. In sailing from this point to Missolonghi he was near suffering shipwreck, and by an act of imprudence sowed the seeds of the malady that soon terminated his existence. On the 3rd of January, during a rough and cold night, he leaped into the sea, and swam a long way: two or three days after he complained of a severe pain in all his bones, which continued more or less to the time of his death. He reached Missolonghi on the 10th of January, 1824, where he found everything in a most perplexing and almost hopeless state of anarchy and confusion. He set to work with spirit and application, and again showed a great aptitude for the dispatch of public business. The weather was detestable and the place unhealthy. At the beginning of February he got wet through; on the evening of the 15th he was seized with a dreadful convulsive fit, and was for some time speechless and senseless. Soon after this paroxysm, while stretched on his bed faint with over-bleeding, a crowd of mutinous Suliotes whom he had engaged to fight for their country burst into his apartment brandishing their arms, and furiously demanding their pay. Sick and nerve-shaken as he was, Byron is said to have displayed great calmness and courage on this trying occasion, and his manner soon inspired the mutineers with respect and awe. At the end of January he had received a regular commission from the Greek government, and was appointed to the command of an expedition that was to besiege Lepanto, then in the hands of the Turks. The difficulties and obstructions encountered by his lordship in preparing and providing for this siege were perplexing and irritating in the extreme, and altogether too much for a man whose health was evidently undermined. Still, however, he would not listen to those who advised him to retire. 'I will stick by the cause,' said he, 'as long as a cause exists.'

On the 9th of April he again got wet through, and returned to Missolonghi in a state of violent perspiration. Fever and violent rheumatic pains ensued. On the following day he took a ride among the olive woods, but complained of shudders, and had no appetite. On the evening of the 11th he was much worse, and by the 14th he was evidently in danger. For several days he obstinately refused to let his medical attendants bleed him, and when he gave his consent the bleeding was too late. Inflammation fell upon his brain, and he expired at six o'clock on the afternoon of the 19th of April, 1824, being only 36 years and three months old. The bitter grief of his followers and attendants of all nations was a proof of his frequent kindness of heart, and his goodness as a master.

As a poet of description and passion he will always occupy a high place, though we doubt much whether he will preserve in after-ages the absolute supremacy which so many of his contemporaries gave him as his right. When, in the progress of taste and right feeling, the public mind shall be attuned to the deep, tender, and philosophic strains of Wordsworth, we are inclined to believe that the author of the 'Excursion' will rank higher than the author of 'Childe Harold.'

The least successful of Byron's productions, notwithstanding the admirable passages in which they abound, are his tragedies: the work which gives us the highest notion of his genius, power, and versatility is his 'Don Juan.' The Don is at times free and almost obscene, and the whole tendency of the poem may be considered immoral; but there are, scattered throughout it, the most exquisite pieces of writing and feeling,—inimitable blendings of wit, humour, raillery, and pathos, and by far the finest verses Byron ever wrote. He may be said to have created this manner; for the Bernese style of the Italians, to which it has been compared, is not like it. (*Letters and Journals of Lord Byron, with Notices of his Life, by Thomas Moore; Galt's Life of Lord Byron; Dallas's Memoir; Lady Blessington's Conversations with Lord Byron.*)

BYRON, JOHN, second son of William Lord Byron, by his third wife Frances, second daughter of William Lord Berkeley of Stretton, was born Nov. 8, 1723. He was engaged as midshipman on board the *Wager*, the store-ship which accompanied Lord Anson's squadron in his voyage round the world, commenced in September, 1740. That vessel, an old East Indiaman, fitted out as a ship of war, and deeply laden, was manifestly deficient in equipment, and the expedition was unfortunately delayed till a season very unfitting for the navigation on which it was to be employed. On the 15th of May the *Wager*, having before parted company with the remainder of the squadron in consequence of her bad sailing, struck on a sunken rock about the latitude 47° S. on the western coast of America. Her condition was so crazy that she soon afterwards bilged, and grounded between two small islands about a musket-shot from the shore. Her captain, who had succeeded to the command during the voyage in consequence of the death of his superior officer, appears to have rendered himself hateful to the ship's company by imperious and tyrannical conduct; and the crew, on the other hand, were mutinous and insubordinate. No hope of preserving the vessel remained, and the mariners were happy in being able to land upon a wild shore, which afterwards proved to be part of an uninhabited island, and the wretchedness of which may be inferred from the name which the sailors gave it, 'Mount Misery.' After several months' residence, part of the crew embarked in the cutter and long-boat to attempt the passage of the Straits of Magelhaens, and a homeward return by Brazil. The cutter was lost, but the long-boat, after undergoing incredible hardships and sailing more than 1000 leagues, arrived at the Portuguese settlements in Brazil. A narrative of this remarkable enterprise was published by two of the survivors, John Bulkeley and John Cummins, late gunner and carpenter of the *Wager*. Byron and his companions, after enduring the utmost extremity of famine, bad weather, cold, fatigue, hunger, sickness, and general destitution, and having made one useless attempt to quit the island, were relieved by a Chanos Indian cacique, who conveyed them to the island of Chiloe, after thirteen months had expired since the loss of the *Wager*. The hardships which the party endured defy abridgment, but the narrative which Byron published on his return to England in 1745 is among the most interesting accounts of nautical adventures with which we are acquainted. Byron was seldom unemployed; he afterwards served with some distinction in 1758 during the war against France; in 1760 he performed a brilliant service in destroying a French squadron in Chaleur Bay, and on the return of peace in 1764 he was despatched on a voyage of discovery to the South Sea, in command of the ships *Dolphin* and *Tamar*. Although his discoveries were by no means great, he may be considered as one of the ablest precursors of Captain Cook, in the preliminary volume to whose voyages, collected by Hawkesworth, Byron's journal occupies the first place.

He was afterwards, in 1769, appointed governor of Newfoundland. In 1778 he commanded the fleet destined to observe the movements of the French admiral M. d'Es-

taigne in the West Indies, but profiting by his great superiority in numbers (37 ships of the line to 21), eluded every attempt to bring him to close engagement. During this expedition he received the highest promotion which he attained, that of Vice-Admiral of the White. In 1748 he married Sarah, daughter of John Trevanion, Esq., of Cartrays, in the county of Cornwall, who outlived her husband only one month, and bore him two sons and seven daughters. Commodore Byron, as he is usually styled, died in London on April 10, 1788, in the enjoyment of a high and merited reputation for courage and professional skill.

BYSSOARCA, a subgenus separated by Swainson from the genus *Arca* of Linnaeus, and considered by the former as the sedentary type of that genus. The following is the subgeneric character given by Swainson in his second series of 'Zoological Illustrations.' Animal fixed by byssiform filaments to other bodies; shell transverse; umbones remote; valves gaping in the middle of the ventral margin.

'The animals of these shells,' says the author last quoted, 'affix themselves to other bodies by a particular muscle, which is protruded through the gaping part of the valves; they also adhere when young by the byssiform epidermis which covers the exterior. A specimen now before us, which we procured in the bay of Naples, perfectly exemplifies this singular property.' Mr. G. B. Sowerby has described several new species collected by Mr. Cuming on the western coast of South America and among the islands of the South Pacific Ocean, in the Proceedings of the Zoological Society of London for 1833. *Byssosarca* has been found moored to stones and shells at depths varying from the surface to seventy-five fathoms.

[Byssosarca Nom.]

1. Valves closed. 2. Valves closed, view of the hinge area. 3. A single valve, showing the hinge teeth and the interior of the valve. a. Umbones. b. Part of the ventral margin where the valves gape, to give room for the extrusion of the tendinous foot.

BYSSOMYA, a genus of conchiferous mollusks separated by Cuvier, and placed by him under his acephalous testacea between *Pandora* and *Hiatella*. De Blainville, who approves of Cuvier's separation, observing that though the shell differs little from *Saxicava*, the animal is very distinct, arranges it in his family of *Pyloridea* between *Saxicava* and *Rhomboides*.

Generic Character.—Animal more or less elongated, subcylindrical, elongated behind by a long tube, which is bifurcated at its extremity only. A hole at the lower and anterior part of the mantle for the passage of a small conical, canalculated foot, and of a byssus situated at its posterior base. Two strong adductor muscles.

Shell often irregular, covered with a strong epidermis, oblong, strongly striated longitudinally, equivalve, very inequilateral, obtuse and wider before, and attenuated or rostrated, as it were, behind. Umbones but little developed, though distinct and a little curved forward. Hinge

toothless, or only having a rudiment of teeth under the cœcelet. External ligament rather long. Two strong, distant, and rounded muscular impressions.

Example, *Byssomya Pholadis*, *Saxicava Pholadis* of Lamarck. The species inhabits the northern seas, living in the fissures of rocks, in company with *Mytili* (mussels), and attached by its byssus; but sometimes it buries itself in the sand or lodges in small stones, the roots of *fuci*, and even in the polymorphous *millepora*: in the latter cases, according to O. Fabricius, it is without byssus.

[*Byssomya Pholadis*.]

BYSSUS (conchology), the name of a long, delicate, lustrous, and silky fasciculus of filaments, by which some of the conchiferous mollusks (the *Mytilacea*, mussels, and *Malleacea*, Hammer oysters, for example) are moored to submarine rocks, &c. This is not, as some authors have stated, a secretion spun by the animal, but, according to De Blainville, an assemblage of muscular fibres dried up in one part of their extent, still contractile and in a living state at their origin, a condition which they enjoyed throughout their whole length at the period of their attachment. The tendinous foot of *Byssarca* and *Tridacna* seems to be a step towards the organization of a true byssus. In the great *Pinna* of the Mediterranean this substance is well and largely developed, and its situation is in a fleshy sac or sheath at the base of the foot, which is attached towards the middle of the abdominal mass of the animal. In Italy the byssus is manufactured into various articles; and there are few museums without a glove or a stocking woven out of this substance.

BYSSUS (Βύσσος). It has been a subject of some dispute whether the byssus of the ancients was cotton or linen: but recent investigations have determined that it is linen, and not cotton; at least so far as the term has been applied by Greek and Roman writers to mummy-cloth. Herodotus states, that the Egyptians wrapped their dead in the cloth of the byssus; and it has been shown by microscopic observations, that every specimen of mummy-cloth yet examined is made of linen fibre. The name byssus came probably from the Phœnicians, and may be derived from בִּיטְּ butz. (Buxtorf's *Lexicon*.) It is possible that writers later than the time of Herodotus may sometimes have applied the term indifferently either to cotton or linen cloth. Cotton was known in the time of Herodotus (B.C. 484—408), who calls it tree-wool (ῥιπὶον ἀπὸ ξύλου): but there is no evidence to prove that it was then cultivated in Egypt, or in any other country except India; or that it was in common use in Egypt. His remark, so far as they go, seem to imply that the commodity was a rarity. (Vol. XXX. *Library of Entertaining Knowledge*, *Egyptian Antiquities*, Vol. II., Part I., Chapter v., pp. 182—196.)

BYZANTINE HISTORIANS is the name given to a series of Greek historians and writers who lived under the Eastern or Byzantine empire between the 6th and the 15th centuries. They may be divided into two classes:—1. The historians properly so called, whose collected works constitute a complete history of the Byzantine empire from the time of Constantine the Great to the taking of Constantinople by the Turks; and 2. The general chroniclers who have attempted to give a chronography of the world from the oldest times. The *historians* are:—1. Joannes Zonaras of Constantinople, first an officer of the imperial court and afterwards a monk of Mount Athos, who died about 1118, and wrote the 'Annals of the World,' in 18 books.

In the first part of his work he belongs to the class of general chroniclers or compilers, but from the time of Constantine he treats more particularly of the history of the Eastern Empire, which he brings down to the death of Alexius I. Comnenus in 1118. 2. Nicetas Acominatus of Chonæ or Colossæ in Phrygia, who filled several high offices in the court of Isaac Angelus, and died at Nicæa in 1216. His 'History of the Byzantine Emperors' in 21 books begins with 1118 and ends with 1206. 3. Nicephorus Gregoras of Heraclea enjoyed the favour of Andronicus Palæologus the elder of the Palamites; but owing to the controversy, he was confined in a convent by the Patriarch, in 1351, where he died. He wrote a Byzantine, or, as he styles it, a 'Roman History' in 38 books, of which the first 24 only have been printed; containing the history of the Byzantine Empire from 1204 to 1331. The 14 remaining in MSS. bring the history down to 1359. 4. Laonicus (Nicolas) Chalcondylas of Athens wrote a 'History of the Turks and of the Downfall of the Greek Empire' in 10 books, to the year 1452. An anonymous writer has continued the history of the Turks down to 1565.—These four writers form by themselves an entire history of the Byzantine Empire from the time of Constantine to the Turkish conquest. The following writers have treated of detached periods of the same history, or have written the lives of particular emperors. 5. Procopius of Cæsarea in Palestine, the most celebrated of the Byzantine writers, wrote the 'History of his own Time' in 8 books, to the year 545. He also wrote a 'Secret History' (Anecdota) of the reign of Justinian down to the year 553, which, as to the manner in which he speaks of that emperor and of his court, contrasts singularly with the panegyric tone of his former work. 6. Agathias of Myrina in Æolis, a poet as well as historian of the 6th century, is well known for his Anthology and his *Daphniaca* or amatory verse. [ANTHOLOGY.] He studied first at Alexandria, from whence he removed to Constantinople in 554, being then about 18 years of age, and applied to the study of the law, in which he became eminent. He was surnamed 'Scholasticus,' a word which then meant an advocate. He wrote a History in five books of the years 553—59 of Justinian's reign, which forms a sequel to Procopius. He died about 582. Agathias is one of the most trustworthy Byzantine historians; inferior to Procopius in talent and information, but superior to him in honesty. The impartial manner in which he speaks of the various parties and sects, and particularly of the two great religious systems which divided the world in his time, has made it a matter of dispute whether he was a Christian or a Pagan. His account of the Persians and their celebrated king Chosroes or Nushirvan is much valued for its accuracy and fairness. 7. Menander of Constantinople, surnamed Protector, continued the history of Agathias to the year 582. Menander's history is lost, but fragments of it are found in the works of Constantine Porphyrogenetus, which relate to the history of the Huns, the Avari and other northern and eastern races, and also to the negotiations and missions between Justinian and Chosroes. All that remains of Menander has been published by Bekker and Niebuhr, Bonn, 1829. 8. Joannes of Epiphania wrote a history of the Persian war under the emperor Mauricius, which has never been printed, and the only MS. of it known is in the Heidelberg collection. 9. Theophylactus Simocatta lived in the first part of the 7th century, and wrote a history in 8 books, from 582 till the death of Mauricius in 602. 10. Joannes, a monk of Jerusalem, in the 8th century, wrote a brief history of the Iconoclasts, which was published by Combéffis for the 'Corpus Historicæ Byzantinæ,' together with an anonymous work against Constantine IV., probably written by the same monk. 11. Theodosius, a monk of Syracuse, in the 9th century, has left a narrative of the taking of Syracuse by the Spanish Arabs. It was published, for the first time, by Hase, with the 'History of Leo Diaconus,' Paris, 1819. 12. Constantinus VI. Porphirogenetus wrote the life of his grandfather Basilius the Macedonian, from 867 to 886. He also wrote several other works which may serve as illustrations of the Byzantine history, such as 'De Administrando Imperio,' on the Administration of the State, addressed to his son Romanus; 'De Ceremoniis Aulæ Byzantinæ'; 'De Thematisibus,' or military divisions of the empire. He also caused several learned men to compile a kind of historical library out of the works of all previous historians. This great compilation was divided into 53 books, of which the titles of 26 only are known. One was on the succession

of kings, another on the art of generalship, &c. Under each of these heads, passages from the various historians bearing upon the subject were collected. Three books alone, more or less mutilated, have come down to us. One, entitled 'De Legationibus,' is an account of the various embassies between the Romans and other nations; another 'De Sententiis,' and the third 'De Virtute et Vitio.' 13. **Genesis** of Byzantium wrote a history of Leo the Armenian, Michael II., Theophilus, and Michael III., embracing the period from 813 to 867. 14. **Leontius** of Byzantium, called the younger, wrote also a history of the same period, to serve as an introduction to Constantine's life of Basilus. 15. An anonymous writer has left a continuation of Constantine's life of Basilus, embracing the lives of Leo VI. and his brother Alexander, of Constantine VI. himself, and his son Romanus. 16. **Joannes Cameniata** of Thessalonica wrote an account of the taking of that city by the Saracens in 904, of which he was an eye-witness. 17. **Leo Diaconus** of Kaloë, born about 950, accompanied Basilus II. in his wars against the Bulgarians, and wrote the lives of Romanus, Nicephorus Phocas, and Tzimisces, from 959 to 975. 18. **Michael Constantine Psellus** wrote a history from the death of Tzimisces in 975 till the accession of Constantine Duca in 1059. It has not yet been published. 19. **Nicephorus Bryennius**, the husband of Anna Comnena, wrote 'Historical Materials,' being a kind of memoirs of the Comneni family, to the accession of Alexius I. 20. **ANNA COMNENA** has written the history of her father Alexius. 21. **Joannes Cinnamus**, who lived towards the end of the 12th century, was imperial notary at Constantinople. He wrote the lives of John Comnenus, and of Manuel his son, from 1118, when Anna Comnena ends, till 1176. Like his predecessors he is partial against the Latins or Franks, and especially unjust towards Roger I. of Sicily, who was a great man for his time, though an enemy of the Byzantines. 22. **Georgius Acropolita**, born in 1220 at Constantinople, filled several important offices under Michael Palaeologus, and died in 1282. There are two works under his name, one styled a 'Chronography,' and the other a 'Short Chronicle of the late Events,' both referring to the period from 1204, when the Franks took Constantinople, to 1261, when they were finally expelled. Acropolita has also written a 'General Chronicle from the Creation to the taking of Constantinople by the Franks,' which is not yet printed. 23. **Georgius Pachymeres**, born at Nicæa in 1242. After the recovery of Constantinople by the Greeks he was raised to high offices in the state. He wrote a 'Byzantine History,' which forms a continuation to Acropolita's work, and comes down to 1308. Pachymeres is a faithful but dull writer. He wrote also several philosophical works and a history of his own life. 24. **Joannes Cantacuzenus**, after his abdication of the empire in 1355, retired to a convent where he wrote a Byzantine history from 1320 to 1357. Cantacuzenus is in general a good authority for the history of that period in which he acted an important part, though he is of course somewhat partial in his own cause. 25. **Joannes Duca**, of the imperial family of that name, fled from Constantinople at the time of the Turkish invasion, and took refuge at Lesbos under the Genoese adventurer Prince Castelluzzi. He wrote a Byzantine history, which begins from Adam, after the fashion of the chroniclers, and is but a brief general chronicle as far as the year 1311, after which his account becomes more circumstantial, being more especially occupied with the history of the latter period of the eastern empire: it ends with the taking of Lesbos by the Turks, in 1462. This latter part therefore forms a continuation to Cantacuzenus. 26. **Joannes Anagnostes** of Thessalonica has left an account of the taking of that city by the Turks in 1430. 27. **Joannes Cananus** has written a history of the war against Sultan Murad II. in 1420. 28. **Georgius Phranza**, born in 1401, of a family related to the Palaeologi, filled some of the highest offices in the state under the last emperors. He was made prisoner by the Turks at the taking of Constantinople, was sold as a slave, recovered his liberty, and took shelter for a time with Thomas Palaeologus, prince of Peloponnesus. When the Turks invaded that part of Greece Phranza escaped to Italy, and at last became monk at Corfu in 1468. There he wrote his 'Chronicle' in 4 books, which begins with 1260 and ends with 1477, embracing the whole history of the Palaeologi. The work of Phranza is most valuable, though it is full of digressions upon religious controversies, the origin of comets, &c. The following are the general chroniclers properly so

called, who are also included under the general appellation of Byzantine historians:—1. **Georgius Syncellus** lived in the eighth century. He wrote a 'Chronography' from the beginning of the world to the time of Diocletian, in which he has availed himself of Eusebius and Africanus. 2. **Theophanes Isaacius** of Constantinople, who died about 817, continued the chronicle of Syncellus from 280 till 813. 3. **Joannes of Antioch**, called Malaktas, a Syrian word meaning a rhetor or sophist, lived in the ninth century, and wrote a chronicle from Adam till 866. 4. **Joannes Scylitzes**, who lived in the eleventh century, wrote a 'Short History' or chronicle from 811 till 1057, which he afterwards recast and continued till 1081. 5. **Leo Grammaticus** wrote a chronography, which is a continuation of 'Theophanes', from 813 to 949. 6. **Justinus** has also left a chronicle embracing the same period as Leo's. 7. **The Chronicle of Pseudo-Eusebius**, called also Alexandrian Chronicle, is attributed by some to Georgius the Bishop of Alexandria, who lived in the seventh century. It is also called 'Fasti Siculi,' because the MS. was discovered in Sicily. It extends from the beginning of the world to 1042. 8. **Georgius Hamartolus**, an Archimandrite, wrote a chronicle to the year 842, which is yet unedited. 9. **Joannes of Sicily** wrote in the ninth century a chronicle from the creation of the world till 866, which is not yet printed. An anonymous continuation of it till 1322 exists in the imperial library at Vienna. 10. **Nicephorus**, Patriarch of Constantinople in the first part of the ninth century, has left a Breviarium Chronographicum, or short chronicle, from the creation to the author's death in 828, giving series of the kings, emperors, patriarchs, and bishops, &c. He wrote also a Breviarium Historiarum, or general history of events from 602 to 770. 11. **Julius Pollux**, not the author of the Onomasticon, wrote a chronicle with the title of 'Historia Physica,' from the creation to the reign of Valens. A MS. in the national library at Paris brings it down to the death of Romanus the younger in 963. This chronicle is chiefly engrossed with church matters. 12. **Georgius Cedrenus**, a monk of the eleventh century, wrote a chronicle compiled chiefly from the former chronicles of Scylitzes and others. It is mixed up with fictions, and is one of the least valuable in the Byzantine collection. 13. **Simeon Metaphrastes** filled some high stations at the imperial court in the first part of the tenth century. His chronicle comes to 963, and has the merit of being compiled from the works of ten lost writers who lived between Leo Grammaticus and Michael Psellus. 14. **Hippolytus of Thebes** lived towards the end of the tenth and the beginning of the eleventh centuries. He wrote a chronicle from the birth of Jesus Christ to his own time. 15. **Michael Glykas**, whose country and age are not ascertained, wrote a chronicle from the creation to the year 1118. It is valuable both for its historical and its biblical references. 16. **Constantine Manasses**, who lived in the twelfth century, has left a chronicle in verse down to 1081. 17. **Ephraemius**, believed to be the son of John XII., patriarch of Constantinople, wrote a chronicle in iambs of the emperors, from Julius Cæsar to the restoration of the Byzantine empire after the Frankish invasion. It is followed by a chronology of the patriarchs of Constantinople till 1313. The whole poem contains 10,410 lines. Angelo Mai published it first in his Vatican collection of inedited MSS. 18. **Joel** wrote a short general chronicle of the world to the Frankish invasion of Constantinople in 1204. 19. **Theodosius of Melite** has left a chronicle which is not yet printed. Professor Tafel of Tübingen has published a notice of this writer: 'De Theodosio Meliteno inedito historiarum Byzantinæ Scriptore,' 4to. Tübingen, 1828, from the MS. of his chronicle which is at Tübingen, and which was brought from Constantinople by St. Gerlach in 1578. 20. **Hesychius of Miletus**, who lived under Justinian and Justinian, wrote a history of the world, which is lost, except a valuable fragment on the origin of Constantinople, which has been extracted and preserved by Codinus.

Besides the above historians and chroniclers there are other Byzantine authors who have written on the statistics, politics, antiquities, &c. of the Roman empire, whose history properly so called they serve to illustrate, and who are generally included in the collection of Byzantine historical writers. Among these Procopius stands foremost by his curious work, 'De Aedificiis Domini Justiniani,' lib. vi., which contains a brief notice of the towns, temples, convents, bridges, roads, walls, and fortifications built or repaired under the reign of Justinian. 2. **Joannes Laurentius**, called

Lydus from his being a native of Philadelphia in Lydia, lived under Justinian, and was both a poet and prose writer. He has left a work 'On the Roman Magistracies,' which affords valuable assistance for the knowledge of Roman civil history. The MS. was first discovered by Choiseul Gouffier and Villoson in the library of Prince Morousi at Constantinople in 1821, and is now in the public library at Paris. Hase at Paris, 1812. In

the same found work of Lydus, 'De science,' which has been also published by Hase in 1823. 3. Hiero- quish him from the Synecdemus, or tra-

guide, in which he de- the 64 provinces of the Eastern empire, and the 355 cities and towns contained in it.

It has been published in several collections, among others in Banduri's 'Imperium Orientale,' Paris, 1711. Some suppose that Hierocles lived under Justinian, others later; but certainly previous to the tenth century. 4. Theop-

phylactus, archbishop of Aehris in Bulgaria in the latter part of the eleventh century, wrote a work 'on the Education of Princes,' intended for the young Constantine, the son of Michael VII. Parapinaces. It is published in Banduri's 'Imperium Orientale,' 5. Alexius I. Comnenus wrote

'Novum Rationarium,' or Inventory of the Revenues of the State, in imitation of Augustus. It has been published in the collection of the Benedictines, Paris, 1688. 6. A monk, of unknown name, who lived under Alexius I., wrote a book on the antiquities of Constantinople, which gives a description of its buildings, monuments, &c. It is inserted in Banduri's 'Imperium.'

7. Matthæus Blastares, a monk, wrote, about 1305, an account of the numerous household charges and offices in the imperial palace of Constantinople, which is inserted in the eighteenth volume of the Venetian edition of the 'Corpus Hist. Byzant. Scriptorum.'

8. Georgius Codinus, surnamed Curopalates, lived in the latter age of the empire, and wrote 'on the Dignities and Offices of the Church and Court of Constantinople.' He has also left 'Extracts from the Chronicle of Hesychius on the

Origin and History of Constantinople.' 9. The Emperor Manuel Paleologus wrote a book 'on the Education of Princes.' He also wrote 'a Dialogue with a Turk held at Ancyra in Galatia,' where Manuel was once stationed in winter-quarters with his auxiliary corps serving under

Sultan Bajazet. This work, which is yet unpublished, is said to give an interesting view of the tottering condition of the once mighty empire towards the beginning of the fifteenth century. There are also 66 unpublished letters of Manuel in the public library at Paris, which contain interesting allusions to the history of that period. (See Hase's

Notice et Extraits des Manuscrits de la Bibliothèque du Roi, vol. ix.)

Most of the above Byzantine historians, chroniclers, and other writers were collected and published in the great edition made by order and at the expense of Louis XIV., in 36 vols. fol. Paris, 1645—1711. The jesuits Labbe and

Maltrait, Petau and Poussines, the Dominicans Goar and Combéllis, Professor Fabrot, Charles du Fresne Seigneur du Cange; Allacci, the librarian of the Vatican; Banduri, li-

brarian at Florence; Boivin, the king's librarian at Paris; and Bohilland, a mathematician, were each entrusted with parts of this splendid work. The Greek text is accompanied with a Latin translation, and notes. The last volume contains the Arabian chronicle of Abu Ben Raheb, which serves to

illustrate Byzantine history.

Another edition was published at Venice in 23 vols. fol. 1729, and the following years, which contains several works omitted in the Paris edition, such as Phranza, Genesis, and Malalas. Others were published separately afterwards

as a supplement to the Venice edition: 'Opera Georgii Pisidae, Theodosii Diaconi et Corippi Africani,' Rome, 1777, folio. 'Julii Pollucis Historia sacra,' Bononiæ, 1779, folio.

'Constantini Porphyrogeneti libri ii. de Ceremoniis Austri Byzantine,' 2 vols. fol. Leipzig, 1751. 'Leonis Diaconi Caloensis Historia,' by Hase, fol. Paris, 1819. Several of the Byzantine historians, however, still remain inedited, as we have above observed.

A new edition of the Byzantine historians was projected by the late B. G. Niebuhr: 'Corpus Scriptorum Historiæ Byzantiæ. Editio emendatior et copiosior,' etc. 8vo. Bonn, 1828, and following. It is proceeding, since Niebuhr's death, under the care of Bekker, Dindorf, and other philologists. About 20 volumes have already appeared. (For a

full account of the Byzantine writers see Schoell's *History of Greek Literature*, and Fabricius, *Bibliotheca Græca*, editio nova, vols. vii. and viii.)

BYZANTIUM (*Byzantion*, on the coins sometimes *Byzantion*), an ancient Greek city, which occupied part of the site of modern Constantinople. According to Eusebius and other ancient authorities, Byzantium was founded by a colony from Megara, OI. 30, 3, or 658 B.C., 12 years after

the building of Calchedon,* on the opposite or Asiatic shore of the Bosphorus, by another colony from Megara. Others say that the first colonists of Byzantium were a mixed people from Megara and Argos. They were, how-

ever, a Dorian colony, and Doric customs and the Doric dialect continued to prevail at Byzantium for many centuries. Tacitus (*Ann.* xi. 63) relates in accordance with Strabo, a tradition that the colonists having asked the oracle of Apollo where they should build their new town, were told to look for a spot opposite to the 'land of the blind,' alluding to the previous Calchedonian colonists, who had built their town in an inferior position when they had the option of the

site of Byzantium. Strabo (p. 320, Casaub.), Pliny, and other ancient writers, speak of the abundance of fish in the sea of Byzantium, especially of the Pelamys kind, which, coming down in shoals from the Palus Mæotis, and round by the eastern and southern coast of the Euxine, entered the Bosphorus, whence the harbour of Byzantium was called 'the golden horn,' in consequence of the riches derived from the fishery. (Plin. *Hist. Nat.*, ix. 15.)

The Byzantines salted the fish, which was an article of considerable trade. The harbour of Byzantium became a place of resort for vessels trading with the Euxine, the northern coasts of which already, in the time of Herodotus, supplied with corn, as they do now, Greece and other countries of the Mediterranean.

The name of Byzantium is said to be derived from Byzas, the leader of the Megarian colony: Neptune, it is said, was his father; a parentage which indicates that Byzas hardly belongs to the historical age. The Byzantines and Calchedonians in conjunction founded Mesembria. Another Megarian colony had founded Selymbria, and the Megarians had also a share in the foundation of Heraclea on the Pontus. In the reign of Darius Hystaspes, the Persian satrap Otanes took Calchedon and Byzantium. After the battle of Platæa, Pausanias, at the head of the united Greek forces, took Byzantium, and a fresh colony of mixed Athenians and Lacedæmonians was sent to it. This second colony has given occasion to Justinus and other writers to say that Byzantium was founded by Pausanias. The Lacedæmonians kept possession of Byzantium till Pericles took it from them, but they retook it shortly after. Alcibiades again got possession of it by a stratagem and by holding communication with some persons within the place. (Plutarch, *Alcib.*)

Lyxander recovered it soon after, and it was under the Lacedæmonians when Xenophon, with the remnant of the 10,000, passed through it on his way home, and his men had a serious affray with the Lacedæmonian governor, which was with difficulty settled by the prudence of Xenophon. Thersylulus drove the Lacedæmonians away, 390 B.C., and changed the form of government, which was before aristocratical or rather oligarchical, into a democracy. It appears, however, that there was a class of the original inhabitants of the country who were treated by the Greek Byzantines pretty much as the Helots were treated at Sparta. (Cf. Müller, *History of the Doric Race*, in. ch. 4.)

After the recovery of their liberty, Byzantium seems to have prospered for a time, and it became the head of a sort of confederacy of the neighbouring maritime towns. It also joined Rhodes, Cos, and Chios in the league with King Mausolus against the Athenians, who sent an expedition against Byzantium, which however failed. Some time after, Philip of Macedonia having offended his conquests into Thrace, laid siege to Byzantium. The Byzantines made a bold defence, and Philip's army became distressed for want of provisions and money. Philip relieved his wants by seizing 170 ships and confiscating their cargoes. On a dark night, Philip's soldiers were near surprising the town, when a light shone suddenly from the north, and revealed to the inhabitants their danger. In gratitude for this, the Byzantines built an altar to Diana, and assumed the crescent as the emblem of their city. The crescent is found on several medals of Byzantium, and it is said that the Turks, on their conquest of Constantinople, adopted it for

* The common but incorrect mode of writing the name is Calchedon.

M 2

[Brit. Mus. Silver. 206 gr.]

their own device. Baffled in his attempt, Philip raised the siege and turned his arms against the Chersonesus. Under Alexander the Great and Lysimachus, who, after his death, succeeded to the government of Thrace, Byzantium was obliged to submit to the Macedonians, but it afterwards recovered its municipal independence, which it retained till the time of the Roman emperors. Its maritime commerce was prosperous, but it was exposed on the land side to continual incursions of Thracians, Scythians, and other barbarians, who ravaged its territory, cut down the harvest, and reduced it to great distress. The most troublesome of these incursions was that of the Gauls, who overran Macedonia and Northern Greece about 270 years B.C. The Byzantines, in order to have some respite from them, were obliged to pay heavy sums, from 3000 to 10,000 pieces of gold a year, and at last as much as 80 talents, to save their lands from being ravaged in harvest-time. These and other burthens compelled them to have recourse to extraordinary measures for raising money, one of which was the exacting of a toll from all ships passing through the Bosphorus, which became the cause of the war between Byzantium and Rhodes about 221 B.C. (Böckh on the public Economy of the Athenians, b. iii.) The Gauls at last went over to Asia, and left Byzantium in peace. The Rhodians, a maritime trading people, refused to pay the toll on their ships passing through the Bosphorus, which led to a war with Byzantium, in which Prusias I., king of Bithynia, sided with the Rhodians, and Attalus I., king of Pergamus, took the part of the Byzantines. The latter had the worst of it, and peace was made by the mediation of Cavalus or Cavarus, king of the Gallo-Græci.

Athenæus, Ælian, and other antient compilers, give rather an unfavourable account of Byzantine morals and manners. Idleness and debauchery prevailed, the citizens spent their time in the market-place, or in the numerous public houses of the city, and let their houses and wives to strangers. The sound of a flute put them immediately in a merry mood, but they fled from that of a trumpet, and their general, Leo or Leonidas, in the siege by Philip, had no means of keeping them to watch and defend the walls but by causing the sutlers and canteens to be established along the ramparts. (Athenæus, x. p. 442; Ælian. Hist. iii. 14.) Byzantium was full of foreign and native merchants, sailors, and fishermen, whom the excellent wine sold in the town and supplied by Maronea and other districts seldom permitted to return sober to their ships. A democracy of such jolly carousers could not be expected to be very strict and orderly in its administration, and it is recorded of a Byzantine demagogue that being asked in some particular case what

was the law of the country, he answered, 'Whatever I please. (Sextus Empiricus *adversus Rhetores*, 37; O. Müller, *History of the Doric Race*.) Dion says that the walls of Byzantium were built of massive square stones fastened together with iron bolts, and fitting so well together that the whole wall appeared to be one block. The Byzantines at one time had 500 ships, several of them with rudders at both ends, so as to be able to steer either way without veering or tacking. Tacitus speaks of such vessels being used in the Euxine in his time. (Hist., iii. 46.) As for the extent of old Byzantium previous to the time of Constantine, there is some discrepancy of authorities; but it appears almost certain that it was much larger than has generally been supposed. The common opinion is that its area corresponded to that of the present seraglio and gardens of the sultan; but it appears to have occupied at least 4 of the 14 regions of the subsequent city of Constantinople, namely the 4 most easterly ones, Nos. 1 to 4. (Codinus, *Fragment of Hesychius on the Origin of Constantinople*; and Banduri, *Imperium Orientale*, vol. i. on the antiquities of the same, with the maps of Constantinople in vol. ii.) Dionysius Byzantinus gives it 40 stadia in circumference. The acropolis or citadel stood on the hill where the seraglio now is.

Byzantium allied itself to Rome against Philip II. of Macedonia, as well as against Antiochus and Mithridates. In consequence of its services it retained its liberty as a free town confederate with Rome, and its envoys were treated as foreign ambassadors. Some domestic disputes however occasioned an appeal to Rome from the losing party, and Clodius the tribune carried a decree enjoining the Byzantines to readmit the emigrants. Piso was sent to enforce this decree, but his conduct there appears to have been that of a hostile conqueror rather than of an ally and mediator. (Cicero de *Provincia Consul*.) After Piso's departure the Byzantines resumed their former independence. They were subject to a tribute however, at least under the first emperors, which Claudius remitted for five years, in consideration of their losses during the Thracian war. (Tacitus *Ann.* xii. 62.) In consequence of some fresh domestic broils, however, Vespasian took away their liberties and sent them a governor, and when Apollonius of Tyana remonstrated with the emperor on the subject, Vespasian replied that the Byzantines had forgotten how to be free. In the civil war between Severus and Pescennius Niger, the Byzantines took the part of the latter. After Niger's death Severus besieged the town, which the inhabitants defended for three years with the courage of despair. At last famine obliged them to surrender, and Severus treated them with his characteristic inhumanity. The armed men and the chief citizens were put to death, the walls were razed, and the remaining inhabitants were placed under the jurisdiction of Perinthus. Severus however relented afterwards, and, visiting Byzantium, took pains to embellish the town; he built magnificent baths, porticoes round the Hippodrome and other buildings, and gave it the name of Augusta Antonina, in honour of his son Antoninus Bassianus. [CARACALLA]. The Byzantines having rebuilt their walls, and recovered their prosperity, had next the misfortune of somehow displeasing Gallienus, a worse man than Severus, who entered the town under a promise of amnesty, and had most of the inhabitants massacred. Trebellius Pollio says that in his time there were no old families in Byzantium, except those who had left the town before Gallienus entered it. The town however was restored, and it repelled an irruption of the Goths, who had entered the Bosphorus under Claudius II. After the defeat of Licinius by Constantine, Byzantium surrendered to the latter, who was so struck with its situation that he determined to build a new city by the side of old Byzantium, which he called Nea Roma, and which he chose afterwards for the capital of the empire. In May A.D. 330, the new town, which had been commenced only three years before, was dedicated to the Virgin Mary, and the feasts lasted 40 days. [CONSTANTINOPLE.]

C. This letter is derived from the Latin alphabet, in which it first appears. But even in that alphabet it originally possessed the power of *g*, as pronounced in *goose*. Thus the Roman proper names *Canus* and *Cneius*, which retained this sound, are correctly represented in the Greek character by *Caïos* and *Gnaïos*; and the Dutilian inscription presents *macestratus*, *leciones*, *pucnando*, *ecfoctoni*, in the place of the modern forms, *magistratus*, *legiones*, *pugnando*, *ecfoctunt*. Indeed the poet Ausonius expressly states that *C* once performed the duty of *G*: *Gammæ vices, functa prius C*. (See also Festus, *vv. Prodigia, Orcum*.) This medial pronunciation corresponds with the power of the letters which occupy the third place in the Greek and Hebrew alphabets, *gamma* and *gimel*; and the identity of the letters is confirmed by the similarity of the forms. [ALPHABET, p. 384, col. 2.]

The letter *c* in English is pronounced as *s* before *i*, *e*, and *h* before *a*, *o*, *u*. This variety in the power of the letter seems difficult to account for; but it may be observed that *i*, *e*, belong to one end of the vowel series, *a*, *o*, *u*, to the other [ALPHABET, p. 379, col. 2]; and it is further to be noticed that the vowels *i* and *e*, when they precede vowels, have a power approaching to that of *y* in *youth*, and that if in addition to this, *c* or *g* precede, there often results a sound like that at the beginning of the words *church* and *John*, and this sound of *ch* is not very different from a sibilant. The vowels *i* and *e* produce a similar sound when preceded by a *d* or *t*, and followed as before by a vowel. Thus from *ration* the Italians have obtained *ragione*; and from *radio*, *raggio*; from *Diana* the rustics of Italy made *Jana*. These considerations are perhaps supported by the employment of the little mark called *cedilla* in the French language, which is used to denote that *c* is to be pronounced as an *s* even before the other vowels, as *ça*; for the mark appears to have been originally an *i*. The connexion of the sounds *h* and *s* will be again spoken of.

The letter *c*, when pronounced as in *cat*, belongs to the order of guttural or throat letters, and among these it is distinguished by that character which grammarians have denoted by the Latin word *tenuis*, 'thin.' The correct distinction of the letters called *tenues*, as opposed to those which bear the name of *medials*, is perhaps this, that in the pronunciation of the *tenues* *p*, *k*, *t*, the organs employed in articulation have only a small portion of their surfaces brought into contact, and that but for a short time; while in the articulation of *b*, *g*, *d*, the surface in contact is more extensive, and the effort less rapid.

The letter *c* is liable to the following interchanges:— In the derivation of French words from the Latin, *c* or *a* is changed into *cha* or *che*; ex., the Lat. *camera*, ulted chamber, *castus*, chaste, &c., *carus*, dear, *cadere*, *casa*, cottage, appear in French under the forms, *re*, *chaste*, &c., *cher*, *cheoir*, *chez*, &c. In this way English language has derived *channel*, *chivalry*, *char-hattels*, through the French from the Latin *canalis*, *lus*, *caro* (*carnis*), *capitalia*; and at the same time uses the words *canal*, *cavalry*, or *cavalcade*, *carnival*, &c., derived from the same roots, but by a different route. The *patois* prevailing in the N.E. of France, the sound *ch* still remains in these words, *chemin* being pronounced *kemin*, *chat* as *cat*.

The change of *c* into *ch* prepares us in some measure that of *c* into *s*, as Lat. *facimus*, we do, Fr. *faisons*; *placere*, *licere*, Fr. *plaisir*, *loisir*, Eng. *pleasure*, *ure*. This interchange of *c* and *s* is strongly exemplified in the comparison of the western languages of Europe those lying towards the east. Thus we have in *n*, *canis*, dog; *conca*, shell; *centum*, hundred; *decem*, ten; *cannabis*, hemp; in Greek, *kuon* (*κυν*), *konche* (*κογχη*), *hekaton* (*ἑκατον*), *deka* (*δεκα*), *kannabis* (*κανναβις*); in Sanscrit, *svan*, *sanca*, *sata*, *dasan*, *sana*; and in Russian, forms for *calamus*, *cor*, *centum*, *canis*, are *soloma*, *see*, *solt*, *sobaka*. It should be stated, however, that in the Sanscrit alphabet, which is thus convertible with that of the west, is a letter of a peculiar character, and is denoted by a distinct symbol. Even Herodotus has observed (ix. 20) that the commander of the Persian cavalry, *Atios*, was called by the Greeks *Makistios*, and the

same interchange may occasionally be seen in the Teutonic languages, as in the German *faust* and *fechten*, Eng. *fast* and *fight*, words as certainly related as the Latin *pugnare* and *pugnus*. The pronunciation of the Latin *c* as an *s* in such words as *Cicero*, *Cassar*, is proved to be incorrect by the Greek equivalents *Kikeron* (*Κικέρων*), *Kaisar* (*Καίσαρ*), and no less so by the co-existence of such forms as *acer*, *acris*; and it would be trifling to defend the pronunciation by the accidental identity in form of the Roman *c* and one of the many symbols for the Greek sigma. [HABET, p. 383, columns 33 and 36.]

3. *C* initial of the Latin language corresponds to *h* in the German. Compare *collum*, *hals*, neck; *celare*, *hehlen*, hide; *cutis*, *haut*, hide; *cannabis*, *hanf*, hemp; *canis*, *hund*, bound; *cornu*, *horn*, horn; *calamus*, *halim*, stalk; *caput*, *haupt*, head; *cor* (*cord*), *herz*, heart; *crates*, *horle*, hurdle. Traces of the same change are visible within the Latin itself, as *traho*, *traxi* (*trac-si*); *veho*, *vexi* (*vec-si*); and the town of Apulia, called by Strabo *Kerdonia*, is called by Roman writers *Herdonia*. So the Greeks had *oococ* (*οοκος*), an eye, while the Romans preferred *oculus*.

4. *C* is convertible with *v* and *u*. This may be seen in the related forms *Dacus*, *Davus*; *focus*, *foveo*; *nix*, *nivis*; *convinco*, *convici*; *lucus*, *lupo*; *vivo*, *vixi*; *struo*, *struxi*. Thus too the English 'quick' (the original meaning of which is seen in the phrases 'the quick and the dead,' 'the quick of the nail,') is identical with the Latin *vivus*; and we have another remarkable example in the derivation of our words *eleven* and *twelve* from the Latin *under-ten*, *duodecim*. [See L.]

5. *C* into *g*. The change already mentioned of the power of the Roman symbol *C* is a sufficient proof of this. We may add *eager*, *meagre*, derived through the French *aigre*, *maigre*, from the Latin *acer*, *macer*. The old meaning of *eager* in Shakspeare is sharp, sour, as *eager milk*; and indeed the word appears again in *vinegar*, *vinagre*. So too *ateagle*, blind, must have come from a Latin word, *aboculus*. The same change appears in the Teutonic. To the Latin *oculus* corresponds the German *auge*; to *duc-o*, *zog* and *zug*; while the Latin *lacr-uma*, or Greek *dukr-uon*, has in Gothic the form *tagr*, a tear.

6. The interchange of *c* with *p* is most remarkable in the Greek and Latin languages, the former commonly preferring the labial. Gr. *pepo*, Lat. *coquo*, cook; Gr. *leipo*, Lat. *linguo*, leave; Gr. *pipio* (or rather *pi-pei-o*), Lat. *cad o*, fall, &c. The same interchange appears within Italy itself: the pigeon in Rome was called *columba*, the pigeon out of Rome, that is the wild pigeon, was called *polumbia*; so *proximus*, nearest, has supplanted *propinquus*, from *prope*, near. The Latin word *quicquid* was pronounced by an Oscan as *pitpit*, and Augustus, we are told by Suetonius (Octav. 88), cashered an officer for his ignorance in spelling *ipse* with an *x*. This convertibility of the *tenues* extends to the letter *t*. Thus we find *scapula* and *spatula* both conveying the notion of a blade. The Greek *tetartos*, fourth, *tis*, who, *te*, and, appear in Latin as *quartus*, *quis*, *que*. The old name of the rock of Gibraltar assumes the various forms, *Calpe*, *Carpe*, *Carte*, *Tarte*. And in English we have *nut*, from Lat. *nuc*, and, on the other hand, *cork* from *cor-cer*.

7. Latin words beginning with *cu* have often lost the guttural. Thus *ubi* occupies the place of *cubi*, an old dative of the relative (compare *sicubi*, *alicubi*, &c.); *uter* of *cuter* (compare the Greek *koteros*), *umquam* of *cumquam* (compare together *quis*, *cum*, *quasquam*). This variety appears in our own tongue, where *which*, formerly *whilk*, was once written *quichill*.

8. *C* often disappears before *l* and *n*. This naturally arises from the difficulty of pronunciation, as in *knee*, Lat. *genu*; *know*, Lat. *gno-sco*; thus from the old Frank name *Clodovic* are derived *Glovie*, *Louis*, *Ludovicus*, *Ludwig*, *Lovick*.

9. In the derivation of Italian and French words from the Latin, *c* disappears before a *t*, the preceding vowel being

* In some of the provinces of England 'wick' is used in the sense of quick. A thing that is alive is said to be 'wick.'

† In our own language we have *rock* (Fr. *roche*), from the Latin *rupes*, *scum* (Fr. *rocme*) from *spume*.

com
dit; as *Lat. dactus*, said, *It. ditto*, *Fr.*
cuil, cooked, *It. cotto* (whence *terra cotta*).
Fr. cuil, twice baked). It also disappears
at times, as in *Lat. sacramentum*, oath, *Fr.*
ment; *It. manto*, a coat, *Fr. manteau*. Lastly, the same
fate awaits it when flanked on either side by vowels: com-
pare the *Latin* *mens, forus, foens, paucum, vices, apicula,*
corbicula, oculis, nocere, &c., with the *French* *lieu, feu,*
feu, peu, fois, oseille, corbeille; oeil, naitre, &c.

C is the Latin symbol for a hundred. Whether it is so
used as being the first letter of *centum*, a hundred,
doubted. [NUMERALS.]

C (in music), the first note of the diatonic scale, answer-
ing to *Do* of the Italians, and the *ut* of the French. It
gives a name to the natural major mode; i.e. that mode or
key, in which no sharps or flats are employed. It is also
the mark of common, or four-crotch, time; and, when a
bar is perpendicularly drawn through it, *alla-breve* time is
indicated. (ALLA BREVE). This letter is likewise used as
the abbreviation of *Counter-tenor*, or *Contralto*.

CAAMA. [ANTELOPE, Species 62. See also Species
63.]

CABAL is often applied to a set of persons too insignifi-
cant in point of number to form a party who endeavour
to effect their purposes by underhand means. The ministers
of Charles II., Clifford, Ashley, Buckingham, Arlington,
and Lauderdale, the initials of whose names happen to
form the word cabal, were appropriately called the 'Cabal
Ministry.' The character of these ministers is given by Hume
in his 'History of England,' reign Charles II. The word
'cabal' appears to come from the French *cabale*, a term
employed to express a number of persons acting in concert;
and it is generally understood in a bad sense. (Richelet.)
We are not aware that it was used in our language before
the time of Dryden.

CABANIS, PIERRE JEAN GEORGE, a distin-
guished physician and philosopher, the son of Jean Baptiste
Cabanis, an able agriculturist, was born at Conac in 1757.
His natural disposition appears to have been somewhat vio-
lent, and the earlier period of his youth was passed in con-
tinual struggles against the severity of the treatment which
he seems to have received both from his father and his
teachers. During a short interval, in which he was under
the care of a kind and judicious instructor, he indicated a
decided taste for classical literature; but being soon removed
from a teacher who saw and endeavoured to develop his
latent talents, and being again subjected to harshness, he
lapsed into such a state of idleness and obstinacy, that at
the age of fourteen, his father in absolute despair sent him
alone to Paris, where, feeling he had no sort of influence
over him, he abandoned him to his own course. The mo-
ment he felt himself free, this youth, hitherto so indolent
and intractable, became a diligent student, and for the
space of two years devoted himself with an intensity which
has been rarely exceeded to the study not only of the Greek,
Latin, and French classics, but also of the works of the meta-
physical writers both of England and France. His love of
poetry was ardent, and he soon acquired no inconsiderable
celebrity for some poetical pieces of his own; but seeing
nothing cheering in the prospect of the pursuit of literature as
a profession, he chose the study of medicine chiefly, as he
himself states, on account of the varied sciences to which
it obliged him to direct his attention. Under the guidance
of a friend, an able physician, he applied himself for six
years to the study of medicine with so much intensity that
his health began to fail him, and being on this account
obliged to leave Paris, he went to reside at Autoul, where
he became acquainted with the widow of Helvetius. This
acquaintance determined the character of his future life.
At the house of this lady, who in a manner adopted him as
her son, he became intimate with the most celebrated men of
that age, Turgot, D'Holbach, Franklin, Jefferson, Condillac,
and Thomas. Here too he lived familiarly for many years
with Diderot and D'Alembert, and occasionally saw Vol-
taire. He appears to have formed a strong attachment to
Mirabeau, for which he was exposed to no little obloquy;
he was the chosen friend of Condorcet, and he had the gra-
tification of being able to sooth the last moments of both
these remarkable men. He married Charlotte Gouchy,
sister of General Gouchy and of Madame Condorcet, with
whom he lived happily until his death, which happened
somewhat suddenly on the 5th of May, 1808, in the 52nd
year of his age. He had borne no inconsiderable part in the

Revolution; was one of the Council of
Health, and afterwards member of the Senate. He
the author of several works of great celebrity in his day,
but that which has given to his name a permanent distinction
is his treatise on the relations between the physical and
moral nature of man. This work, *Rapports du*
Physique et du Moral de l'Homme, is partly metaphysical
and partly physico-logical, and displays no ordinary power of
observation and analysis. It is remarkable too as being the
first attempt to treat, in a systematic form, the interesting
but difficult subject which it investigates. This work may
still be read with interest and instruction by the physician,
the metaphysician, and the practical educator.

CABASSOU, or KABASSOU, Lo, Sec-
tion II.

CABBAGE. There are several species of a genus
brassica, or cabbage, which comprehend the *turnip*, the
rupe, the *cole*, and the common culinary cabbage, or *brassica*
oleracea. The innumerable varieties arise from dif-
ference of soil and cultivation; and as all the cabbage tree
form hybrids, new varieties are continually produced. This
is effected by the bees, when different sorts are in flower
at the same time. The pollen adheres to their body as they
seek honey in the flowers, and being deposited on the pistils
of other sorts, impregnates the germs. Hence only a
variety of cabbage should be in flower at the same time, in
any garden or field, when we wish to keep the sort undistur-
bated; particularly if some sorts have expanded leaves,
and others close heads. It is thus only that the excellent
small miniature cabbage, which grows on the stem of the
Brussels sprout, can be kept in perfection. The different
sorts of cabbages most prized for the garden are chiefly
divided into the close-heading and the spreading. Of the
first, the York and the Savoy are the most common; of the
latter, the cole-worts and Scotch kale.

In order to have a regular succession of cabbages the seed
should be sown at different times, from the beginning of
spring to the autumn. The early sown will run to seed the
same year; the later sown will increase more, produce larger
and firmer heads, and will not go to seed till the next.
Some sorts, it is said, will continue to produce leaves
several years, if they are regularly taken off, and if the
stem is prevented from shooting by cutting it down as soon
as it begins to appear. Thus a perennial cabbage-tree is
produced, which yields abundance of food for sheep and
cattle.

Cabbage plants are generally raised first in a seed-bed
when they are intended for early produce they are sown
before winter, and protected by shelter, or under glass
frames. In this manner strong plants may be had early
in spring, which planted out in April will produce fine
cabbages by July or August. Those which are raised on a
large scale are generally sown in March, and planted where
they are to remain in June or July. When they have been
pricked out from the seed-bed very young, and allowed
to get to a good size in a piece of ground prepared for the
purpose before being finally transplanted in the field, the
success is more certain, and it will well repay the additional
trouble. These come to perfection in autumn, and may be
taken off the ground as they are wanted. Some kinds are
so hardy that they will bear the severest frosts, and remain
covered with snow for a considerable time without damage.
Such are the green curly-leaved cabbages, or Scotch kale,
which form no close head, but consist of spreading leaves.
The great portion of nutritive matter in the leaves and
stems of cabbages has made them an important object of
cultivation wherever much cattle is kept, and where the
land is favourable to their growth.

The cultivation of cabbages is the same in the field as
in the garden, except that on a large scale less attention is
paid to each plant, and the spade is superseded by the
plough, and other instruments. A good and rather stiff
loam is best adapted to cabbages. They require a consider-
able portion of manure if the land is not naturally rich, or
if they are cultivated as a part of a regular rotation. There
is no vegetable which produces so large a portion of food
for cattle on the same space as the cabbage, provided the
soil suits its growth. Though it impoverishes the ground,
this should not prevent its being extensively cultivated,
provided the nourishment it produces compensates for the
additional manure required. The great advantage in the
cultivation of the cabbage is, that a great portion of its
substance is restored to the ground in all well-regulated

establishments, in the shape of the dung and of the cattle fed upon them. It is asserted by experienced agriculturists that in this respect it is superior to the common turnip. The cultivation of the cabbage on a large scale, by means so general on the soils well adapted for it, is what is wished. This is probably owing to the trouble of transplanting, and the occasional failure of the plants in very dry weather. But the trouble and expense may be greatly diminished by attention and method. The plants may be raised in such abundance, by having a regular garden for the purpose, that they may be transplanted at various times, and the plants placed so thick as to allow for failures, whilst those which are superfluous may be sold out. The cause of failure is generally in the careless manner of planting. Holes are usually made in the ground with some blunt instrument, the plants are put in without its being noticed whether the roots are doubled up or straight, when the earth is pressed close to the roots, or distances are not between them and the soil, in which case they cannot take root properly. The ground having been well prepared, and being in good heart and tilth, the plough should open a deep and narrow furrow. The plants having been carefully taken up without breaking the fibres of the root, the tops should be cut off to about six inches from the crown, women and children should then go along the furrow with baskets in which the plants are carefully laid, and place them, at the distance of eighteen inches or two feet from each other, against the earth which has been just turned over by the plough, so that the bottom of the roots shall lie along the newly-made ridge, and the crown of the plant be on a level with the surface of the ground; a slight push will make it adhere to the fresh soil. If some rich mould is mixed with drainings of the dung-hill or ditch water to the consistency of soft mud, and the root of each plant is dipped in a pail of this mixture immediately before planting, the plants will seldom fail. The plough in returning covers all these roots with the earth of the next furrow; and a man follows and presses his foot obliquely at the furrow slice at the place where the head of the plant appears. The plough then takes two shallower and narrower furrows, or leaves a space of two feet between the last-made furrow, and forms another in which plants are again placed and covered up as before. The rows will thus be three feet wide. If the cabbages are of a large sort every alternate plant may afterwards be cut out, either as soon as they are fairly rooted, or when they have acquired a moderate size; in which case they will afford excellent food for cows and pigs, although not sufficient to stall cattle upon. The repeated use of the plough and horse-hoe between the rows is necessary for the growth of the cabbages, as well as highly useful to clean the land. By this mode of cultivation much labour is saved, the risk of the failure of the plants is greatly diminished, and if the ground has been well prepared and sufficiently manured, an astonishing weight of solid food for cattle is obtained. The best sort to plant in the field is the large red, or the Scotch drum-head cabbage. Should the ground be of great fertility, and at the same time compact, the large Strasburg cabbage, which grows to the weight of 60 and even 80 lbs., will produce an enormous weight of food. This cabbage is common in Germany.

When given to cattle or sheep, cabbages should be sliced in the same manner as turnips or beet-root. When milch cows are fed with them, all the decayed leaves should be carefully taken off and given to store cattle or pigs; for these are the chief cause of the bad taste which the milk and butter acquire from this food. [BUTTER.] For bullocks cabbages and cake are excellent food, and increase their flesh rapidly. For sheep they should be sliced and given to them in troughs in the field where the cabbages grow, or on grass-land which requires to be manured. In England the sorts which have a close head are preferred; but where labour is abundant and forage scarce, as in France, the branching sorts are thought more profitable, because the leaves may be taken off repeatedly and will grow again. The thousand-headed cabbage, and the large cabbage of Poitou, as well as the tall cabbage, called *chou cavalier*, which grows with a stem six feet high, and gives large broad leaves without any close head, are greatly preferred in France to the sorts which bear close heads.

Cabbages are subject to a peculiar disease when repeatedly planted in the same ground: the bottom of the

stem enlarges, and the plant becomes. This disease is called *clubbing*, and is occasioned by an insect, which deposits its eggs in the substance of the stem where it joins the root: the organization of the plant is destroyed, and the cabbages never come to perfection. The only remedy for this disease is to change the cultivation, and for a time to plant no cabbages on the ground, which produces clubbed plants, but to trench it up well, and expose it to the winter's frost in ridges: quick-lime should be put on it, but no manure; and other vegetables of a different class should be sown for two or three years. After this it may be considered as purified, and cabbages may safely be planted there again. In the fields, where cabbages do not return so frequently on the same ground, this disease is seldom found. The depredations of caterpillars and slugs are sometimes very great; the only means of prevention is to pick them off as soon as they appear: ducks and fowls in this case are excellent helps, the former especially, for clearing the ground of slugs.

In Germany there is an immense consumption of the large white cabbage in the form of the national mess, called *saur kraut*. This is prepared in the following manner:—the cabbages are sliced thin by hand, or by a machine like a turnip-slicer, of the same kind as that by which French beans are sliced in Holland. [Bacon, p. 83.] The bottom of a cask, of which the head has been taken out, is covered with salt, and a layer of thin-sliced cabbage six inches thick is laid over it; on this a quantity of salt is spread, and another layer of cabbage mixed with some juniper-berries and whole pepper; and thus salt and cabbage alternately until the cask is filled. A round board is then put into the cask so as nearly to fit it, and on this a heavy weight of stone or metal is laid. As the cabbage ferments and sinks, the cask is filled up with fresh salt and cabbage. After some time the expressed juice is poured off, some water with salt dissolved in it is poured over, and changed until it ceases to rise with a scum and fetid smell; the cabbage is then in a fit state to be kept. A cloth is laid over it, and over this the round board and weights. When any portion is taken out for use, a sufficient portion of brine is allowed to remain over the mass to exclude the air; and the cloth, board, and weights are replaced as long as any cabbage remains. This *saur kraut*, when washed with soft water and stewed with bacon or salted meat, is a very wholesome dish, and much relished by those who have been early accustomed to it. In long voyages it has been found to be an admirable preservative against the sea-scurvy.

CABBAGE PALM. [ARECA.]

CABBALA. 'The Jewish Cabbala,' says Dr. Henry More in the preface to his 'Conjectura Cabbalistica,' is conceived to be a traditional doctrine or exposition of the Pentateuch, which Moses received from the mouth of God while he was on the mount with him. And this sense, or interpretation, of the law or Pentateuch, as it is a doctrine received by Moses first, and then from him by Joshua, and from Joshua by the seventy elders, and so on, was called *Cabbala* from קַבַּל, *kibbel*, to receive. But, as it was deli-

vered as well as received, it was called *Masora*, which signifies a *Tradition*; though this latter more properly respects that critical and grammatical skill of the learned among the Jews, and therefore was profitable for the explaining the literal sense, as well as that more mysterious meaning of the text where it was intended. In a wider sense, however, the Cabbala is used for the whole secret or esoteric philosophy of the Jewish doctors—a subject of great extent and intricacy, upon which voluminous works have been produced both by Rabbinical and Christian writers. The most celebrated collection of the Rabbinical writings on the Cabbala is the work entitled '*Cabbala Denudata, sive Doctrina Hebræorum Transcendentalis*,' &c., 3 vols. 4to. Sulzbach, 1677, and Frankfurt, 1664. The editor of this work, which is a very rare book, the third volume in particular, is believed to be Christianus Knorrus à Rosenroth. Lists of the Rabbinical treatises on the Cabbala may be found in Wolf's '*Bibliotheca Hebræa*,' and in the '*Bibliotheca Magna Rabbinica*' of Bartoloccius and Imbonatus. Of the Christian writers on the Cabbala, the most famous are Picus of Mirandola, the younger Van Helmont, and his friend Dr. Henry More, the learned and eloquent English Platonist. Dr. More, under the title of '*Conjectura Cabbalistica*,' published what he calls '*A conjectural way of interpreting the mind of Moses in the*

three first chapters of Genesis, according to a threefold Cabala, viz.: literal, philosophical, mystical, or divinely moral.' This work, which, with the defences, appendices, &c., in the edition of 1713, fills about 250 folio pages, is a very remarkable performance. So highly does the pious writer estimate the secret philosophy which he thinks may be extracted from the Mosiac records, and so essential does he deem it to the right understanding of scripture, that in his dedication to Dr. Cudworth, he does not hesitate to affirm that if the atheist could have fully granted to him 'that there is no knowledge of God but what Moses has text set on foot in the world, or what is traditional, he cannot but think that religion in this dress is so empty, exceptionable, and contemptible, that it is but just, with as many as are not mere fools, to look upon it as some melancholic conceit, or cunning fiction, brought into the world to awe the simple sort, but behind the hangings to be freely laughed at and derided by those that are more wise, and that it were an easy thing in a short time to raze the memory of it out of the minds of men, it having so little root in the human faculties.' There is a valuable article on the Cabala, by the Abbé Malet, in the great French 'Encyclopédie.' A short popular account of this philosophy is given by the Marquis Le Gendre in the 7th chapter of the third book of his *Traité de l'Opinion*. The celebrated work of the Abbé de Mars, entitled 'Le Comte de Gabals,' from which Pope avows that he took the machinery of Sylphs and Gnomes in his 'Rape of the Lock,' is a satire upon the mystical absurdities of the Jewish Cabala. Bayle has noticed that the substance of this work is contained in the first two of ten letters attributed to the charlatan Joseph Francis Borri, and published at Geneva in 1681, under the title of his 'Chiave del Gabinetto' (Key of the Cabinet) (Art. Borri, note G.) Although the letters in question are dated at Copenhagen in 1666, there can be little doubt that they were stolen from the work of the Abbé de Villars, which was first printed in 1670.

CABELLO. [PUERTO CABELLO.]

CABES, GULF OF, the Syrtis Minor of the ancients, lies between the W. coast of the regency of Tripoli and the E. coast of that of Tunis. It takes its name from the town of Cabes or Ghabis, situated at the bottom of the gulf, and near the border of the two states. The fine island of Gerbi, with 30,000 inh., is in the E. part of the Gulf of Cabes on the Tripoli coast though dependent on Tunis, and the town and port of Sfax in the Tunisian mainland is on the opposite or N.W. coast. The Gulf of Cabes is bounded to the N. by the Cape Capouda and the Kerkeni islands or rocks, which divide it from the Gulf of Hammamet, which extends northwards towards Cape Bon.

CABIÁI. [CAPYBARA.]

CABIN, a term in naval architecture, applied to those portions of a ship allotted to the various officers. In large vessels the admiral's and captain's cabins extend across the ship near her stern, and they are usually divided into two, termed the *fore* and *after* cabins; the latter are considered more strictly private, while the former are used for dinner, for the reception of strangers, and other purposes. Those belonging to the junior commissioned and warrant officers are ranged along the side of the ship, having an area of from five to six feet in width, and from six to seven feet in length.

In frigates the captain's cabin is on the main deck, and the gun-room, or after-part of the lower deck, is given to the officers; but in two-decked line-of-battle ships, the captain takes the cabin under the poop, and the officers the great cabin on the upper gun-deck, which is called the ward room, and along the sides of which is a row of private cabins (each containing a port, and therefore a gun), while the central space is left undivided for a mess-place. In three-deckers, this large apartment is appropriated to the admiral, and the officers take the corresponding one on the middle gun-deck. The partitions by which all these cabins are enclosed are called *bulk-heads*, and are composed of light panelled frames, which are instantly removable when the decks are ordered to be cleared for action.

CABINET, a word which is extensively employed in the French language, but has a much more limited signification in this country. In France, an apartment in which men of business transact their private affairs and barristers receive their clients is called a cabinet. Hence the application of the word to the council chosen by kings to advise with them on the course of public affairs and to direct the higher

branches of the administration. The members of the executive government in England who are responsible for public measures are, as a body, termed the Cabinet, and as individuals, Members of the Cabinet.

CABIRI (Καβίριοι), ancient Palæstines, belonging to a system of elementary religion in the later ages of Greece, was connected with the notion of mysterious rites in the island of Samothrace. According to Strabo (p. 472), who quotes Stesimbrotus, they derived their name from Mount Cabeirus in Berezynthia. They were apparently the same as the Corybantes, &c. (Strabo, p. 466, 472; *Schol. on Aristoph. Pac.* 277), and their worship was most cultivated in Samothrace, Lemnos, Imbros, and certain towns of Troas. (Strabo, p. 473.) Their names were mystical, and are given by Mnaseas. (*Schol. Apoll. Rh.* i. 917.) Camilus, Cumilus or Cadmilus, was the son of Hephæstus and Cabeira, and his children were the three Cabeiri, from whom came the nymphs Cabeirades. (Acusilaus, *ap. Strab.*, p. 472.) Camilus is stated to have been the same as Hermes, and the three Cabeiri mentioned by Mnaseas, Axieros, Axiocore, and Axiocorsus, are said to correspond to Ceres, Proserpine and Pluto respectively. It seems more probable, however, that Camilus represented the generative principle (Herod. ii. 51.) and that the three Cabeiri were personifications of Love, the male and the female, the first part of each name being the epithet *ἀξιος* (worthy) which is very frequently applied to gods, and the remaining parts, Eros, Kergos and Kersa, having the significations which we have assigned to them. (κίρη, γάρμος. Hesych.) The reader who is desirous of investigating this ancient religion may consult *Crouzer's Symbolik* (ii. p. 318.); Müller's *Orchom.* (p. 450.); Welcker's *Trilogie*; Lobeck's *Aglaoph.* (lib. iii. c. 6), and Schelling's *Treatise on the Samothracian Mysteries*. The images of the Cabiri were pygmy statues, of which there are specimens among the terra-cottas of the British Museum (Combe, no. 42). As the son of Vulcan, Cabeirus or Cadmilus is represented with a hammer in his hand. (Winckelmann, ii. p. 507.)

CABLE. [ROPE.]

CABLE, CHAIN. [CHAIN CABLE.]

CABOT, SEBASTIAN. The accounts of this great navigator have till recently been clouded by the greatest obscurity. A Memoir of Cabot, published in London in 1831, has at last put the facts of his life in a clearer light, and removed much of the uncertainty. After a careful consideration of the arguments in this memoir, we have adopted nearly all its conclusions.

Sebastian Cabot was the son of John Cabot or Cabotto, a native of Venice, who resided occasionally in England, and of whom little more is known than that he was a wealthy, intelligent merchant, and fond of maritime discovery. Sebastian was born at Bristol about 1477, and was early instructed in geography, navigation, and mathematics. When only 19 years of age, he was included with his two brothers in a patent, dated 5th of March, 1496, granted by Henry VII. to John Cabot his father, for the discovery and conquest of unknown lands. About a year after the date of the patent, Sebastian Cabot sailed (apparently with his father) in a ship equipped at Bristol, named the *Matthew*, and on the 24th of June he first saw North America, probably the coast of Labrador, about lat. 56°. It has generally been stated that this first-discovered land was Newfoundland, and that it was named by Cabot *Prima Vista*; but it appears that the cause of the error was a mistranslation by Hakluyt of a document in Latin appended to a map of America drawn by Cabot himself. The description given in that document cannot possibly refer to Newfoundland, but may apply very well to the coast of Labrador. We have no account of this voyage further than the discovery itself, but it appears probable that Cabot returned to England immediately: an opinion which receives some support from an entry in the privy purse expenses of Henry VII.—10th August 1497 To hym that found the new Isle '10.' This is still further confirmed by the recent discovery of an original patent of 3rd of February, 1498, granting to John Cabotto permission to take six ships in any haven of the realm, of the burden of 200 tons and under, 'to convey and lede to the Loude and Isles of late founde by the seid John in oure name and by our commaundement,' &c. The date of this last patent and its general purport have been long known, but it has been usually supposed to be simply intended to further the object of the first patent, in consequence of difficulties experienced

in fitting out ships; and an error in date has been suspected in order to make it tally with the supposition. It is difficult to assign to each of the Cabots (a father and three sons) his exact part in these discoveries, but Sebastian seems always to have been considered the most scientific navigator of the family. Another voyage was made by Cabot, according to the terms of his patent, but we have no details as to its result; and a third voyage appears to have been made to the Gulf of Mexico in 1499. About this time it is supposed that John Cabot died, but there is no record of his death, nor is anything whatever known of Sebastian Cabot for the next twelve years. Soon after the death of Henry VII. Cabot was sent for by Ferdinand king of Spain, in which country he arrived in September, 1512, and immediately received the title of Captain, with a liberal salary. It appears from Spanish authorities, that Cabot was disgusted with the want of consideration shown him in England. No specific duties appear to have been at first assigned to Cabot in Spain; but we find him in 1515 connected with a general revision of maps and charts, and holding the dignified station of member of the council of the Indies. He was also appointed to conduct an important expedition for making new discoveries towards the west; but the death of Ferdinand, in the beginning of 1516, prevented the accomplishment of the plan. The new king of Spain, Charles V., was occupied elsewhere, and did not reach Spain for some time, during which the court was a scene of shameless intrigue. Fonseca, the enemy of Columbus, was in authority, and the slights he and his creatures put upon Cabot caused his return to England. In 1517 he was employed by Henry VIII., in connexion with Sir Thomas Perte, to make another attempt at a north-west passage. It appears that on this voyage he reached lat. 67°, and it must have been on this occasion that he entered Hudson's Bay, and gave English names to sundry places therein. But of this, like all the rest of Cabot's discoveries, no details have been preserved, and even the whole voyage has been referred to the south instead of the north. It is only known that the malice or timidity of Sir Thomas Perte, and the mutinous conduct of his crew, compelled him to return. After this voyage Cabot again visited Spain, where he was named by Charles V. Pilot Major of the kingdom, and intrusted with the duty of critically examining all projects of voyages of discovery. At this time the views of adventurers were chiefly directed to the south, and the Molucca Islands were pointed out as a valuable field for enterprise. Portugal having earnestly represented that the limits assigned to her by the pope in his division of the New World would include the Moluccas, it was resolved that a solemn conference should take place, in which all parties should state their claims, and experienced men should attend for the purpose of reference. Cabot is at the head of this list, in which we also find Ferdinand Columbus, son of the great Columbus. The conference was held at Badajoz, in April, 1524, and by the end of May sentence was pronounced that the Moluccas were within the Spanish division of the world. The Portuguese retired in disgust, talking of preparing an expedition to destroy any Spanish or other vessel which should venture to trade within the disputed territory. Immediately after the decision, a company was formed at Seville to prosecute the trade to the Moluccas, and Cabot was solicited to take the command. By an unfortunate selection, the persons who were put in command immediately under Cabot were personally hostile to him. The expedition sailed in April, 1526, and proceeded to cross the Atlantic. On the Brazilian coast a daring mutiny, excited by his officers, compelled him to resort to the extremity of putting on shore the three ringleaders, who were actually the persons named to succeed him in command in case of his death. Cabot explored the river La Plata and some of its tributaries, erected forts in the most favourable positions, and endeavoured to colonize the country. He dispatched persons to Spain to solicit the permission of the Emperor Charles, and a supply of ammunition, provisions, &c.; and as the merchants declined to co-operate in the new undertaking, Charles took the whole expense upon himself.

About 1527 Diego Garcia, commander of a rival expedition, arrived in the Plata, ascended the Parana, and had an interview with Cabot. Garcia claimed the discovery of the Plata river as being under orders from Charles V.; and Cabot, who would not struggle for a doubtful right, descended the river with him. Garcia soon after quitted the

country, but left behind him some of his followers, who were guilty of acts which roused the fierce resentment of the Guarani, but in which it is expressly declared by Herrera that Cabot took no part. The vengeance of the natives knew no distinctions; the whole nation burst with fury on the feeble colony, and Cabot was compelled to put to sea. He returned to Spain in 1531, where he resumed his old office, and is known to have made several voyages. In 1548 he resolved to return to his native country.

Edward VI. was then on the throne of England, and being very solicitous about maritime affairs, he appears to have conversed with Cabot, and to have received from him some explanation about the variation of the compass, first noticed, or at least first particularly attended to, by Sebastian Cabot. In the beginning of 1549 Edward granted him a pension of 250 marks per annum (166*l.* 13*s.* 4*d.*). Cabot remained high in the king's favour, and was consulted in all affairs relating to trade and navigation. The advice and influence of Cabot in directing an expedition to the north, opened to England the valuable trade with Russia: he was made governor of the company of merchant adventurers by whom the expedition was fitted out; and the instructions delivered by him to the commander, Sir Hugh Willoughby, reflect the greatest credit on his good sense, knowledge, and humanity.

After the Russia trade was established, the exertions of Cabot were continued: the journal of Stephen Burroughs, who was dispatched as commander of a vessel in 1556, shows the character of Cabot in a favourable light. Speaking of a visit to the vessel at Gravesend, previous to her departure, he says, 'the good olde gentleman, Master Cabota, gave to the poore most liberal times, wishing them to pray for the good fortune and prosperous success of the Serchthrift, our Pimessoe?' and at an entertainment afterwards, 'for very joy that he had to see the towardness of our intended discovery, he entered into the dance himself amongst the rest of the young and lusty company.'

The death of Edward VI. and the succession of Mary put an end to the enterprise of Cabot. His pension was continued until May, 1557, when it was renewed, not to him exclusively, but jointly with one William Worthington, of whom little is known. To this person all the maps and documents of Cabot were delivered, and it has been supposed that by his means they were either destroyed or put into the possession of Philip of Spain, the husband of Mary; certain it is that they are no longer to be found.

It is not known when or where Cabot died; although his friend Eden, in his dedication to the translation of 'Tasmanius' Treatise on Navigation,' gives an account of his death. He says, speaking of a mode of finding the longitude, 'Cabot, on his death-bed, tolde me that he had the knowledge thereof, by divine revelation, yet so that he might not teach any man.' Eden thought 'the good old man in that extreme age somewhat doted, and had not yet, even in the article of death, utterly shaken off all worldly vaine glorye.' (*Memoir*, p. 223; see also Hakluyt, Purchas, Cooley, and Anderson's *History of Commerce*.)

CABRAL. [BRAZIL, vol. vi., p. 369.]

CABRERA (the ancient Capraria), a small island of the Balearic group, S. of Majorca, and about 10 miles from its southernmost point, Cape Salinas. It is about 4 miles long and 3 broad, is rocky and barren, and only frequented by fishermen. During the war of the Spaniards against Napoleon, Cabrera was the place of confinement of several thousand French prisoners who were taken by the Spaniards in Catalonia and other parts of Eastern Spain. It was an abode wretched enough, though in some respects preferable to a walled prison or a hulk. The prisoners were left to themselves, without any guards, and had the whole range of the island, from which they could not escape. An allowance of bread was sent to them in a vessel from Majorca, but at times, in consequence of bad weather, the prisoners were in danger of being starved. Some lived in dry cisterns or caves, others in bivouacs or huts made of loose stones, as there appears to have been no building of any sort on the island. French ingenuity contrived to make the best of the matter. The prisoners formed little gardens, and established schools for mathematics, drawing, music, dancing, and fencing; they even established a theatre in a large hall. During several years they received no clothing, and consequently were almost naked. They had but one axe and one saw among them all: the Spaniards left them one donkey for their use. The account of their mode of

living forms a very interesting picture. (*Adventures of a Serjeant*, London, 1826.)

SABUL, or CAUBUL. [AFGANISTAN, vol. i. p. 169.]

SABUL, or CABULISTAN. [BELOOCHISTAN, vol. iv. p. 198.]

CACAO, or, as it is commonly called, Cocoa, is the bruised seeds of the theobroma cacao, a tree belonging to the natural order Stercaceae. The seeds are oval, about as large as an olive, obtuse at each end, compressed, and covered with a violet or ash-grey skin, which encloses two irregularly-cut and plaited cotyledons, of a fatty nature, and of a brownish-black or violet-colour. The properties of these seeds are owing to the presence of a fixed concrete oil and an agreeable aromatic principle. Simply bruised they constitute the cocoa of the shops; reduced to a paste, mixed with sugar and flavoured with vanilla, they become chocolate. They are imported from several of the West India islands, from Caracas, from Guayaquil, from Brazil, in all which places the tree grows wild, or is cultivated for the sake of its seeds. It has been estimated by Humboldt that the consumption of cacao in Europe was, in 1806, 23,000,000 lbs. For a description of the tree and its mode of culture see THEOBROMA.

The quantities of cacao imported into, re-exported from, and consumed in this country in each of the five years from 1831 to 1835, were—

	Imported.	Re-exported.	Consumed
1831	3,487,118 lbs.	1,531,131 lbs.	502,806 lbs.
1832	2,971,019	1,798,264	1,150,197
1833	4,608,718	2,351,877	1,268,287
1834	2,984,894	2,205,316	1,173,795
1835	2,088,952	2,481,133	1,085,980

The great increase in the consumption between 1831 and 1832 was occasioned by the reduction of the duty in the latter year from sixpence to twopence per pound.

CACERES (Castra Cæcilia, Castrum Cæsaris, and Casa Cæris), a town of the Vectones or Vettones, in ancient Lusitania, was till lately the capital of the district (partido), and is now that of the province of its name in Estremadura. It is reduced to 10,000 inhabitants (half the number it had before the disastrous ferment of Portugal), and to some 30 fine houses; but it has still many more large houses, besides a new court of justice (audiencia), an hotel de ville, a public seminary, an asylum for invalids and orphans, and a few manufactories. It possesses numerous inscriptions and other Roman antiquities, mentioned by Ponz (*Viage de España*), and by Laborde (*Voyage Pittoresque d'Espagne*, vol. ii.); and moreover interesting ruins had been discovered about 300 yards from the town, and also at Aldehuela and the hermitage of St. Otalla. It enjoys the best climate of Estremadura, with abundant and excellent springs, united to a rich soil, chiefly appropriated to pasture for oxen and sheep. Caceres is noted for its fine Merino wool.

Caceres is in 39° 25' N. lat., 6° 15' W. long., and 146 miles W. S. W. of Madrid.

CACHAR, a province in the N.E. quarter of Hindustan, bounded on the N. by the Brahmapootra river and Asam; on the E. by Manipoore and the Burmese territory; on the S. by Silhet and Tipurah; and on the W. by the principality of Genthah. This province is situated between 24° and 27° N. lat., and between 92° and 94° E. long.: its length from N. to S. is about 140 English miles, and its breadth from E. to W. about 100 miles.

The ancient name of Cachar was Hairumbo. The province comprehends two divisions, Cachar Proper and Dharmapore; the first occupying the S. and the second the N. part of the province. The country in general is mountainous; to the N. is a branch of the Garroy mountains. In the S. and S.E. is a continuation of the hills of Tipurah, which stretch to the N. as far as Cospore, the capital of the province, where they turn abruptly to the W. to meet the Brahmapootra. The height of these hills varies from 600 to 1000 feet; the west slope is very rapid, and even precipitous. The Bhayani mountains are about 40 miles S.E. of Cospore. The greater part of the mountains are covered with forest trees, bamboos, and jungle, which frequently render them inaccessible; the passes over them are not practicable at all seasons, and these natural difficulties have not been removed by the construction of roads.

A great number of small streams have their sources in the high lands of Cachar. Those in the eastern mountains unite and form the rivers Capili and Barak, both of which join the Megna or Brahmapootra; the Barak at the point

(lat. 24° long. 91°) where the name of the Megna. At certain seasons the Barak can be navigated; in the dry season the channel is obstructed by rocks; but soon after the monsoon has set in, the river has a depth of from 40 to 45 feet of water. From June until November, considerable tracts are inundated, and the facility of travelling is consequently

The jungle fever, a disease often fatal to Europeans, is common in Cachar, owing doubtless to the uncleared state of the country and the frequent occurrence of stagnant water. This disease, however, does not appear to be hurtful to the natives, who are described as being strong and healthy in appearance. The Cacharies are of finer complexion than the Bengalese, and more resemble Chinese in their cast of countenance. The country is thinly inhabited. The entire population has been estimated at 80,000 individuals, or about 360,000 individuals, but this estimate is very far in excess. The best peopled districts are those nearest to the S.W., and a level tract in the N. near to the Capili river and adjacent to the town of Dharmapore.

Cospore, the modern capital, is 20 miles S. of Grobaze, the ancient capital of Hairumbo, in 24° 45' N. lat., and 92° 45' E. long., and on the banks of a small stream called the Madhura. The rajah of Cachar having, in 1811, removed his residence to Doodputlee, a small town about 18 miles farther N., Cospore has since gone on to decay. The town of Dharmapore, in the northern district of the province, and about 60 miles from Cospore, was formerly a place of some strength, and enjoyed a considerable trade, but the fort has now fallen into decay, the town has in a great measure left the place, and its population has decreased. In the time of its prosperity the revenue derived from this town was greater than that from all the remaining parts of the province.

Cachar was invaded by the Burmese in 1774, but the force first sent was destroyed by the jungle fever. A second expedition reduced the rajah to submission, and forced him to become a tributary of the king of Ava. The rajah of Cachar was summoned to Ava in 1810, but he refused to go, and the Burmese monarch sent a force against him. Finding himself unable to resist, the rajah placed his territory under British protection, but having immediately after been deposed, his successor refused to abide by the treaty that had been drawn up. This usurper having been in his turn displaced, a British detachment entered Cachar and expelled the Burmese, whom they forced to renounce all pretensions to sovereignty in the province. In return for the protection thus given, the rajah agreed to pay to the English government an annual tribute of 10,000 rupees.

(Hamilton's *East India Gazetteer*; *Report of Committee of House of Commons on the Affairs of India*, 1832.)

CACHET, LETTRES DE, were letters proceeding from and signed by the kings of France, and countersigned by a secretary of state. They were called also 'lettres closes,' or 'sealed letters,' to distinguish them from the 'lettres patentes' issued by the great council. Lettres de cachet were rarely employed to deprive any of their personal liberty before the seventeenth century. They were previously made use of occasionally as a means of delaying the course of justice; but during the reign of Louis XIV. they were obtained by any person who had sufficient influence with the king or his ministers, and persons were imprisoned for life, or for a long period, on the most frivolous pretexts, for the gratification of private pique or revenge. The terms of a lettre de cachet were as follows:—'M. le Marquis de Launay, je vous fais cette lettre pour vous dire de recevoir dans mon château de la Bastille le Sieur —, et de l'y retenir jusqu'à nouvel ordre de ma part. Sur ce, je prie Dieu qu'il vous ait, M. le Marquis de Launay, en sa sainte garde.' These letters, giving power over personal liberty, were openly sold in the reign of Louis XV. by the mistress of one of the ministers. The lettres de cachet were also granted by the king for the purpose of shielding his favourites or their friends from the consequences of their crimes; and thus were as pernicious in their operation as the protection afforded by the church to criminals in a former age. Their necessity was strongly maintained by the great families, as they were by them enabled to remove such of their connexions as had acted in a derogatory manner. During the contentions of the Mirabeau family, 59 lettres de cachet were issued on the demand of one or other of its members. The independent members of the

parliaments and the magistracy were proscribed, and punished by means of these warrants. This monstrous evil was swept away by the Revolution, after Louis XVI. had in vain endeavoured to remedy it.

(Mirabeau, *Des Lettres de Cachet*, 1782; and *Translation*, published at London, in two volumes, in 1787.)

CACHICAME. [ARMADILLO, Section I.]

CACIQUE, a Mexican word which signifies 'lord' or 'master.' It was generally adopted by Spanish writers to signify the chiefs, governors, or principal personages of those American tribes with whom the Spaniards became acquainted by their conquests in the New World. (Solis, *Hist. de Nuev. Esp.* iii. 3; *Diccionario por la Real Academ. Esp.*)

CACTUS, the old name of a group of plants, once considered to form a single genus, but now, in consequence of modern discoveries, elevated to the rank of a natural order called cactaceæ or cactew.

The fructification of these plants consists of a calyx adhering to the ovary, with a border divided into an uncertain number of segments, which are arranged in several rows, the one overlapping the other, and the innermost gradually ceasing to be green and leafy, but acquiring the delicacy and colour of petals. The latter usually pass into sepals by insensible gradations, are very numerous, and often brilliantly coloured. The stamens originate in the orifice of the tube formed by the combination of the petals and sepals, are very numerous, and consist of delicate thread-shaped filaments terminated by small roundish anthers. The ovary, which, in consequence of its adhesion to the sepals, seems to occupy the place of the stalk of the flower, consists of a single cell, lined with parietal placentæ covered over with minute ovules; its style is slender; the stigma is star-shaped and divided into as many narrow lobes as the ovary contains placentæ. The fruit is a succulent berry, marked at the end by a broad scar formed by the separation of the limb of the calyx: it contains a great quantity of seeds, which consist of nothing but a skin containing a succulent embryo slightly two-lobed at the upper end.

In natural affinity these plants have been considered allied to the gooseberry tribe (GROSSULACEÆ) on account of the great similarity in the structure of their fruit, and in the general production of spines upon their branches. But in the opinion of others (Lindley's *Nat. Syst.*, ed. 2., 51) this is not the most correct mode of considering their relationship, which is probably far greater with Ficoideæ or Mesembryaceæ, and the other epigynous orders of polypetalous dicotyledons.

The habit of cactaceæ is remarkable. They have a very succulent stem, in which the woolly system is developed in but a small proportion compared to the whole mass. Usually the stem is angular or deeply channelled, occasionally it is destitute of both angles and channels, but in that case is mostly either much compressed as in the opuntia tribe, or leafy as in the epiphylla. Sometimes it is continuous from the base to the apex, but in many instances it is divided off into regular joints, each of which has a similar form varying with the species; in these instances however it is worthy of remark that as the stems advance in age the angles fill up or the articulations disappear in consequence of the slow growth of the woody axis and the gradual development of the cellular substance; so that at the end of a number of years, which vary according to the species, all the branches of cactaceæ, however angular or compressed they originally may have been, become trunks that are either perfectly cylindrical or which have scarcely any visible angles. This metamorphosis is one of the causes which render it so difficult to identify species that have been described in their native localities from full-grown specimens, with such as are cultivated in the gardens of Europe. The greater part of the species have stems which are more or less elongated, but in some they are spherical, as in the whole genera melocactus and echinocactus: whatever may be the form of the stem, they usually bear upon their surface little tubercles which at an early age lose the leaves. Those organs however rapidly fall away, and are succeeded by tufts of hairs or spines hooked backwards at the ends, and then the cacti have the appearance of being perfectly leafless.

All the species are believed to be natives of America, whence however some of the opuntias have been so long introduced to the old world that they have here and there taken possession of the soil, and appear like aboriginal in-

[Melocactus communis.]

habitants. Such is the case on the volcanic soil of Ætna, and in various places on the shores of the Mediterranean; and thus has led to the erroneous idea entertained by Sprengel and others that the opuntia of Theophrastus was the opuntia vulgaris of modern botanists. Cacti are chiefly found in the tropical parts of America, a few species only escaping from those countries; as for example, to the southern states of North America, and to the highlands of Chili and Mendoza. They principally occur on hot dry rocks or plains where the commoner forms of vegetation could not exist, and may be considered one of the means which nature has provided for the support of man in regions where neither food nor water can be procured. Their stems are filled with an abundant insipid wholesome fluid, and their fruit is succulent and in many cases superior to that of European gooseberries. In the fevers of their native countries they are freely administered as a cooling drink; and being bruised they are esteemed a valuable means of curing ulcers. For the sake of such their uses, because of their rapid growth, and especially on account of the numerous spines with which they are armed, the opuntias, or tunas, as the Spanish Americans call them, are much planted round houses as fences, which neither man nor animals can easily break through. They are not unfrequent in the dry forest lands of Brazil, but are said never to occur in the damper parts of the country. In stature they vary greatly, many of them having small creeping stems which seem to crawl upon the ground among the dead branches of the surrounding trees, with whose grey colour their deep green shoots form a singular contrast. Others also like candelabra, with many angular ascending arms, while a few elevate their tall and deeply channelled leafless trunks far above the stunted vegetation of the sterile regions they inhabit, reaching sometimes the height of thirty or forty feet.

To enable them to endure the excessive drought to which they are naturally exposed they are furnished with an unusually tough skin, the evaporating pores or stomates of which are few in number, and very often to all appearance merely rudimentary. This contrivance prevents their losing the scanty moisture which they collect from the burning soil, and enables them to sustain the full ardour of the brightest equinoctial sun without inconvenience, in this respect re-

sembling the succulent fruits of Europe, such as the plum, the grape, the peach, &c., which by the absence of stomata from their tough skin are equally enabled to bear the powerful action of the bright sun that is necessary for their maturation.

These facts teach us what the points are that it is most necessary to attend to in the cultivation of the numerous species which now abound in our gardens. Their skin is so formed that perspiration takes place very slowly through it, unless under the influence of powerful stimulants, and when in a young state. It is, therefore, obvious that they should be sparingly watered or not watered at all during a considerable period of the year. Dry as the places usually are in which cacti naturally grow, they are periodically visited by heavy rains, which, combined with a bright light and a high temperature, force into activity even the sluggish vital powers of such plants as those under consideration. At such a time the annual growth of a cactus takes place, secretions which enable the species subsequently to form its flowers are deposited, and a general impulse is given to all the torpid energies of its constitution. But by degrees the rains moderate and finally cease, the young cuticle, which at its first formation perspired freely, becomes thicker and tougher and impermeable to moisture; what food has been obtained during the short period of growth is securely enclosed within the recesses of the stem, and when the air and earth become dry the plant is provided with the means of enduring another long period of fasting and inactivity. With the fall of rain the heat moderates, but the light to which the cacti are exposed is but little, if at all, diminished, so that the assimilation and alteration of the food contained within the stem keeps continually going on, however slowly. It is by following this natural course of events that gardeners have succeeded in bringing their cacti to that extraordinary state of beauty for which they are now conspicuous; it is by attending practically to such points in the habits of the species that we obtain the myriads of large, brilliant, red, or bluish or snow-white blossoms that form the glory of our greenhouses in the spring. A cactus is placed in a damp stove, exposed to all the light that can be collected without being concentrated, and it begins to grow: it is then watered, at first gently, afterwards copiously with water holding a quantity of organizable matter (manure) in solution; this practice is continued for three months, when the quantity of moisture is diminished, and the temperature is lowered, but exposure to light is still attended to, till at last the plant sinks to rest. In this state it is kept till the season for again forcing it into growth shall have returned, when it is subjected to a repetition of the same treatment as before.

If cacti are to be propagated, their branches or joints, if they have any, are cut off, a little dried, and then placed in a hot and damp place, when they strike root immediately. Among the practical consequences, De Candolle observes, that result from the facility with which they are thus multiplied, is one which deserves to be noticed on account of its importance: viz., the manner in which the opuntia is employed to fertilize the old lavas at the foot of *Ætna*. As soon as a fissure is perceived a branch or joint of an opuntia is stuck in: the latter pushes out roots, which are nourished by the rain that collects round them, or by whatever dust or remains of organic matter may have collected into a little soil: these roots, once developed, insinuate themselves into the most minute crevices, expand, and finally break up the lava into mere fragments.* Opuntias treated in this manner produce a great deal of fruit, which is sold as a refreshing food throughout all the towns of Sicily.

Where however the species have neither branches nor joints, as is the case with some of the melocacti and echinocacti, a different mode of propagation is had recourse to: it is then necessary to compel them to branch by artificial means. Each of the numerous tufts of spines that occupy the ridges of their stems is a bud, and is capable of being forced into a branch, if by any means the general tendency to grow at the upper extremity only is checked. This is effected either by burning the apex of the plant with a broad flat iron, or by cutting the plant across below the top, in either of which cases several of the spiny buds will gradually swell and develop themselves as little branches, which, being broken off, will strike root and become new plants.

The interest that attaches to the cultivation of these curious objects has led us to go into more than our usual

details concerning them, and there is still a variety of topics not adverted to. We have only, however, room for some observations upon the employment of certain species of opuntia for the feeding of the cochineal insect. Upon this subject we have availed ourselves of the information contained in Professor De Candolle's important memoir upon the family of Cacti. It is probable that the cochineal insect feeds upon several species of opuntia. The least spiny kinds are usually employed, because it is most easy to collect the species from them; but this circumstance does not appear to influence the choice of the insect when left to itself. The latter seems, according to the accounts of travellers, to prefer the sorts with red flowers, and to neglect those whose blossoms are yellow; at least such is the case with the three species most extensively cultivated, viz., *Opuntia Tuna*, which seems the most employed in Peru, *O. Hernandezii*, which is the most celebrated in Mexico, and *O. cochenillifera*, the native province of which is somewhat doubtful.

Opuntia Tuna has been figured in Dillenius's 'Hortus Elthamensis,' tab. 380, and is the original of what Linnæus called *Cactus Tuna*: it has been since called *Cactus Bonplandii* by Mr. Kunth. It differs from the two following in the long whitish spines that arm it, in its very broad oval joints, its fully-expanded flower, which resembles that of *O. Hernandezii*, except that it is larger. This is the sort which in the Paris garden nourishes the wild cochineal: it was brought from Peru by Dombey, and according to Humboldt is in much esteem in that country as the food of a valuable sort of cochineal.

Opuntia Hernandezii has been pretty well figured for us by Hernandez, under the vulgar Mexican name of Nopalnochetzi. Subsequently Thierry de Menonville, in his 'Journey to Guaxaca,' published a figure and description of it under the name of Nopal Sylvestre. It is chiefly cultivated in the temperate parts of New Spain bordering on the Pacific. It is clearly distinguished from the following by its expanded flower, and its stamens shorter than either the petals or the style. The joints of its stem moreover are smaller, shorter, thicker, and more regularly oval.

Opuntia Cochenillifera is known by the figure of Dillenius in the 'Hortus Elthamensis,' t. 297, f. 383: it has also been well represented by Sir William Hooker, in the 'Botanical Magazine,' t. 2741 and 2742. Nevertheless, notwithstanding its name, it is the species about which there is the most doubt with regard to its feeding the cochineal. It is possible indeed that it may be the sort which Thierry de Menonville calls the Castilian Nopal, which he found in the highest estimation as food for the insect; but this is very much matter of conjecture.

CADE, JOHN, an Irishman, who pretended, and was believed by some, to be a bastard relation of the duke of York, and hence assumed the name of Mortimer. Shakespeare has made him familiarly known to us as 'Jack Cade.' The insurrection which he headed broke out in Kent in the beginning of June, during Whitsuntide week, in the year 1450, and had its origin in the wide-spread dissatisfaction occasioned by the conduct of the duke of Suffolk, the favourite and chief minister of the king. A list of their grievances was published by the insurgents, entitled 'The Complaint of the Commons of Kent.' Among other complaints alleged by the insurgents were the following:—'That people paid not for stuff and purveyance taken for the king's use; that the king's lands in France are aliened and put away from the crown; that the people of Kent are not suffered to have free elections of knights of the shire.' In addition, Cade sent a memorial to the king, expressive of great loyalty, entitled 'The Requests by the Captain of the great Assembly in Kent,' praying him 'to take about his person his true lords, and to avoid all the false progeny and affinity of Suffolk,' and affirming that 'the realm of France, the duchies of Normandy, Gascony, Guienne, Anjou, and Maine, were delivered and lost by means of the said traitors.' This last circumstance especially irritated the nation; and to these causes of discontent were added the hardships caused by the statute of labourers and extortionate proceedings which vexed and irritated the commonalty. On the 17th of June, Cade and his followers were encamped at Blackheath. The king, who was with the parliament at Leicester, hastily collected his forces at London, and prepared to march upon the rebels. During this interval, Cade sent to the king the memorials which have been mentioned. Cade had been encamped about a

week when the king's forces marched to attack him, upon which he hastily retreated to Sevenoaks. The royalists, believing the rebels were in flight, detached a portion of their forces in pursuit; upon which Cade led his followers against this detachment, which was defeated, and Sir Humphry Stafford and his brother, who commanded it, were amongst the killed. Cade now resumed his encampment at Blackheath. The royalists were distrustful of their followers, and as a popular concession, the king's council committed to the Tower Lord Say and some others, who were disliked by the people on account of their connexion with the obnoxious ministry. The king's army then returned to London and dispersed. The archbishop of Canterbury and the duke of Buckingham were sent to negotiate with Cade, but he refused to lay down his arms until his demands were acceded to. On the 1st of July he marched from Blackheath for London. Some of the common council advised the admission of the rebels; and an alderman who opposed it was taken into custody. It was resolved that a neutral part should be taken, and the gates were opened to the insurgents. Cade rode through the streets, and struck the old London stone with his sword, exclaiming 'Now is Mortymer lord of this city.' He issued proclamations forbidding plunder, and each day withdrew his followers into the Borough to prevent disorder. On the 3rd of July, Cade sent for Lord Say, and had him arraigned at Guildhall. This nobleman claimed to be judged by his peers, on which he was taken by force to the Standard in Cheapside, and there beheaded. The sheriff of Kent, Lord Say's son-in-law, was also beheaded, on account of his alleged extortions. The mob soon began to exhibit the usual characteristics of an undisciplined multitude. On the third day of their being in possession of the city some houses were plundered: Cade himself plundered the house where he had dined. This conduct decided the citizens, who concerted measures with Lord Scales, the governor of the Tower, and it was determined to defend the bridge and prevent the entry of the rebels. The struggle lasted during the night, but the bridge was eventually taken by the royalists, and a short truce was agreed upon. In this interval the bishop of Winchester was sent by the archbishops of Canterbury and York, who were in the Tower, with a pardon under the great seal to all the rebels who were disposed to return to their homes. The offer was accepted by the mass of them, including Cade. Two days afterwards he again invited his followers to his standard, but they flocked around it in diminished numbers, and to attack the city was now hopeless. He therefore retired from Southwark to Rochester, where tumults and quarrels arose among the insurgents respecting the division of booty. On this Cade left them, and fled on horseback to Lewes, in Sussex. A reward of 1000 marks being set upon his head, he was taken by an esquire named Alexander Iden, and killed, after a desperate resistance, July 11. His head was placed on London bridge. The remainder of the rebels returned to their homes as quietly as possible. Some were taken and executed. (Sharon Turner's *History of England during the Middle Ages*, vol. iii. p. 181; Lingard's *History of England*, vol. v. p. 182.)

CADENCE, in music (*cadenza*, Ital., *cadence*, Fr., from *cado*, Lat., *to fall*), the close of a musical passage or phrase, or the resolution of a dissonant chord into a consonant one.

Cadences, which are in some degree analogous to punctuation in grammar, are resting places for the mind, serving to divide a composition into several parts, or to separate the different members of a musical sentence. They are either Perfect or Imperfect. The Perfect Cadence is composed of the chord of the Dominant, followed by that of the Tonic; likewise of the chord of the Dominant Seventh, succeeded by that of the Tonic.

Examples.

The first and second inversions of the Dominant Seventh, followed by the chord of the Tonic, also form Perfect Cadences, but are rarely used as final Cadences.

Examples.

The Imperfect Cadence consists of the chord of the Tonic, followed by that of the Dominant, but is never met with as a final close, except in some very few old ecclesiastical compositions.

Albrechtsberger gives the subjoined formulæ of this Cadence.

No. 1.

No. 2.

But in No. 2, the introduction of the F sharp changes the key: G therefore is no longer the Dominant, but becomes the Tonic; consequently a composition thus ending terminates irregularly, and not with an Imperfect Cadence, if the accepted definition of the latter be correct.

Besides the Perfect and Imperfect Cadences, many writers speak of the *Interrupted* or *Deceptive* Cadence. It is formed by a chord quite foreign to that which was expected, thus evading the close, and deceiving expectation.

Example.

There is also another kind of Cadence, to which the name of *Plagal* is given; and this is sometimes classed as an Imperfect Cadence. It consists of the chord of the Subdominant, followed by that of the Tonic, and is occasionally used in church and other sacred music.

Example.

Sometimes in this Cadence the chord of the Subdominant is suspended on part of the final Tonic.

Example.

The term *Cadence* is also used to signify the addition made by the performer at the close of an air or concerto, and supposed to be an extemporaneous effusion, for the purpose of displaying such taste, skill, and power as the composition itself affords no means of exhibiting. The *Cadenza*, however, if introduced at all, should always be in good keeping with the air, &c., to which it is appended; it ought to preserve the same general character, and should invariably be brief, in the instance of vocal music especially. Formerly the *Cadenza* was, by Italian as well as English singers, considered indispensable, and many were the incongruous flights of ill-regulated fancy that audiences had to endure. The French never admitted it; the Italians have now wisely discarded it; the English alone retain what most sensible and reflecting people view as an absurdity, and what in a few years will, even in this country, be known only historically, for reason is beginning to have some sway over our performers: though they follow slowly in the march of intellect, they do not remain quite stationary, and already symptoms of an improved mode of thinking is manifest in some whose example will be influential.

The *Cadenza* is so called, says Rousseau, because introduced generally on the first note of the final Cadence.

CADER IDRIS is one of the highest mountains in North Wales. Though this name properly belongs to one peak, it has been extended to the whole western portion of the Berwyn mountains, which stretches from the peak to the sea-coast. This ridge begins near $52^{\circ} 35'$ N. lat., and $4^{\circ} 5'$ W. long., on the shores of Cardigan Bay, or rather in the bay itself; for the Sarn y Bweh, a ridge of huge stones which runs out into the bay and is bare at low water, may be considered as its commencement. The W. extremity of the Cader Idris mountains is about a mile N. of the small town of Towyn. Hence it proceeds with a gradual but almost constant ascent, first N. for about three miles, and then for about ten miles farther it runs E.N.E. till it joins the peak itself. Its breadth bears but a small proportion to its length; for a line passing across its base and intersecting its summits would scarcely be four and a half miles. In some parts it is a mere ridge, whose base hardly ever exceeds one mile in breadth. Its slopes are very steep and craggy on each side, more especially so on the S. slope: near Tallylyn lake the rocks rise nearly perpendicularly.

The peak, which stands at its E. extremity, rises to the elevation of 2914 feet above the sea, and in height is the third mountain of Wales. It consists of an immense rocky mass, of rather difficult ascent, on the summit of which is a small plain, with two rocky heads of equal height, one looking to the N. and the other to the S. The view from its summit is very extensive: the mountain rises so far above all the hills which lie farther E., that the Wrekin in the plain of Shropshire is visible from it. Its sides, though mostly destitute of vegetation, present some variety, from having several small alpine lakes imbedded in the depressions of the rock. The rocks themselves are of primitive formation, consisting chiefly of different kinds of porphyry. (A. Aikin's *Journal of a Tour through North Wales*; and Davies's *Agricultural View*.)

CADI, or, according to the Persian pronunciation of the word, *Cadzi*, sometimes written *Kazee* or *Kauzee*, is an Arabic word and the designation of an officer who was originally the supreme civil judge in all Mohammedan countries. In the Mohammedan states in India the cadi continues to be the chief judge; but in Turkey he is subject to the Mufti, and in Persia he stands under the Sheikh-ul-Islâm or supreme judge (literally 'the elder or chief of the faith'), in all the principal cities where an officer of that rank resides, and the latter functionary has in general the further gratuitous aid of the council of Mullâs (Moollahs) or learned men. There is also in Persian courts of justice an officer, who has the title of Mufti, but without possessing the high authority

of the office thus designated in Turkey: he must be a man of learning, whom the cadi consults for his advice upon subjects of intricacy, and who expounds and applies the law to cases, leaving the cadi to give it operation and effect. The total number of cadis in the Turkish empire at the time of Muradgea d'Ohsson was 465: their rank was proportionate to the importance of the towns in which they resided. The cadi of the Turkish capital had always been considered as the first of the Ulemâs, or Jurisconsults, of the empire: Murad I. (A.D. 1421—1451) conferred upon that officer the title of Cadi-askar, i. e. 'judge of the army.' His successor, Mohammed II., (1451—1481) appointed two functionaries of that rank at Constantinople; and Suleiman I. (1519—1566) made them both subordinate to the mufti or chancellor of the empire.

The law of all Mohammedan nations, which is administered by the cadis, is founded partly on the Koran, and partly on the Sunnah or tradition; but in Persia, since the establishment of the faith of the Shiites as the national religion of the country, jurists have rejected all traditions coming from the three first caliphs Abu Beer, Omar, and Osman, or from other persons who opposed the right of Ali to the succession of Mohammed.

It is insisted upon as one of the principal duties of a Mohammedan sovereign to appoint fit persons to the office of cadi. The prophet is recorded to have said, 'Whoever appoints a person to the discharge of any office, whilst there is another amongst his subjects more qualified for the same than the person so appointed, does surely commit an injury with respect to the rights of God, the prophet, and the Mussulmans.' The appointment must not be solicited or coveted; for the prophet has said, 'Whosoever seeks the appointment of cadi shall be left to himself; but to him who accepts it on compulsion, an angel shall descend and give directions.' A cadi, to make his appointment valid, must possess the qualifications of a witness, i. e. he must be free, sane, adult, a Mussulman, and unconvicted of slander. With reference to other qualifications required in a cadi, considerable diversity of opinion seems to exist among the different schools of Mohammedan jurists. According to the Hanefite school a cadi does not forfeit his office if, at the time of his appointment, he be a just man, and afterwards, by taking bribes, prove himself unjust; neither does that school consider the appointment of an ignorant man to the office of cadi as invalid, inasmuch as he may render to every subject his just rights by passing decrees according to the opinions of others. But the followers of Shâfi'î maintain, that an unjust man is as incompetent to the office of cadi as to give evidence; and that the appointment of an ignorant man is not valid, because it supposes a capability of issuing decrees, and of deciding between right and wrong, which acts cannot be performed without knowledge. The cadi should administer justice in some public place: the Hanefites recommend the principal mosque of the town, because they consider the duty of the cadi to be of a pious nature, and because the prophet has said 'Mosques are intended for the praise of God and the passing of decrees; but to this the Shâfi'îs object, as the place of worship would, in their opinion, be profaned by the approach of polytheists and other impure persons who attend the court of the judge. It is not lawful for a cadi to receive presents, except from near relations (within the degrees prohibited for intermarriage), or old and intimate friends; neither must he accept invitations to any feast or entertainment, unless it be a general one, and not given to him in particular. In his conduct to the parties in a suit the cadi should observe strict impartiality, behaving to both with an equal degree of attention; and likewise in his conduct towards witnesses in court he should be guided by the greatest caution, in order not to give the one a confidence above the other. He is moreover directed not to give judgment when he is hungry or thirsty, or at a time when his mind is not perfectly clear and unbiassed. A cadi is not permitted to appoint a deputy, unless by the authority of the imâm or spiritual superior; but the decrees of a deputy, whom he may have appointed without such authority, if passed in his presence or with his approbation, are valid, and if he appoint a deputy by authority of the imâm, he cannot afterward dismiss him, as the agent so appointed becomes the deputy of the sovereign himself. (The *Hedâya*, or *Guide*; a *Commentary on the Mussulman Laws*, translated by Charles Hamilton, vol. ii., p. 612, &c.; Malcolm's *History of Persia*, vol. ii., p. 445, 4to. edit.; Muradgea d'Ohsson, *Tableau de l'Empire Ottoman*, t. i., p. 569-573,

Harrington, in the *Asiatic Researches*, vol. x., p. 475-514.)

CADIZ (called Cadix by the Spaniards), the principal commercial city of Spain, is situated on the S.W. coast of that kingdom, in the province of Andalusia, in 36° 31' N. lat., and 6° 19' W. long. The city, which is built on the extremity of a low narrow tongue of land, projecting about five miles N.N.W. from the island of Leon, is consequently surrounded on three sides by water. On the S.W. is the open sea, and on the N.E. is a deep bay formed by the peninsula and the mainland. The entrance to this bay lies between the city and the promontory of Rota, distant about five miles and a quarter N.W. by N. from Cadiz. The bay is of great extent, being nearly twelve leagues in circuit. It affords good anchorage; but the outer part is exposed to a heavy and dangerous sea during the prevalence of N.W. winds. The inner part is protected by an extensive mole, but the water is not sufficiently deep to allow ships of great burthen to approach nearer to the town than three-quarters of a mile, where there is from five to seven fathoms water. At the entrance of the bay N. of the peninsula are sunken rocks, called the Cochinos, the Puercas, and the Diamante; the first and second of these are about three-fifths of a mile, and the Diamante about a mile and a half from the city. Ships may pass in and out between the Puercas and Diamante, but only smaller vessels, piloted by persons well acquainted with the channel, can safely venture between the Cochinos and the Puercas. On the side of the bay opposite to Cadiz is the town of Santa Maria, which is the principal depôt of the wines of Xeres.

The city is defended by ramparts, regular bastions, and several outworks. It is inaccessible and almost unsailable towards the sea, the shore to the S.W. being very steep, while to the N. it is defended by sand-banks and the sunken rocks already mentioned. The bay is defended by the four forts of St. Sebastian, St. Catherine, Louis, and Matagorda. The town has five gates, only one of which is on the land side. Between the ramparts and the sea, on the side towards the bay, are large and handsome promenades planted with trees.

The city is in form nearly a square, the sides of which are about one and a half English miles. The streets, which are well paved and lighted, and usually clean, are in some parts narrow, but not generally so; they are laid out with some regularity, and most of them cross each other at right angles. There are several squares, one of which, that of St. Antonio, is very handsome. The houses in the city are well built, in the style which was introduced by the Moors: they have two stories, with a square court in the centre surrounded by a double gallery. In hot weather an awning is spread over this court, and is sprinkled from time to time with water. The windows that open to the street have each a balcony, furnished with a *jalousie* blind to exclude the sun. The number of churches and convents is not so great in proportion to the population as is usual in the towns of Spain, but the proportion of hospitals and charitable institutions is greater. The town is badly supplied with water: That which is raised from wells is brackish and unwholesome. Rain-water is collected in cisterns; but the principal supply comes from the town of Santa Maria, between which place and Cadiz vessels are constantly passing with water. The tower or light house of St. Sebastian, which stands on the western side of the city towards the sea, is a very conspicuous object. The light is 172 feet from the ground, and in clear weather is visible to ships approaching from the Atlantic at the distance of six leagues.

The caraca or royal dockyard, has its entrance defended by the cross fire of the two forts Louis and Matagorda. It contains three great basins and twelve docks, or slips, for the construction of vessels of the largest size. At the time when Spain maintained a considerable navy, the dockyard was furnished with numerous workshops, and its magazines were filled with abundance of naval stores of all kinds. The manufacture of sail-cloth, and of ropes of all sizes up to the largest cables, was carried on in the premises; and upwards of 5000 men, shipwrights and others, were constantly employed throughout the year.

Cadiz was constituted a bishop's see in the reign of Alfonso the Wise, in the year 1264: the church of Santa Cruz was at that time erected into a cathedral. The bishop, whose diocese is of small extent and contains only twenty-eight parishes, is suffragan to the archbishop of Seville.

For a long time this city enjoyed a high degree of pros-

perity, arising from its trade with the Spanish American colonies. Previously to 1720, the monopoly of this trade was enjoyed by Seville, but in that year it was removed to Cadiz, which soon became one of the most opulent cities of Europe; foreigners of all nations had factories and commercial houses there, and the port seldom contained fewer than 500 or 600 vessels. In 1792 the imports from Spanish America were to the amount of 700,000,000 reals, or 7,295,933*l.*; in 1791, the amount of gold and silver, coined and uncoined, received from the same quarter exceeded 5,300,000*l.* This commercial activity was greatly checked by the war of 1793, and has since been wholly destroyed through the defection of the Spanish possessions in America. In the days of its prosperity, it is said that Cadiz hardly contained a person incapable of supporting himself, which state of things is so far altered, that a recent traveller informs us that 'scarce may one go forth into the streets by day or night without being pursued by crowds of beggars, and not unfrequently by women decently dressed, who still preserve a semblance of their former elegance, though begging their daily bread.'

The foreign trade of Cadiz is now in a state of great depression. That part of it which is carried on in Spanish vessels is confined almost entirely to the intercourse with Cuba, Puerto Rico, and the Philippine Islands. The limited trade between Cadiz and the former colonies of Spain on the continent of America, is now carried on in British and other foreign ships. The salt-fish imported from Newfoundland is conveyed in English vessels. Linens, silks, and woollen cloths, are imported from France, mostly in the ships of that country: staves are supplied by the United States of America, in vessels belonging to those states; and timber is imported from Russia and Sweden, in foreign bottoms.

The chief articles of export are wine, salt, fruit, oil, wool, and quicksilver, which are usually shipped in vessels bearing the flag of the country to which the shipments are made. The import and export *legal* trade of the port of Cadiz, during the three years 1833 to 1835, was carried on by the number of ships stated in the following table, in which are given the aggregate tonnage of the vessels, and the estimated aggregate value of their cargoes.

	Inwards Ships.	Tonnage.	Estimated value of carg
1833	291	35,052	£112,120
1834	314	37,506	162,364
1835	294	40,322	141,192
	Outwards.		
1833	294	35,588	£1,105,751
1834	302	35,880	1,118,182
1835	298	40,338	1,222,533

The great difference observable in the value of the inward and outward cargoes furnishes strong evidence of the fact which is otherwise sufficiently notorious, that the far greater part of the import trade of Spain is carried on through smugglers. It has long been the practice of the Spanish government to place restrictions upon foreign commerce. Many articles are wholly prohibited, and upon others so high a scale of duties is imposed, that the regular trade is altogether prevented by the lower rates at which contraband traders will introduce the goods and deliver them to the consumers. This state of things is greatly aggravated by the intricacy and vexatious nature of the custom-house regulations, and by the venality of the revenue officers, by means of which the illicit trade is favoured, while the legitimate trade is discouraged. The duty imposed upon many articles exceeds their original value; and as the smuggler is contented with an advance of from 20 to 25 per cent. in payment for his labour and risk, it is clear that little import trade will be left for the regular merchants. In addition to the government duties, there is a local tax imposed upon all imported goods, amounting to 10 per cent. upon the invoiced value, and from this tax the consumer is wholly relieved by the smuggler.

The prosecution of this contraband trade is greatly facilitated by the British settlement of Gibraltar, which is, in the fullest sense of the word, a free port. People of all nations, in amity with England, may come here for the purpose of trading, and may land, deposit, sell, and take away goods without any impediment whatever, except as regards wine and spirits, some regulations respecting those articles being considered necessary with reference to the health of the garrison. The only charge imposed by the British government is a slight port charge on the re-shipment of goods. With

the exception of the small proportion required by the inhabitants, about 1600 in number, nearly the whole importations of Gibraltar find their way into Spain in defiance of, or in connivance with, the revenue officers of that kingdom. The total exports of British produce and manufactures shipped to Spain from the United Kingdom in 1834, amounted in value to 366,593*l.*, including cotton manufactures to the amount of 32,993*l.* In the same year the shipments to Gibraltar amounted in value to 460,719*l.*, of which 321,727*l.* consisted of cotton manufactures, the duties upon which at the custom-houses of Spain are exorbitantly high. This however forms but a small part of the contraband trade of that kingdom. In addition to the produce which finds its way directly from British colonies or through this country to Gibraltar, and which amounts to a considerable sum, the shipments from the United States, consisting of fish, maize, rice, salt provisions, flour, cotton, staves, tea, and tobacco, are estimated at three times the amount of the English trade. Franco sends to the same depôt every article of her manufacture in which she can undersell this country; and from the north of Europe are sent large quantities of salt-fish, stock-fish, provisions of all kinds, spirits, iron, steel, and spars.

In 1829 Cadiz was made a free port, at which goods might be landed and stored without payment of duties. The effect of this measure was, to render the city the grand focus of the contraband trade above described, and the privilege was withdrawn at the end of 1832.

The coasting trade carried on at Cadiz is of considerable amount: the vessels employed in it are from five to 65 tons burthen, and, including their repeated voyages, from 2000 to 3000 vessels annually enter the port. The goods thus brought to the town consist principally of provisions from the other maritime provinces, wine, brandy, grain, fruit, charcoal, and oil: the return cargoes are chiefly of colonial produce, silk, linen, and woollen goods.

The manufactures carried on in the city consist of soap, glass-ware, coarse woollen cloths, cotton and silk fabrics, the materials for which are spun by the hand, and hats: there are likewise some sugar refineries and tanneries. The *Society of Friends of the Country* has recently introduced the cultivation of the cochineal plant and the production of the cochineal insect. Both thrive well, and through the exertions of the society this branch of industry has been adopted to some extent in the neighbouring district.

Cadiz was founded by the Phœnicians many centuries before the Christian era, but there is no historical evidence as to the time of the settlement. Its Phœnician name was Gadir or Gadeira, which was changed into Gades by the Romans, under whom it became a municipium, called Augusta Urbis, Julia Gaditana. The city stood at the west end of the small island, which was then separated from the mainland by a channel about 600 feet wide: at this part was the Temple of Hercules. The earthquake which nearly demolished Lisbon in 1755 caused the sea to rise and overflow the country about Cadiz to a great extent, on which occasion the ruins of several antient buildings were brought up by the shock, and left behind on the receding of the water. Under the Romans Gades was one of the richest provincial towns in the empire, and a place of great trade.

The city was carried by assault and pillaged and burnt in 1596 by an English expedition under Lord Effingham, who obtained an immense booty on that occasion. It was again attacked in 1702, but not with equal success, by an expedition under the duke of Ormond and Sir George Rooke in conjunction with the Dutch. At the breaking out of the resistance offered by the Spanish nation to the usurpation of Joseph Bonaparte in 1808, the harbour of Cadiz contained a large naval force under the national flag, and a French fleet consisting of five line of battle ships and a frigate. The Marquis de Solano, governor of Cadiz, a man in the interest of France, was on that occasion seized and killed by the inhabitants, who gained possession of their own ships, and proceeded to attack from the batteries those of France, which being prevented from attempting an escape by the English fleet under Lord Collingwood, were forced to surrender to the patriots.

The first assembling of the national cortes when convoked by the central junta in 1810 took place in Cadiz, which in the same year was invested by the French forces under Marshal Victor. The siege proceeded but slowly, and in fact was little more than a blockade, against which the garrison, being open to receive provisions and reinforce-

ments by sea, were enabled to hold out, until on the 12th of August, 1812, the siege was raised, in consequence of the successive advantages gained by the English troops under Lord Wellington.

The king, Ferdinand VII., who, during the progress of the war from 1808, had been detained a prisoner in France, returned to his kingdom at the general peace in 1814, and immediately abrogated the constitution of 1812 decreed by the cortes, and declared that body dissolved. The dissatisfaction that was thus occasioned was rendered apparent from time to time by the breaking out of conspiracies, one of which, in 1820, was so far successful, that the constitution of 1812 was again proclaimed, and the king was made to swear to support it. The jealousy with which these movements were viewed by the French government gave occasion to the assembling on the frontier of a large French army, to which the name of 'cordon sanitaire' was applied, under the absurd pretence of preserving France from the visit of a malignant fever then prevalent in Spain. Having reason to mistrust the sincerity of the king, the cortes, who had been assembled at Seville, obliged him, in June, 1823, to proceed to Cadiz, upon which the French troops advanced and invested that city. The Duke d'Angoulême arrived on the 10th of August at Port St. Mary, and placed himself at the head of 30,000 men. On the last day of that month he succeeded in gaining possession of the Trocadero, a position which commands all the approaches to the city, and opened a communication with Ferdinand, who, on the 1st October, proceeded to the head-quarters of the French, whence he issued an order for the delivering up of the city to the besiegers, who accordingly took possession on the second day after. The French troops retained possession until the summer of 1828. (Strabo, iii. p. 168, &c., Casaub.; Plin., *Nat. Hist.* iv. 22, &c.; Laborde's *View of Spain*; Malham's *Naval Gazetteer*; Townsend's *Travels in Spain*, &c.)

CADMIUM, a peculiar metal discovered in 1818: it was found in some ores of zinc, and especially in the Silesian. On account of the effect which was produced by the action of sulphuretted hydrogen upon some preparations of zinc, the presence of arsenic was suspected, but the appearance was found to be owing to this new metal. The first notice of its existence was by Hermann, but Stromeyer more particularly examined and detailed its properties, and gave it the name of *cadmium*, from *cadmia fossilis*, a name by which the common ore of zinc was formerly known.

In order to separate cadmium from the mineral containing it, it is to be dissolved in sulphuric acid, and the solution, which should have excess of acid, is to be diluted with water, and to have a current of sulphuretted hydrogen gas passed into it, until a yellow precipitate ceases to be formed. This precipitate is sulphuret of cadmium, which is to be dissolved in concentrated muriatic acid, and the excess of acid being expelled by evaporation, the residual salt is to be dissolved in water, and precipitated by carbonate of ammonia, an excess of which dissolves any oxide of zinc or copper that may have been thrown down by the sulphuretted hydrogen with the sulphuret of cadmium. The carbonate of cadmium thus obtained is to be heated to redness, then mixed with lamp-black, and heated to dull redness in a glass or porcelain retort: it is thus reduced, and the metal distilled. The impure Silesian oxide of zinc is stated to contain from 1½ to 11 per cent. of this new metal.

Cadmium has the colour of tin, is brilliant, and susceptible of a fine polish. Its fracture is fibrous, and it crystallizes readily in regular octahedrons; while solidifying, its surface is covered with arborations like fern leaves. It is soft, easily bent, filed, and cut: it stains substances upon which it is rubbed, like lead. When bent it gives a peculiar crackling noise, like tin. It is very ductile, easily drawn into wire and beaten into thin leaves. Its specific gravity after fusion is 8.604, but when beaten 8.694. Cadmium melts below a red heat; and at a temperature a little above that of boiling mercury, it boils and distils in drops. The vapour of cadmium has no particular odour. Like tin it is slowly acted upon by the air, but is eventually tarnished by it.

Oxygen and Cadmium readily unite to form one oxide. It may be procured either by burning the metal, or decomposing a solution of the metal with an alkali, and washing and calcining the precipitate. The colour of oxide of cadmium depends upon its state of aggregation: it is either deep reddish yellow, bright brown, deep brown, or even

black. It is neither fusible nor volatile, even at a very high temperature. Oxide of cadmium is insoluble in water, but is precipitated in the state of hydrate by solution of potash; this hydrate is white, insoluble in the fixed alkalis, but soluble in ammonia. Carbonate of ammonia, however, does not dissolve it, and this difference between it and oxide of zinc serves as a process for separating them. Oxide of cadmium is composed of—

1 Equivalent of oxygen	= 8
1 " " cadmium	= 56

Equivalent of oxide 64

No compound of azote or hydrogen and cadmium is known.

Chlorine and Cadmium combine to form only one chloride: this compound may be obtained by dissolving either the metal or its oxide in muriatic acid. The solution, by spontaneous evaporation, is gradually converted into a mass of short satiny crystals, composed of—

1 Equivalent of chlorine	= 36
1 " " cadmium	= 56
2 " " water	= 18

100

These crystals are readily soluble in water, and effloresce in warm dry air. The effloresced salt fuses below a red heat, and on cooling it assumes the appearance of a transparent lamellated crystalline mass, which has a faint, pearly, metallic lustre. By exposure to the air it acquires water, and falls to powder.

No compound of carbon and cadmium is known.

Sulphur and Cadmium unite to form only one sulphuret, which consists of—

1 Equivalent of sulphur	= 16
1 " " cadmium	= 56

Equivalent of sulphuret 72

This metal does not readily unite with sulphur when they are heated together. The compound is more easily formed when the oxide is heated with it, but the best method is to precipitate a salt of cadmium with sulphuretted hydrogen. This sulphuret has a yellow colour, inclining to orange. It was this colour which first led to the suspicion that zinc contained arsenic. When heated to redness it becomes brown, and afterwards carmine red, but on cooling it resumes its original colour. It is not decomposed at a high temperature; but a strong white heat melts, and causes it to crystallize on cooling in transparent plates of a fine yellow colour. Concentrated muriatic acid decomposes it with the evolution of sulphuretted hydrogen, and without any deposit of sulphur. Nitric acid converts it into sulphate of cadmium.

Phosphorus and Cadmium combine readily; the resulting phosphuret is grey, has a weak metallic lustre, is brittle, and but slightly fusible. When heated in open vessels it burns with a very bright phosphoric flame, and is converted into phosphate of cadmium. It dissolves in muriatic acid with the evolution of phosphuretted hydrogen gas.

Iodine and Cadmium may be made to combine by treating the metal with iodine, either in the moist or dry way. Iodide of cadmium forms large hexagonal tubular crystals, which are colourless and transparent, have a shining pearly lustre, and do not alter by exposure to the air. This salt is readily soluble both in water, and in alcohol. The crystals fuse readily, losing their water of crystallisation, and again crystallizing. At a higher temperature this salt is decomposed, iodine vapourising, and metallic cadmium being left. It is composed of—

1 Equivalent of iodine	= 126
1 " " cadmium	= 56

Equivalent = 182

Fluorine and Cadmium form a fluoride which is but little soluble in water, but more so when acid is in excess. On evaporating the solution an irregular crust is deposited, which adheres to the vessel. It is composed of—

1 Equivalent of fluorine	= 18
1 " " cadmium	= 56

Equivalent = 74

The various acids combine with oxide of cadmium to form salts, the general properties of which are, that a considerable number of them are soluble in water, and the solutions are in general nearly or quite colourless: the insoluble salts are also commonly devoid of colour. The soluble salts are decomposed by ammonia and the fixed alkalis, they throwing down white hydrate of cadmium, which an excess of ammonia redissolves. The alkaline carbonates precipitate white carbonate of cadmium; sulphuretted hydrogen occasions a yellow deposit; ferrocyanide of potassium a white one, and infusion of galls produces no effect. A plate of zinc throws down metallic cadmium.

Nitrate of Cadmium crystallizes in radiating needles, which attract moisture from the air, and are very soluble in water. This salt consists of—

1 Equivalent of nitric acid	= 54
1 " " oxide of cadmium	= 64
4 " " water	= 36

Equivalent = 154

Carbonate of Cadmium is readily obtained by adding a solution of carbonate of soda to one of nitrate of cadmium. It is a white insipid powder which is insoluble in water. When heated it is decomposed, owing to the expulsion of the carbonic acid. It is constituted of—

1 Equivalent of carbonic acid	= 22
1 " " oxide of cadmium	= 64

Equivalent = 86

Sulphate of Cadmium crystallizes in large transparent prisms, much resembling sulphate of zinc in appearance. This salt readily dissolves in water. It effloresces when exposed to the air, and at a low heat loses its water of crystallization without fusing. The dry salt is not easily decomposed, a low red heat not being sufficient to expel the sulphuric acid; but at a higher temperature it loses part of its sulphuric acid, and becomes a subsulphate. Its constituents are—

1 Equivalent of sulphuric acid	= 40
1 " " oxide of cadmium	= 64
4 " " water	= 36

Equivalent = 140

Acetate of Cadmium crystallizes in fine needles, which are readily soluble in water, and do not alter in the air; they are composed of—

1 Equivalent of acetic acid	= 51
1 " " oxide of cadmium	= 64
2 " " water	= 18

Equivalent = 133

These are the most important crystallizable salts of cadmium; with phosphoric, boracic, oxalic, arsenic, tartaric, and citric acids, oxide of cadmium forms salts which are nearly or quite insoluble in water.

Alloys of Cadmium.—Several metals readily combine with cadmium, and form with it brittle alloys, and when they are strongly heated the cadmium is volatilized.

Copper and Cadmium form a yellowish white brittle alloy, and a small quantity of cadmium is sufficient to produce this effect; 100 parts of copper retain 82.2 of cadmium when exposed to a red heat, but when the alloy is heated to the fusing point of copper the cadmium is volatilized entirely.

Platina and Cadmium yield an alloy which is of a silver white colour, brittle, and not readily fusible; 100 parts of platina retain 117.3 of cadmium at a red heat.

Mercury and Cadmium readily unite, and form a fine argentine amalgam, which crystallizes in octahedrons. The crystals fall to the bottom of the mercury, and are consequently of greater specific gravity. The saturated amalgam is composed of 78.26 of mercury, and 21.74 of cadmium.

Cadmium not having been long discovered, no very great use has been made of it. If larger quantities of it should be obtained, its malleability may render it useful for several purposes. The sulphuret would probably be employed as a pigment, and sulphate of cadmium has been used in medicine as a substitute for that of zinc in collyria, but whether with any advantage over it has not been determined.

CADMIUM, ORES OF. Properly speaking, no ore of this metal has yet been discovered, for it occurs in such

small quantities in the minerals in which it has been detected, that it may rather be considered as an accidental impurity than an essential constituent part. It is thus usually found associated with the ores of zinc, the greatest proportion being found by Stromeyer to be about 3 per cent. in the radiated zinc-blendes of Bohemia. It has also been found by Dr. Clark in the oxides of zinc both of Freiberg and Derbyshire; and its presence may also be generally detected in the common zinc of commerce, and may usually be obtained in considerable quantity mixed with the soot from the crucibles in which the oxides of zinc are reduced by being heated with coal, portions of this substance from the zinc works of Bristol being found to contain from 12 to 20 per cent. of cadmium.

CADMUS, the name of several persons in Greek history. The most famous was the legendary founder of Thebes, who was the son of Agenor, king of the Phœnicians, and was sent in search of his sister Europa, who had been carried off, according to the old fable, by Jupiter under the form of a bull. Cadmus touched at Thera, where he left Memblarius and some of his followers (Herod., iv. 147), and thence proceeded to Bœotia, where, in obedience to the oracle, he formed a settlement on a spot pointed out by a heifer which he had followed, and which lay down by the streams of Dirce. He had, however, in the first place, to kill a fierce dragon who guarded the place, and on sowing the monster's teeth, as he was directed to do, a host of armed men sprung from the ground, and fought with one another till all but seven were slain. These seven joined Cadmus in founding Cadmeia, subsequently the citadel of Thebes; hence the Thebans were called Sparti (sown men). All these legends are given successively in a chorus of Euripides (*Phœniss.* 641—680, and Scholiast.), and various attempts have been made to explain them. Some contend with Herodotus for the Phœnician origin of the traditions, others refer them to Egypt, and one modern scholar has endeavoured to prove that Cadmus was the leader of a Cretan colony. We have given in a former article [*BÆOTIA*] some reasons for believing with Müller that Cadmus was an old Pelasgian god. Indeed, positive evidence has been given that he was identical with Cadmilus, the father of the Cabiri, and that his wife Harmonia was also connected with the Samothracian rites. (Müller's *Orchomenos*, p. 461.) The legend goes on to relate that he and his wife were changed into serpents, and that he retired to Illyria (Pausan. ix. 583), from whence he led a host of barbarians into Greece and sacked Delphi (Herod. v. 61, ix. 43; Eurip. *Bacchæ*, 1333; Niebuhr, *Hist. Rom.*, i. p. 50). To Cadmus is attributed the invention of 17 letters of the Greek alphabet, the remaining 8 having been added by Palamedes and Simonides. (Plin., *Hist. Nat.*, t. vii. c. 36.)

CADMUS, of Miletus, was the first Greek prose writer. He lived towards the end of the seventh or the beginning of the sixth century B.C., and wrote a history, in four books, of the foundation of his native city and the colonization of Ionia, which was epitomized by Bion of Proconnesus. (Clem. Al. Strom., vi. p. 629; Plin., *Hist. Nat.*, vii. 56, v. 29; Isocrates, *περί Ἀντιόχου*.)

CADSAND, or KADZAND. [*ZELAND.*]

CADUCEUS, a staff of laurel or olive, with a representation of two snakes twisted about it. The caduceus was the symbol of Mercury, to whom, according to the fable, it was given by Apollo, in return for the lyre which Mercury had presented to him. It was also the badge of the heralds of ancient Greece; and the name, which is also written Caduceum, is apparently only a corruption of the Greek κερύκειον (kerukeion), herald's staff. In its oldest form it was merely a bough, like the Greek ἰσχυρίον (iskhetérion), and the Roman *supplicia*, twined about with white wool. Afterwards a white or gilded staff, with imitations of foliage and ribands, was substituted for the old rude symbol. These were probably not turned into snakes till a much later age, when that reptile had acquired a mystic character. Many explanations of the caduceus have been attempted by modern scholars; the most plausible is that of Böttiger, who supposes that it was a representation of a peculiar knot (the *nodus Herculis*, Macrobi. i. Saturn., c. 19) used by the Phœnicians in winding up their packages, and thence adopted by them as a means of signifying to the inhabitants of the countries on which they landed their wish to be upon a friendly footing with them; and as the Phœnicians were, generally speaking, the first strangers with whom at old Greece had intercourse, their symbol of amity

probably be used for the same purpose whenever an occasion offered. (Böttiger, *Vasengemälde*, part ii., p. 97, *Amalthea*, vol. i., p. 104—116.)

CÆCILIUS, STATIUS, a Gaul, originally a slave. He received the name of Statius when he became free. He died about one year after his friend Ennius, that is, B.C. 168. Cæcilius wrote thirty comedies in the Latin language, of which only fragments remain in the writings of Cicero, Aulus Gellius, and the grammarians. His merit has been variously estimated by the ancients: Cicero (*de Attic.*, vii. 3) condemns his style as bad; and Quintilian (x. i.) does not assent to the praises which had been bestowed on him by others. Horace (*Epist.* ii. i. 59, *de Art. Poet.* 54), on the contrary, praises him as in some points superior to Plautus and Terence; and Vulgatus Sedigitus (in Aul. Gell. xv. 24) gives him the highest rank in comedy. Many of his plays were imitations of Menander; and Aulus Gellius (ii. 23) says that when he read them separately they appeared rather pleasing and lively, but that when compared with the Greek originals they were perfectly disgusting. In the same very valuable chapter Aulus Gellius gives a scene from the *Plocium* (πλόκιον, *nocturne*) of Cæcilius with the scene of Menander from which it is copied. They differ as much in brightness, he says, as the arms of Diomed and Glaucus. (See Terence, *Hec. Prolog.* 5.)

CAEDMON, the father of English song, or the first person of whom we possess any metrical composition in our vernacular language. This composition is a kind of ode consisting of no more than eighteen lines, celebrating the praises of the Creator. It is preserved in Alfred's translation of Bede. Bede gives the following account of the production of it, and of the author. Caedmon was in some kind of connexion with the monks of Whitby: he seems to have had the care of their cattle. So far from having the gift of song, when he was present at any convivial meeting, and the harp passed round among the guests (it appearing to have been the custom of our Saxon forefathers to amuse themselves with improvisatore descants accompanied by this instrument, as is still practised at meetings of the Welsh bards), when it was approaching him he shrunk away, and would leave the assembly and retire to his own house. One day he had thus departed from a house of mirth, and at night he had himself down and slept. In his sleep some one seemed to say to him, 'Caedmon, sing me something;' he replied, 'I cannot sing;' 'Yet thou must sing to me,' said the voice; 'What shall I sing?' said he; 'Sing me the origin of things.' The subject thus given him, he composed the short ode in question. When he awoke, the words were fast in his mind.

This need not be set down at once as a legendary tale, there being nothing of extreme improbability in it. The effect was that Caedmon became admitted by the Abbess Hilda into the company of the holy men whom she had collected round her in her monastery at Whitby. He continued to receive poetic inspiration, and he composed numerous poems on sacred subjects, which were sung in the abbey for the edification of its inhabitants. Sacred subjects were his delight, and to them he confined himself. He continued in the monastery for the remainder of his life, and there he died, as is conjectured, in the year A.D. 680.

The authenticity of the little poem above mentioned is perhaps unquestionable. But besides this very long Saxon poem, which is a metrical paraphrase of parts of the Scriptures, is attributed to Caedmon. An edition of it was printed at Amsterdam in 1655, under the care of Junius. Hickes expresses doubts whether this poem can be attributed to so early a period as the time of Caedmon. He thinks he perceives certain Dano-Saxonisms in it which would lead him to refer it to a much later period. It has been again printed by Mr. Thorpe as a publication by the Society of Antiquaries, London, 8vo. 1832. Mr. Thorpe is of opinion that it is substantially the work of Caedmon, but with some sophistications of a later period. At all events the poem seems to have been popular, and to have been much used in later times by the makers of the mysteries, which furnished so much of the amusement of our ancestors. An attempt has been made to show that the parts respecting the creation and our first parents had been studied by Milton.

The works to which those persons will have recourse who desire to enter at large into this subject, are the two editions by Junius and Thorpe; Warton's *History of Poetry*; Conybeare's *Illustrations of Anglo-Saxon*

Deary, and the name of the Archæologia, where the very curious illustrations of this poem in the margin of it, the manuscript, is known, at the Bodleian library at Oxford, is believed to be later than the sixteenth century.

CÆLIUS AURELIANUS, the only remaining writer of the sect of the Methodists in medicine, was born at Sicca in Africa. The time when he lived is uncertain; as neither he nor Galen mention each other, it has been supposed that they were contemporaries, while others have thought, from the barbarousness of his style, that he must have lived as late as the fifth century. But his African origin as well as the imperfect education, which, in common with the majority of the Methodists, he probably received, will account for his barbarous Latinity, as well as his blunders in Greek. Thus he translates *σπασμὸς* by *spirandi correctio*, *σάκχα φλεβί* by *venam laxare*, instead of *venam secare*, and derives *πᾶν* from *μολοῖσθαι* because the melancholy love solitude. His work, which consists of eight books, three on acute and five on chronic diseases, is a translation into Latin of the writings of Soranus, a Greek physician, of the time of Hadrian, with additions from his own practice and from other authors.

Cælius Aurelianus appears to have been an observant practitioner, and gives several original cases in medicine as well as surgery. He had seen an instance of *idiopathic hydrophobia*, *i. e.* where the disease did not proceed from the bite of a rabid animal, but arose spontaneously; and mentions the occurrence of hydatids in some kinds of dropsy. He had seen a fit of the gout terminate in apoplexy from the too liberal use of bitter and acrid substances; and among his practical precepts we may cite the recommendation of oil as an injection for the cure of ascarides (thread worms). The medical sect of Methodists held a middle place between the dogmatists and the empirics. The dogmatists maintained that the practice of physic must depend upon the theory, and that he who is ignorant of the origin of diseases cannot treat them with advantage. The empirics, on the other hand, alleged that medicine depends on experience alone, and that the physician, like the husbandman or the steersman, is formed by practice, not by discussion. The former sect studied anatomy, the latter neglected it. (Celsus, *de Med.* lib. 1.) The Methodists combined something of the theoretical turn of the dogmatics with the practical simplicity of the empirics, but it must be owned that they carried this simplicity too far. Thus Themison, their founder, 'reduced all diseases to three kinds only, the *strictum*, the *laxum*, and the *mixtum*; the last consisting of the *strictum* in one part of the body, and of the *laxum* in another. He maintained that it was enough to refer any particular disease to one or other of these three heads, in order to form the proper indications of cure. This easy plan was, by way of eminence, called the Method, and the persons who followed it the Methodics.' (Cullen, *Introduction to Lectures, — History of Medicine.*)

With them, as with others, theory sometimes succeeded in stifling the best-established practice. Thus the Methodists, not satisfied with banishing specifics from the practice of physic, declared war even against purgatives, which are of more general utility. These remedies had been denounced by Chrysippus, Erasistratus, Asclepiades, and Themison. Cælius agrees with them, and after having blamed Heracleus the empiric, who purged phrenetic patients without intermission, he asks him, 'Where do you think the crudity comes from, which you imagine you expel by your purgatives? If you say it is in the intestines, a clyster will suffice. If it is in the head, or in the whole body? You answer, and leave it uncertain. This is a proof that you trust to the good conduct of your medicine, and believe that it acts like an intelligent animal, discerning what is corrupt, in what is not, and expelling the former, but not the latter.' As the philosopher of old who denied motion was answered by one who walked across the room, so these ingenious speculations are to be refuted by the multitude of cures effected by remedies which are theoretically maintained to be injurious. On the whole, however, Cælius Aurelianus is a writer of the second class of medical writers, those who, though not great discoverers, yet had a great facility, with useful additions, the rich inheritance of experience which they have received.

The first of these writers is Aulus Cornelius Celsus, who lived about the year 100 B.C. He was a Roman, and his work, which is a treatise on medicine, is one of the most valuable of the kind. It is divided into eight books, and contains a great deal of information on the history of medicine, and on the practice of physic. It is a work of great value, and is one of the most important of the medical literature of the ancient world. It is a work of great value, and is one of the most important of the medical literature of the ancient world. It is a work of great value, and is one of the most important of the medical literature of the ancient world.

John the

books of Cælius Aurelianus, 16.

Alia, 16. This edition (in which Cælius Aurelianus is joined with other writers) contains only the five books on chronic diseases. There is a complete edition by Dalechamp with marginal notes, Lyons, 1567, 8vo. The best edition is that of Alimovici, Amsterdam, 1722 and 1755. (*Essai d'une Histoire pragmatique de Médecine par Kurt Sprengel, traduit par Boiger*, tom. ii. p. 42, et seq.; *Le Clerc Histoire de la Médecine*, Amsterdam, 1702, *Seconde Partie*, p. 188, et seq.)

CÆLUM SCALPTORIS, the sculptor's tool, a constellation of Lacaille. It is situated below Columba Noachii and Canis Major, low enough now to rise in this country.

CÆN, a city in the north of France, in the department of Calvados, on the banks of the river Orne, at the confluence of the Odon with that river: 121 miles in a direct line W. by N. of Paris, or 134 miles by the road through Mans, Evreux, and Lisieux; in 49° 11' N. lat. and 0° 23' W. long.

Cæn does not appear to have existed in the time of the Romans, at least it is not mentioned by any of the Latin writers; but conjecture, in the absence of testimony, has ascribed its foundation to Phœnicians, Romans, Gauls, Saxons, and Normans. William de Talleur de Rouen, the author of an old Norman chronicle written in the fifteenth century, makes it one of the good towns of Normandy in the middle of the tenth century. Early in the eleventh century it is described in a charter of Richard Duke of Normandie as possessing churches, a market, a custom-house and a quay. In this charter the town is called Cathim; from Cathim was derived Cahem, and from this again Cæn. In the Latin of the monkish historians the name is Cadomus or Cadomum.

Just before the conquest of England by the Normans Cæn appears to have been an open town. Huet, bishop of Avranches, considers that the first fortress was built here by William the Conqueror, who frequently made this place his residence. Here that prince and his queen Matilda built respectively the abbeys of St. Etienne (St. Stephen) and the Holy Trinity. In the church of the abbey of St. Etienne the body of William was interred.

In the transactions of the duchy of Normandy Cæn took little share, but it appears as a place of importance in the wars of the English in France, under Edward III. and the princes of the house of Lancaster. In 1346, just after it had been walled in, it was besieged by Edward III., who had landed at La Hogue with his son the Black Prince. The town was, as Froissart tells us, 'large, strong, and full of drapery and all other sorts of merchandise, rich citizens, noble dames and damsels, and fine churches.' The constable of France and several other nobles commanded the garrison; but their efforts were rendered unavailing by the rashness of the citizens, who, confiding in their numbers, demanded to be led out against the enemy. They were defeated; the conquerors entered the town pell-mell with the vanquished; the place was plundered; and the English fleet returned home loaded with rich merchandise and several prisoners. In 1417 Cæn was again taken by assault by the English, and was given up to indiscriminate plunder, not even the churches escaping the ravages of war. The town remained in the possession of the conquerors till 1450, when it was reannexed to the crown of France by the Count of Dunois, to whom it capitulated after a gallant resistance; and since that time it has never been in foreign hands.

In 1512 a dreadful affray took place in Cæn, occasioned by the disorderly conduct of some German lansquenets, who, to the number of 6000, Louis XII. had placed here in garrison: 300 of the Germans fell in the tumult; the men is unknown. In the course of the town suffered from the religious wars.

which arose in France: it was red by the Calvinists, into whose hands it fell; and much of what was saved from their violence was taken by the Catholics, under the pretext of putting it in a place of security.

Caen is situated in a level tract, almost wholly consisting of unenclosed fields of buck-wheat and other corn, extending with monotonous continuity as far as the eye can reach. The appearance of the town from a distance is grand, both from its extent and the number of towers and spires that rise from it. The streets are wide and the houses are built of stone. It is intersected in various directions by the branches, natural and artificial, of the Odon, the banks of which are in many places formed into walks, and adorned by avenues of noble trees. The *grand cours* is almost as fine a promenade as the *grand cours* of Rouen. There are some ancient houses with the gable to the street, and presenting on the front elaborate carvings of wood. They resemble in their general character the older houses in the city of Chester and elsewhere. The town has few fountains, the want of which is supplied by wells. The *Place Royale* is a large and regular square, and the public edifices are numerous and striking. There have been considerable improvements of late years in the outskirts of the town, which are facilitated by the circumstance of stone being quarried in the immediate neighbourhood. There are but slight remains of the ancient walls and towers by which the town was defended.

The public buildings of Caen are interesting as the relics of former ages. The castle, said to have been built by William the Conqueror, enlarged by Henry I. of England, and much altered at a subsequent date by the French kings, still claims to be ranked as a place of defence, though it retains few of its original features. The towers which flanked the ramparts have been brought down to the level of the platform, and the donjon tower has been destroyed; but though the castle has suffered these mutilations, the extent of its site, the thickness of its walls, and the width of its ditches, testify its original importance. Another castellated building called the *Château de Calix*, at the extremity of the suburb of Calix, is adorned with several medallion-busts in low relief carved in stone on the walls: there are also on the battlements two stone figures of such doubtful character, that while Mr. Dawson Turner supposes them to be Neptune or some other sea-god and Hercules, the common people regard them as *gens d'armes* mounting guard on the castle, which is often called from them the *Château de Gendarmerie*. This building is probably not older than the beginning of the 16th century.

Among the chief ornaments of the town are the two royal abbeys. The monastic buildings of the abbey of St. Etienne are now appropriated to the use of the *collège* or high school. The church is magnificent: the eastern end, with its wide semicircular sweep and slender turrets, approaches to the character of an oriental mosque; the western front is divided by buttresses into three parts, the outer two of which rise into towers, and are surmounted with lofty octagon spires. The central tower of this church was undermined and much injured by the Huguenots: it is surmounted by a short conical spire or roof. The tomb and coffin of William the Conqueror were broken open by the Huguenots in 1562, and the bones dispersed and lost except one, which also was afterwards removed. An ancient building, now in ruins, in the precincts of the abbey, is called the palace of William the Conqueror, though of a later date than his time; and it may be questioned if it was ever a royal palace at all. The monastic buildings of the abbey of the Holy Trinity (for nuns) are modern: the church, now used as an hospital or workhouse for the department of Calvados*, is one of the noblest specimens extant of the solid grandeur of Norman architecture: the west front, though deprived of the lofty spires with which its towers were surmounted, far exceeds that of the rival abbey of St. Etienne. This abbey in the middle ages united the seemingly incongruous characters of a nunnery and a fortress. Of the parish churches, that of *St. Etienne le Vieil* has on the wall of its choir an equestrian figure of very disputable date, supposed to be part of a group representing the entry of William the Conqueror into Caen: the church of St. Pierre is remarkable for a light, elegant, symmetrical tower and spire erected in 1308, and ha-

inferior in elevation to those of Salisbury cathedral. The church of St. Nicholas, built by William the Conqueror about A.D. 1060, is now used as a stable.

The population of Caen by the census of 1832 was 37,019, the town or 35,140 of the whole commune. The town the centre of a rich agriculture and a considerable inland trade: it is a manufacturing town and a port. The union of the Odon with the *Orne* forms a stream capable of bearing at high tides vessels of 200 tons, but ordinarily it admits only much smaller ones. Many plans have been suggested for the improvement of the port; and Napoleon, following a suggestion made long since by Vauban, desired to make it a naval station. The ramifications of the Odon offer great advantages for mills and manufactories. Hosiery, cotton yarn, calico, and other woven goods are manufactured here; there is a considerable sugar-refining house, and many oil-mills; and paper-hangings are made. But the chief article of manufacture is *linen*; the streets are lined almost uninterruptedly with *linen* and boys engaged in this branch of industry, and it is calculated that 20,000 persons in and about Caen are engaged in the production of this article, which is in high estimation for its beauty and quality, and is exported in considerable quantity.

Caen has an *Académie* or University, the first establishment of which is due to the English. Henry II. of England, or rather John Duke of Bedford (then regent of Normandy) in his name, founded a college in 1431, which was subsequently enlarged in its plan and sanctioned by the bulls of Pope Eugenius IV. Upon the conquest of the province by the French this university was dissolved (A.D. 1450) with a view to the founding of a new one by the French king; but the old one was re-established and replaced on its original footing in 1452. In the estimation of the inhabitants the university of Caen now holds the third place in France, those of Paris and Strasburg being the only ones allowed to surpass it. There is a *collège* or high school, a school of medicine, one of drawing and architecture, and one of navigation, geometry, and mechanics applied to the arts. The Academy of Arts, Sciences, and Belles Lettres, the Society of the Antiquaries of Normandy, the Linnean Society, and the Central Society of Agriculture, present the elements of a Provincial Institute, the formation of which is suggested by M. Dupin. There are a good public library of 40,000 volumes, a museum of natural history, a botanic garden, a collection of paintings. The town has produced several men of literary eminence; among them are Malherbe, Segrais, and Huet, bishop of Avranches.

The chief charitable establishments of Caen are the hospital of the abbey of the Holy Trinity (or, as it is generally called, the Abbey aux Dames), remarkable for the space allowed to every patient, the exquisite neatness of the several departments, and the general excellence of its arrangements; and the establishment of *Le Bon Sauveteur*, comprehending a lunatic asylum for both sexes, a dispensary, a deaf and dumb school, a free-school for 120 poor girls, and other establishments.

Caen is the capital of the department, and the seat of a *Cour Royale* or assize court. The arrondissement of Caen had in 1832 a population of 135,502.

CAERLAVEROCH. [DUMFRIESSHIRE.]

CAERLEON, now an inconsiderable town in the parish of Llangattoch, with a population in 1831 amounting to only 1071, is stated to have once been the capital of Wales. It stands on the river Usk in Monmouthshire and was the *Isea Silurum*, one of the oldest Roman stations in Britain. A description of the place by Gildas Cambrianus, in the twelfth century, gives a lively picture of its former importance. It was the seat of an archbishop soon after the introduction of Christianity into Great Britain. The remains of its former importance are extremely scanty, and the chief part of the site of the ancient city is now covered with fields and orchards. A space of ground, which it is believed was a Roman amphitheatre, is commonly called Arthur's Round Table. There was formerly an abbey of Cistercian monks at Caerleon. The parish is within the diocese of Llandaff, and the living and rectory of the church are valued at £102. The population of the whole parish is 1362. There is a school at Caerleon, founded by St. William, in which fifty boys and girls are instructed. In the time of the Romans smelting works were carried on in the neighbourhood, and there are at present both iron and tin mines. The population does not appear to have increased. MARTIN, or, in Welsh, CAER FYRDDYN,

* We state this on the authority of Mr. Dawson Turner, in his book on the Calvados; he mentions that it was expected soon to revert to its original destination of public worship.

the capital of the county to which it gives name, is 218 miles W. or W. by N. of London, through Oxford, Gloucester, Ross, Monmouth, Abergavenny, Brecon, and Llandovery, or about 190 miles direct distance; in 51° 51' N. lat. 4° 19' W. long. It is on the north-western bank of the river Towy, or Tywi, near where that river bends to the south to empty itself into Caer then is a borough and county of itself.

The name of Caermarthen enables us to identify it with the *Maridunum* (*Mapidunum*) of Ptolemy, one of the towns of the Demetæ (*Δημητῆς*) who inhabited the western part of South Wales. In the time of Julius Frontinus, A.D. 70, a Roman station is said to have been founded here, the site of which is supposed to be that subsequently occupied by the castle and its remains. The form of the camp is still marked by vestiges of stone and earthworks. The remains of another camp, supposed to have been the *Castra æstiva*, or summer military station, are still visible in a field on the northern side of the town, and several other vestiges of the Roman occupation have been discovered. It was afterwards the residence of the prince of South Wales. At what time the castle of Caermarthen was erected is not known; but in the contests between the neighbouring Welsh chieftains for the possession of the district, and in the wars between the natives and the Anglo-Saxons and Normans, it was a post of importance, and frequently changed hands; in these struggles it suffered much. In the time of Charles I. the castle was garrisoned by the Royalists, from whom it was taken by the Parliamentarians under General Langhorne, or Laugharne. It was probably dismantled shortly afterwards, and allowed to go to decay; part of it was, however, occupied as the county gaol till towards the close of the last century.

The situation of this town is very beautiful, and the inequality of the ground on which it stands gives it a striking appearance when viewed from a distance. But the streets are irregular and steep, and many of them narrow; the principal streets however are well paved, and lighted with gas. The houses are in general whitened, but have chimneys of red brick. The principal edifice is the guildhall in the centre of the town, a large and handsome modern building, raised on pillars, with a covered market underneath. The county gaol occupies part of the site of the castle. This castle was on the brow of a hill rising abruptly from the river; the remains of it, if indeed any exist, are inconsiderable at the present time. There is a good market-place out of the town; and a substantial bridge of several arches over the Towy, by which the road from Swansea enters the town. Though Caermarthen formerly had several parishes, there is now but one. The church, dedicated to St. Peter, is a plain large building, with a square tower. Sir Richard Steele lies buried here, but has no monumental record. The living is a vicarage, formerly in the patronage of the crown, now of the college at Lampeter. There are some remains of the old church of St. Mary, not used for religious purposes since the dissolution of the monasteries, and of two religious houses, a priory of the canons of St. Austin, and a house of Franciscan or Grey Friars.

The population of Caermarthen in 1801 was 5548, but this return has been asserted to be incorrect. In 1831 there were 9953 inhabitants in the parish, of whom 2182 were males of twenty years of age. Of these 2182, 196, or less than one-tenth, were engaged in agriculture; 1079, or nearly one-half, in manufactures, making machinery, in retail trade, or handicraft. There are no manufactures of any consequence, except some iron and tin works in the neighbourhood, but the trade of the place is considerable. The quay extends along the banks of the Towy, and was till lately accessible at spring tides to vessels of 300 tons. The vessels which come to Caermarthen are chiefly coasters: the communication with Bristol is great. Vessels from 50 to 150 tons are built here. The town furnishes the populous district with which it is surrounded with various commodities. Among the exports are timber, bark, marble, slates, leather, tallow, grain, butter, and eggs. There is a larger proportion than usual of wealthy persons among the shopkeepers and merchants. The market days are Wednesday, Friday, and Saturday; that on Saturday is the chief corn market, that on Friday is for fish. There are several inns in the town.

Caermarthen has several dissenting meeting-houses. There is a grammar-school, endowed by Dr. Owen of St. David's, in the seventeenth century. The scholars of

this school were admitted to holy orders without having to attend the universities before the establishment of the college at Lampeter. There is a Presbyterian college for the education of young men for the ministry; and there are also Baptist, Wesleyan, National, and Sunday schools.

The corporation of Caermarthen was probably established by Edward I.; the governing master was granted by George III. in 1764. The mayor, recorder, and town-clerk hold a court fortnight the business of which is, by custom, chiefly confined to the recovery of debts. There are two general sessions for the town; three of the quarter sessions for the county are held here, and also the assizes. This borough has returned one member to parliament since the time of Henry VIII. Llanelli shares this privilege with it since the passing of the Reform Act.

The county of the borough of Caermarthen includes the parish of Llanllwch, a perpetual curacy in the patronage of the vicar of St. Peter's church in Caermarthen. Among its corporate officers were two sheriffs, annually elected; but in future, it seems, Caermarthen will have only one sheriff, according to § 61 of the Municipal Corporation Act.

Caermarthen gives the title of marquis to the family of Osborne.

CAERMARTHENSHIRE, a county of South Wales, situated in the western part of that principality, lies between 51° 41' and 52° 9' N. lat., 3° 36' and 4° 47' W. long. It is bounded on the N. by Cardiganshire, on the E. by Brecknockshire, on the S. E. by Glamorganshire, on the S. W. by the sea, and on the W. by Pembrokeshire. Its greatest length is 5.3 miles, measured E. N. E. and W. S. W. from Egreffont on the border of Pembrokeshire to the neighbourhood of Llandulas in Brecknockshire; its greatest breadth, measured at right angles to the above, is about 3.3 miles, from the junction of the Keach with the Teify to a promontory S. of Llanelli.

The area of the county is not given in the population returns. Mr. Arrowsmith states it in his large map of England and Wales at 97.4 miles (623,360 acres), which may be considered as near the truth. It is the largest of all the Welsh counties. The population in 1831 was 108,740.

Surface, Hydrography, Communications.—Caermarthenshire partakes of the mountainous character which is general in Wales, but the elevation of the mountains is not so great as in some other counties. In the northern part of the county a range, distinguished in its different parts by the names of Carreg Wen, Mynydd Castell Newydd, Mynydd Talit Wals, New Inn Hill, Llanybyther Mountain, and Pen Carreg Mountain, runs nearly parallel to the boundary between this county and Cardiganshire, about four miles within the county. This range separates the vale of the Teify from that of the Cothy, a feeder of the Towy. The highest point is probably New Inn Hill, 1168 feet above sea level of the sea. Nearly parallel to this range, but more to the south-east, is another smaller range (Y Graig Ddy and Van Lansadum), separating the valley of the Cothy from that of the Towy. To the south-east of the last river we have Pembrey Mountain, Bien y Gors Mountain, Llanion Hill (912 feet), and the range of the Mynydd Du, or Black Mountains, of which the highest point, Caermarthenshire Vann, more correctly Y Fan or Ban Sir Gaer (the Caermarthenshire Beacon), has an elevation of 2596 feet. Besides these there are to the N. E. Talsarn and Treacastle Mountains, and several detached eminences.

The principal river of Caermarthenshire is the Tywi or Towy, which rises in Cardiganshire in a large morass near upon the border towards Brecknockshire; flowing southward, and receiving the waters of many brooks, it enters Caermarthenshire near the north-eastern extremity of the county. It continues its course southward until it reaches the neighbourhood of Llandovery, near which it receives the united stream of the rivers Braen and Gwydderig, or Withrig, which latter rises in Brecknockshire and flows nearly in a western direction. The Towy, thus augmented, runs a tolerably direct course to the S. W. past Llangadock and Llandilo-vawr, watering a valley bounded by the mountains already described, the Y Graig Ddy and Van Lansadum on the one hand, and the Mynydd Du, or Black Mountains, with their branches on the other, and receiving many small feeders on each bank. Below Llandilo-vawr the Towy bends more to the W. and flows to Caermarthen, where it takes place at Grongar Hill, celebrated by the poet Dydd. Between Llandilo-vawr and Caer-

marthen, the Towy receives the waters of the Cofhy or Gofhy, the most important of its feeders, and the waters of several other streams. From Caermarthen the river flows southward into the bay of Caermarthen, its estuary being combined with those of the Gwendraeth Vawr and the Tawe. The whole course of the Towy is about 30 miles, of which about 50 miles are in the county of Caermarthien. The navigable part, which does not appear and above Caermarthen town, is about eight or nine miles. This river abounds with fish, especially salmon, sewin, trout, and eels; anprey and lamprey in the months of June and July. It affords great diversity and beauty of scenery. Its banks are in many places well wooded. The Cofhy rises on the border of the county towards Cardiganshire and has a S.W. course of about 25 miles before its junction with the Towy.

The Tawe rises in Pembrokeshire, east of Pwllheli Mountain, but has only a small part of its course in that county. It flows first to the S.W. then to the S. and then to the S.E. The valley through which it flows is well wooded. It does not receive any considerable feeders until it reaches the village of St. Clears, at or below which it receives the Cawgenny and the Cowin or Cowen, which rise in the hills in the north of Caermarthenshire, and flow due south. The Tawe becomes navigable at St. Clears, and flows into Caermarthen Bay just below the town of Laugharne its whole course is about 26 or 28 miles.

The Gwendraeth Vawr (or Great Gwendraeth) rises in the hills which occupy the S.E. part of the county towards Glamorganshire, and flows S.W. into Caermarthen Bay. The mouth is much obstructed by the sand, which has its accumulation, formed a dangerous bar, much to the injury of the trade of Kidwelly. Its course is only about 15 miles.

The Loughor rises in the Mynydd Dû or Black Mountains, and flowing S.W. forms, during the greater part of its course, the boundary between Caermarthenshire and Glamorganshire. It is a very copious stream from its source, near which it has a fall of eighteen feet; and it receives several tributaries. Its estuary has the name of the river Burry. It is navigable to above Loughor, which is on the Glamorganshire side. Its length, from its source to the place where the estuary opens into Caermarthen bay, is about 28 miles. It has been supposed that the Loughor really issues from a lake near the Caermarthenshire Vann; and the supposition was confirmed by the circumstance that some husks of corn thrown into the lake reappeared six hours afterwards at the apparent source of this river. The Teify divides this county from Cardiganshire.

There are no lakes of any extent in Caermarthenshire. One on Mynydd Mawr (the great mountain) which overlooks the valley of the Towy is of circular form, about half a mile across, and abounds in fine perch and other fish. Another lake of very lumpy water lies at the foot of the steep declivity of the Caermarthenshire Vann: it is remarkable for the beauty of the scenery by which it is surrounded. Its greatest depth is sixteen fathoms, and its greatest diameter about a mile: it abounds with fine perch and eels of extraordinary size. It is the source of the Sawddy, a feeder of the Towy.

There are properly only two navigable rivers in the county, the Towy and the Tawe: the navigation of the Loughor and the Gwendraeth Vawr is confined in reality to their estuaries. There is one short canal, from Kidwelly to Llanelli, with a cut to Pembrey Harbour; one (the Caermarthenshire) railway, sixteen miles long from the limestone quarries of Castell y Garreg to Llanelli, where is a small dock for shipping; and another (the Llanelli) railway, little more than two miles long, with a dock or basin at its termination at Machynis pool near Llanelli. These railroads are chiefly designed for conveying the mineral produce of the country to the sea.

Caermarthenshire is intersected in almost every direction by turnpike-roads. Two mail-roads, both leading to Haverfordwest and Milford, cross the county: one passes through Oxford, Gloucester, and Brecon, enters Caermarthenshire between Treacastle and Llandovery, and runs by Llandovery to Caermarthen; the other through Bath, Bristol, Cowbridge, and Neath, enters Caermarthenshire near Pontarddylan and runs to Caermarthen. This road is the chief communication between Swansea and Caermarthen. From Caermarthen, where these two roads unite, they run by St. Clears and Tavernspice into Pembrokeshire. From Caermarthen a turnpike-road runs N.W. to

New Castle Emlyn and Cardigan; and another N.E. to Lampeter. There are roads from Llandilovawr and from Llandovery to Lampeter; from Llandovery to Builth and New Radnor; from Llandilovawr, by Llangadock, to Treacastle, and from Llandilovawr southward to Bettws, and from thence to various parts of Glamorganshire.

Geological character. The southern part of the county bordering upon Glamorganshire and the sea forms part of the great coal-field of South Wales, the most extensive of the coal-fields of Great Britain, though yet comparatively little worked. The coal is chiefly what is called stone coal: the large coal of this quality is used for drying hops and malt; the small coal called culm, for burning limestone. Towards the coast the coal is more bituminous. Culm constitutes the principal fuel of the district: it is mixed with clay till it acquires the consistence of mortar, and is then formed into balls of a moderate size, which are piled in the grate and give out a strong heat. Iron-stone is procured from the coal-measures near Llanelli, and considerable iron-works. The coal-field of Llanelli lies in a basin of mountain or carboniferous limestone, and the northern outcrop of this limestone crosses Caermarthenshire in a waving line E. and W. It forms the coast just at the northern part of Caermarthen bay, which divides the coal-field into two parts, separating that which is in Pembrokeshire from that in Caermarthen and Glamorgan shires. From this belt of limestone the farmers of this county obtain their lime for manure. Some marble of a blue colour slightly veined with white, which bears an excellent polish, is quarried in it: it is wrought into chimney-pieces and sent to Bristol. The tombstones in all the neighbourhood are made of it.

The old red sandstone, which rises from beneath the mountain limestone, occupies in the county only a comparatively narrow strip of the surface bounding the coal-field and the limestone district to the north. It widens indeed as it approaches Brecknockshire, where it spreads out so as to occupy the chief part of that county. The Towy above Caermarthen flows near the boundary of the Sandstone belt. Clay slate and grauwacké slate underlie the sandstone, and rising from beneath it occupy the rest of this county, and also those of Cardigan, Montgomery, Radnor, and part of Salop. (Conybeare and Phillips's *Geology of England and Wales*; *Requisites of England and Wales*; Greenough's *Geological Map*; Walker's do.)

Divisions, Towns, &c. Gough, in his additions to Camden, says that Caermarthenshire contains six hundreds; but this is not correct. There are altogether eight hundreds, viz., Cathinog and Cayo in the N., Perfedd in the E., Iskennen in the S.E., Carnwallon and Kidwelly in the S., Derllys in the W. and S.W., and Elvet in the N.W. The three hundreds of Iskennen, Carnwallon, and Kidwelly form a district distinct from the rest of the county, having a corner of its own.

There are in this county one borough, Caermarthen (population 9955), with its contributory borough Llanelli, six market-towns, besides the two already mentioned; Kidwelly, Laugharne, Llandilovawr, Llandovery, Llangadock, and Newcastle Emlyn.

Llanelli is situated upon the river Burry, the estuary of the Loughor; it is little more than ten miles from Swansea by Loughor Ferry. It is irregularly built, but some of the houses are tolerably good. The church, dedicated to St. Elhw, is an irregular edifice with two steeples, one terminated by a spire, the other by an embattled turret.

The population of the principal hamlet (Borough) is 4173; the town and the parish church are in this: the other four hamlets of Berwick, Glyn, Hengoed, and Westfa or Westosc, well the population of the whole parish to 7646. Llanelli is mentioned as a borough town in the reign of Edward II. It is flourishing, and has an increasing trade. The collieries employ 500 persons; the coal, which is of fine quality, is exported to France and to the Mediterranean for steam-boats. There are some copper works: the ore is imported, and the copper cakes and sheathing exported. There are two iron foundries, but neither of them of much importance. There are three docks for shipping, and a fourth in course of construction. A canal and tram road enable Llanelli to communicate with Kidwelly.

There was before the Reformation a chapel in each of the five hamlets. There are now several dissenting meeting-houses, and several free-schools. Near the town is an ancient camp supposed to be British.

Kidwelly or Cydweli, a borough, is upon the Gwendraeth Vechan, or lesser Gwendraeth, at its junction with the Gwendraeth Vawr. It is divided into two townships, New Kidwelly, on the eastern or left bank of the river, and Old Kidwelly on the western bank, surrounded with walls, and had its gates: one of these is yet standing. This town is decayed, the situation of New Kidwelly being found convenient. The trade however of the whole declined, owing to the sand obstructing the navigation of the river. The church, dedicated to the Virgin Mary, is in the new town, and is an antique structure, very high, containing an aisle, and two ruined transepts: there is a tower at the western end surmounted by a spire 165 feet in height. There is a good stone bridge over the Gwendraeth Vechan. The ancient castle occupies a rocky eminence on the western side of the Gwendraeth Vechan: its external appearance is grand and imposing; it is on the whole in good preservation, several of the apartments being entire, with their arched roofs yet unimpaired, and the staircases being in tolerable condition. The magnificent gateway toward the west, which formed the principal entrance, is also yet standing. The ground plan of this castle was nearly square, with a large tower at each corner, and several other towers of smaller dimensions. This fortress is said to have been built about the close of the eleventh century by a Norman knight who had assisted in the conquest of Glamorganshire. There is a free-school, the master of which has a small salary from the corporation. The living is a vicarage in the gift of the king. Leland mentions a cell of black monks of Sherburne as being here in his time; there are some slight remains of this or some other religious house. Kidwelly has several dissenting meeting-houses.

Laugharne is on the right or S.W. bank of the estuary of the Tawe. It is about three miles to the left of the road from London to Milford, turning off at St. Clear's bridge), 12½ miles from Caermarthen. The town is built on the edge of a marsh, open to the sea, and backed by high grounds: it is of small extent, but contains a considerable proportion of respectable houses. The parish church, dedicated to St. Martin, is large and handsome, and with the church-yard (which is on a declivity, affording a rich view from the upper part) adds greatly to the beauty of this sequestered place. The castle of Laugharne is a very picturesque and noble ruin. When Mr. Malkin visited it in 1803 the proprietor had laid out the inner court as a garden, and filled one of the towers with evergreens and flowering shrubs. It was probably built by some of the Norman lords who invaded this coast soon after the conquest: it was an object of frequent hostility in the wars between the Welsh and the English, and was again contested in the war between Charles I. and the parliament. There are also the remains of a building called Roche's Castle, but supposed to have been really a monastery. Laugharne is well supplied with provisions. So late as the commencement of the present century it was divided into two parts, inhabited respectively by the English and Welsh, who neither mixed together nor even understood each other's language. In 1831 the population of the town was 1423; of the whole parish, 2020. The ancient name of this place was Aber Coran (*i. e.*, Coran-mouth), from the Coran or Cowin, which joins the Tawe just above it: afterwards it was called Llacharn (or Tâl Llacharn, *i. e.*, 'above the great lake') from which the present name has been by corruption derived. The town of Laugharne is incorporated. The trade of the place, which consists chiefly of the export of butter and corn, is considerable. There are several dissenting places of worship, and some small endowments for education and other charitable purposes. This town was the birthplace of an eminent political and theological writer, Dean Tucker, who died in 1799, aged 87.

Llandilo-vawr, or, as it is usually called, Llandilo, is on the right or N. bank of the Towy, and on the high road through Brecon to Caermarthen and Milford; 15 miles from Caermarthen. The town is delightfully situated, but has little attraction in itself, though considerable improvements have been made: the houses, except those of modern erection, are generally mean, the streets irregular, and the bridge, though not of ancient date, inconveniently narrow. The church, in the centre of the town, is dedicated to St. Teilo, from whom the town gets its name (Llan-deilo-vawr or fawr, the church of Teilo the great): it consists of two aisles. The market of this town

is considerable: it is held on Saturday: there are eight annual fairs. The quarter sessions are held here once in the year. The living is a vicarage in the gift of the bishop of St. David's: the parish, which is very extensive, extends from N. to S. and eight miles. It is subdivided into a town and liberty of Llandilo-vawr (population 1268), and the hamlets or chapels of Bryn-geirdd (pop. 379), Clynammon (pop. 227), Cy-mawrddwyd (pop. 179), Maner-fabon (pop. 402), Upper Maner-fabon (pop. 323), Lower Maner-fabon (pop. 352), Pent-y-fryn (pop. 206), Tachlan and Rhewlas (pop. 221), and Llan-faris (pop. 207). There are (pop. 379); Trecast (pop. 320); and Trecast and Rhos-naen (pop. 636); pop. of the whole parish, 5149. There are several dissenting places of worship in the parish, and a small endowed school. Leather and some woolsens for home consumption are made in the parish.

Within a short distance of this town on an eminence overlooking the Towy stands the ancient castle of Dynevor or Dinas-fawr, celebrated as the residence of the ancient princes of South Wales: the remains consist chiefly of two towers, one round, the other square, and the walls surrounding an irregular area. Newton House, the present mansion of Lord Dynevor, is at some distance from the castle in a secluded part of the grounds. Four miles S.E. of the town are the remains of Craig Cenen or Carreg Cenen Castell, on the river Cennen or Kennen. This ruin is considerable, several towers and the remains of several apartments: the date of its origin has much disputed. Not far from this is Llanduvaln, a spring once much resorted to on account of its supposed medicinal qualities.

Before the passing of the Reform Act Llandilo-vawr was the place of election for the county members: it is now only a polling place.

The borough Llandovery is on the Braen, a feeder of the Towy, near the junction of the two, as well as to the junction of the Gwthrigh or Gwydder with the Braen. It is on the road from London to Caermarthen, 27 miles from Caermarthen. The town is pleasantly situated, and has considerably improved of late years. It is in the parish of Llandingat, or Llandingat, the church of which stands in the middle of the town: the name Llandovery is a corruption of the Welsh designation Llan-ym Dyffri-br-Ddyffied, the church among the waters, an allusion to the situation of this church near the three rivers mentioned above. The church has no architectural beauty. There are two bridges over the Towy near the town: one a stone bridge of one arch, the other, begun in 1832, a suspension-bridge. There are several dissenting meeting-houses in the town; that of the Independents is very large. There are a national school, an infant school, and several Sunday schools. The population of Llandovery in 1831 was 1700; that of the whole parish of Llandingat 2465. The market on Saturday is well attended. There are six annual fairs. Llandovery was formerly a contributory borough to Caermarthen.

The living of Llandingat is a vicarage, with the chapelry of Llan Fair y Brynn annexed; and is in the gift of the bishop of St. David's. This living was held above two hundred years since by the Rev. Rees Prichard, known as the vicar of Llandovery, and author of a very popular collection of religious poems, called 'Canwyll y Cymry' ('The Welshman's Candle'), but more generally known as 'Llyfr y Ficer' ('the Vicar's Book'): it is the companion to the Bible in almost every Welsh cottage. An endowment left by Mr. Prichard for the maintenance of a free-school has been by some means lost, and the property has reverted to his descendants.

There is supposed to have been a Roman station in the immediate neighbourhood of Llandovery, at Llan-fair y Brynn; and the supposition has been confirmed by the discovery of several Roman antiquities; but the rise of the town of Llandovery is rather to be ascribed to the erection of its castle, which it is likely was built by some of the Norman barons who invaded the country soon after the conquest. The castle was ruined during the civil wars of the 17th century. There are some remains of it on a hill on the west side of the Braen, consisting of part of the keep and some outworks.

Llangadock, or Llan Gadog Fawr, is in the vale of Towy, near the junction of the Sawddy with that river. It is just to the right of a branch-road leading from Trecastle to

the vale of Dynevor, and even a part of the town of Llandovery, are of Llandovery: population 34.

Llandilo-vawr, about 8½ miles from Llandilo-vawr. It is in a delightful situation, and has a very respectable appearance, several of the houses being good buildings. The church is an old and substantial edifice. There is a model bridge of five arches over the Towy. There are several dissenting meeting-houses. There was once a baronial castle here, but no part of it now exists. The population of the parish in 1831 was 2476. Coal and lime are found in the neighbourhood. The coal is sent partly by canal to Swansea, and exported from thence. The living is a vicarage in the gift of the bishop of St. David's. The church is dedicated to St. Cadogan, whence the name of the town is derived.

Newcastle Emlyn is so united with the borough of Adpar in Cardiganshire, that they are usually considered as one town, and both are commonly included under the name of Newcastle. They stand on the banks of the Teify or Teivi; Newcastle on the left or south bank, and Adpar on the right bank, and form an irregular street nearly a mile long. The houses are in general well built. There is no particular trade carried on in the place; but it forms a centre for the sale of cattle for the English market; and in the spring the sea-side barley of Cardiganshire, which is in high repute, is sold here for seed. Stone coal and culm are brought by land from the southern part of the county of Caermarthen, and bituminous coal from Cardigan, to which it is brought by sea. There are eleven cattle-fairs in the year. (*Boundary Reports*.)

Newcastle is 222 miles from London, through Llandovery and Lampeter. It is in the parish of Kennarth, which had, in 1831, 1935 inhabitants, of whom it is likely nearly one half are in the hamlet of Emlyn, which includes the town. The chapel at Newcastle is a neat modern building. There are some dissenting places of worship.

The hamlet of Emlyn, in which Newcastle is, was included by the Reform Act in the borough of Adpar, as contributory to Cardigan. Newcastle was antiently called Dinas Emlyn (city of Emlyn), and took its name of Newcastle from its fortress being rebuilt by Sir Rhys ap Thomas, in the reign of Henry VII. The situation of this castle, on a sort of peninsula formed by a bend of the Teivi, is very picturesque; the arched gateway, supported by two octagon towers, which faces the town, is a striking object. The greater part of the building has disappeared. There is a salmon-leap on the Teifi, a short distance below Newcastle.

The village of St. Clear's, nine miles from Caermarthen towards Milford, exports a considerable quantity of corn, butter, and other agricultural produce. The parish had in 1831 a population of 1083. There are some remains of an alien priory of Cluniac monks formerly existing here, a cell to St. Martin de Campis at Paris. St. Clear's had once a strong castle, the site of which is indicated by an artificial mound of earth.

Divisions for Ecclesiastical and Legal purposes.—This county is in the diocese of St. David's, and for the most part in the archdeaconry of Caermarthen; a very small part is in the archdeaconry of Cardigan. The number of parishes, according to the population returns, is 76; but in the 'Beauties of England and Wales' this statement is charged as incorrect, and the number of parishes is given at 78, with 12 chapelrys in addition. The county is in the South Wales circuit; the assizes are held at Caermarthen, also the Epiphany, Easter, and Michaelmas sessions; the midsummer sessions are held at Llandilo-vawr.

Caermarthenshire returns two members to parliament: before the Reform Act it returned only one. Caermarthen with Llanelli returns one member; and Newcastle is united with Adpar (Cardiganshire) as a contributory borough to Cardigan. Caermarthen is the chief place of county elections; the polling stations are Caermarthen, Llandilo-vawr, Llandovery, Newcastle-Emlyn, St. Clear's, Llanelli, Llan-sa-nafel.

History, Antiquities, &c.—In the most antient period to which the authentic history of this country reaches, it was inhabited by a British tribe, to whom the geographer Ptolemy gives the name of Demetæ (Δημητῆ), among whose towns he mentions Maridunum (Μαριδουνον), or Caer-marthen. The Demetæ were subdued, it is likely, by Julius Frontinus, the subjugator of the warlike Silures, the neighbours of the Demetæ. To this Roman general are ascribed two Roman roads, the *Via Julia Maritima*, and the *Via Julia Montana*, which cross this county, the first near the coast, probably through Neath and Loughor (Glamorganshire),

and Caermarthen; the second, more inland, by Llandovery and Llandilo-vawr. These roads seem to have united at Maridunum (Caermarthen), and thence to have been continued to the neighbour (St. David's), probably in a direction nearly due west. Other Roman roads have been traced. Near Llanboidy, west of Caermarthen, are the remains of a British or Roman camp, at the entrance of which, in 1692, were found 200 Roman silver coins, of early date, buried in two leaden boxes just under the surface of the ground.

Besides Maridunum there seems to have been another Roman station at Llanfair y Brynn, near Llandovery (see above): this station has been ascertained by the number of roads meeting here, and by various Roman antiquities dug up; but its name is not known, though it is supposed to have been of some importance.

After the departure of the Romans this district was included in the principality of Ceredigion (Cardigan); but in the 9th century it was subject to Rhodri Mawr, or Roderick the Great, who united the whole of Wales into one kingdom. Upon the division of his territories among his three sons, Ceredigion, including Caermarthenshire and nearly all the rest of South Wales, fell to the lot of Cadell, the first of whose government was at Dinas Fawr, or Dynevor, where Rhodri had built a palace.

The division of Wales among the sons of Rhodri was a fatal step; dissensions broke out among the brothers: Cadell conquered Powys (a district between the Wye and the Severn), the heritage of his brother Merfyn. He was himself subsequently attacked by his other brother Anarawd, king of Gwynedd, or North Wales; and in this war Caermarthenshire was ravaged by Anarawd with a powerful force supported by some Saxon auxiliaries. Cadell was succeeded in 907 by his son Hywel, who subsequently united the whole of Wales under his sceptre; and became, under the name of Hywel Dda (or Hywel the Good), celebrated as the legislator of his kingdom. A fresh division of the kingdom after Hywel's death brought new troubles; the occasional re-unions which resulted from mere force were not permanent; and to the misery of these civil broils were added the ravages of Danish invaders. In these contests Caermarthenshire had its share; and two remarkable engagements were fought within its borders: one in 1020, at Abergwilt, near Caermarthen, in which Llewelyn, at that time sovereign of the whole of Wales, defeated and slew a Scottish adventurer, Run, who, personating one of the Welsh princes, had raised a force among the disaffected chieftains; another in 1021, in which Llewelyn defeated two native princes, who were supported against him by the Irish and Scots, but fell himself in the action through treachery. This battle was fought near Caermarthen. Throughout these contests Dynevor continued to be the seat of government for South Wales.

Some years after the conquest of England by the Normans, the great feudal lords, whose possessions bordered upon Wales, began a series of encroachments upon the principality of South Wales, by which it was gradually reduced to the counties of Caermarthen and Cardigan; even these were for some time in the possession of Henry I. of England. During this possession it is likely that several of the castles built by the Norman barons had their origin; some of them may have been erected during earlier encroachments on the territory. A considerable part of the principality of Dynevor was given up by Henry I. to a Welsh prince who laid claim to it, and whom Henry found himself unable to subdue. This prince appears however to have been a feudal subject of the crown of England. He was subsequently again involved in hostilities with the English. The castles of the Norman lords were several of them taken and partially demolished; some of them were afterwards recovered by the Normans and repaired. Gradually the princes of Wales sunk into the character of subjects of England, and their hostilities with each other and with the neighbouring Norman lords assume more the character of the struggles between powerful and restless nobility for territory or pre-eminence than of the resistance of one nation to the aggression of another. In the wars between Llewelyn, prince of North Wales, and Henry III., Caermarthenshire became the scene of contest; and in a severe action, the English, who were besieging Dynevor castle, were entirely defeated by the troops of Llewelyn, aided by some chieftains of South Wales. In the final contest between Llewelyn and Edward I. the Welsh were entirely

defeated near Llandilowawr, and Llewelyn was subsequently beset by the English and killed while apart from his army. When the complete subjugation of Wales took place in the reign of Edward I., Caermarthen became the seat of courts of law which that prince established for South Wales. The subsequent revolts of the natives were suppressed and punished as acts of treason. During the revolt of Owain Glyndwr, at a subsequent period, Caermarthen castle was taken by a body of French sent to support that chieftain.

Of the troubled period which preceded the conquest of South Wales this county possesses several memorials in the baronial castles, the remains of which are so numerous. Those of Caermarthen, Kidwelly, Laugharne, Dynevor, Carreg Cennen, Llandovery, Llangadoc, Emlyn, and St. Clear's, have been already noticed. Two call for notice here, Llanstiffan, or Llan Stephan, on a rock of great height on the right bank of the Towy, near its mouth: and Dryslwyn, in the vale of the Towy, on the right bank of the river between Llandilowawr and Caermarthen. Llan Stephan castle commands the entrance of the river; and from it there is a fine prospect on the one side towards Caermarthen, and on the other towards Tenby in Pembrokeshire, across a fine bay. The ruins are not very considerable, but they form a most picturesque object, whether viewed from the land or the water; and there is sufficient of them to show that the area enclosed by the castle walls must have been large.

Of the monastic institutions of this county there are scarcely any remains of note. The ecclesiastical ruins at Caermarthen, Kidwelly, and St. Clear's, have been mentioned; to these we may add Tallich or Talley abbey, in the vale of the Gorly, founded by Rhys ap Gruffyd, prince of South Wales, who died A.D. 1197, for Premonstratensian canons, possessing a gross yearly revenue, at the dissolution, of 133*l.* 1*s.* 4*d.*, or 136*l.* 7*d.* clear; and Albaniada or

Whitland Cistercian abbey, on the left bank of the Tare, the date of whose foundation is disputed; its yearly revenue at the dissolution was 153*l.* 17*s.* 2*d.* gross, or 135*l.* 3*s.* 6*d.* clear. Neither of these ruins are remarkable.

In the civil war of the 17th century this county, together with those of Pembrokeshire and Cardigan, was held for the king by Richard Bury of Carberry. The parliamentary forces opposed to him were commanded by General Laugharne, who took from the royalists the castles of Caermarthen and Laugharne. At a subsequent period Laugharne deserted to the royalists; upon his defeat, with his coadjutors by Colonel Horton, several skirmishes took place in Caermarthenshire as the defeated party retreated towards Pembroke castle, where they were besieged by Cromwell, and forced to surrender.

Statistics.—Population. Caermarthenshire is chiefly an agricultural county. Of 23,361 males 20 years of age and upwards, residing within the county in 1831, it was found that 12,749 were engaged in agricultural pursuits, and only 292 in manufactures or making machinery. The latter number were chiefly employed in weaving woollens, and were not confined to any particular part of the county, being so dispersed that not more than fourteen weavers resided in any one place. The number of persons so employed was about 260. Machinery for weaving is constructed at Llanelly and Llangelor.

The following summary of the population as it existed in May, 1831, shows the number of inhabitants and their occupations in each hundred, &c., of the county.

HUNDREDS, &c.	HOUSES.				OCCUPATIONS.			PERSONS.			Males twenty years of age.
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, in manufactures, or handicraft.	All other families not comprised in the two preceding classes.	Males.	Females.	Total of persons.	
Carnwallon	2,010	2,157	59	39	665	408	1,084	5,426	5,473	10,899	2,671
Cathnog	1,923	2,039	15	33	1,305	451	283	4,747	4,956	9,683	2,254
Cayo	1,181	1,623	14	43	1,016	311	296	3,885	4,041	7,926	1,916
Derrlys	3,061	3,240	33	90	2,003	645	592	7,648	8,275	15,923	3,674
Elvet	2,883	2,995	6	47	1,792	808	395	7,664	8,128	15,792	3,499
Iskenen	1,711	1,835	7	47	1,053	377	403	4,075	4,351	8,426	2,006
Kidwelly	1,924	2,058	16	76	939	437	712	4,858	5,143	10,001	2,305
Perfedd	2,564	2,615	26	88	1,171	863	581	5,821	6,314	12,135	2,851
Caermarthen (borough)	1,563	2,127	10	41	41	999	1,087	4,579	5,476	9,955	2,182
Totals	18,920	20,719	186	504	9,987	5,299	5,433	48,683	52,057	100,740	23,361

The absolute population of Caermarthenshire at each of the four enumerations made in this century was:—

	Males.	Females.	Total.	Inc. per Cent.
1801			67,317	
1811			77,217	14.70
1821	43,577	46,662	90,239	16.86
1831	48,683	52,057	100,740	11.54

Showing an increase between the first and last enumerations of 33,423 persons, or nearly 50 per cent., which is somewhat below the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the three periods of

1811 were £23,548 being an average of 6 <i>s.</i> 1 <i>d.</i> for each	
1821 27,283 6 0 inhabi-	
1831 33,598 6 8 tant.	

The sum expended for this purpose in the year ending the 25th March, 1834, was 33,755*l.* 4*s.*, which on the supposition that the population has gone on increasing since 1831 at the same rate of increase as in the ten preceding years, is an average of 6*s.* 5*d.* for each inhabitant. All these averages are below those for the whole of England and Wales.

The sum raised within the county for poor's rate, county

rate, and other local purposes, in the year ending 25th March, 1833, was 44,587*l.* In the same year there was expended—

For the relief of the poor	36,251 19
In suits of law, removal of paupers, &c.	1,377 4
For other purposes	7,363 15

£44,992 18

The descriptions of property assessed for local purposes are not distinguished in the returns made up for the year ending March, 1834. The total amount levied in that year was 43,994*l.*, and the expenditure was as follows:—

For the relief of the poor	33,755 0
In suits of law, removal of paupers, &c.	1,850 3
For other purposes	7,807 17

£43,413 4

A saving has therefore been effected of nearly 7 per cent. in the expense of relieving the poor, but the other expenses have increased, and therefore the saving on the whole amount is only about 3½ per cent.

The number of turnpike trusts in Caermarthenshire, in 1829, was 10, and the length of roads under their charge 519 miles: the annual income arising from the tolls and

parish composition was 71187, and the annuities 61487.

The county expenditure for various purposes, exclusive of the relief of the poor, was 24807. 0s. 41d. in 1830. The sum levied for county rate, in 1833, was 45006.

The number of persons charged with criminal offences in Caermarthenshire, in the three septennial periods ending with 1820-1827, and 1834, were 164, 147, and 288 respectively, being an average of 23 annually in the first period, of 21 in the second, and of 38 in the third period. The numbers of persons tried at quarter-sessions in 1831, 1832, and 1833, were 23, 23, and 11 respectively. Of these the number who had committed

	1831.	1832.	1833.
Felonies were	17	18	6
Misdemeanors	6	15	5
Of whom were convicted	11	23	4
Acquitted	10	10	7

The total number of persons charged with crimes at the sises and sessions, in 1835, was 38; of these 4 were fences against the person, 8 against property committed with violence, and 26 offences against property committed without violence; of which 19 were cases of simple larceny, 10 of arson, 6 of robbery and housebreaking; there were 3 cases of murder. Of the persons charged with offences only 3 were females.

Of these, 14 could read and write, 5 could read only, and 16 could neither read nor write, in which latter number all the females are included; the degree of instruction of the remaining 23 could not be ascertained. The proportion of the offenders to the population in 1835 was 1 in 2651.

There is one savings-bank in the county; the number of depositors and amount of deposits on the 20th November, 1832, 1833, and 1834, were respectively,—

	1832	1833	1834
Number of depositors	281	259	278
Amount of deposits	£8535	7653	7902

Education.—The following abstract of the number of schools, &c., in Caermarthenshire, is taken from parliamentary returns on the subject given in 1835:—

	Schools	Scholars	Total.
Infant Schools	5		
Number of infants at such schools, ages from 2 to 7 years, sex not specified		130	
Daily Schools	161		
Number of children at such schools, ages from 4 to 14 years:—			
Males		1924	
Females		1182	
Sex not specified		2769	
Schools	166		587
Total of children under daily instruction			6005
Sunday Schools	207		
Number of children and others at such schools:—			
Males		3771	
Females		3101	
Sex not specified		11,544	
			18,416

Those children who are both in the Sunday schools and the day schools are entered twice in the foregoing abstract.

Maintenance of Schools.

Description of Schools	By endowment		By subscription		By grants from parishes		
	Schls.	Scholar	Schls.	Scholar	Schls.	Scholar	
Infant Schools	—	1	40	4	90		
Daily Schools	20	13	838	122	3984		308
Sunday Schools	3	193	17,648		364		88
Total...	23	1061	213	18,526			396

Schools established by Dissenters included in the above.

	Schools.	Scholars.
Infant schools	—	—
Daily schools	11	400
Sunday schools	138	12,739

Two boarding schools are included among the 161 daily schools.

The schools established since 1818 are—

Infant and other daily schools 65, containing 2943 scholars.
Sunday schools 178, 12,668

Lending libraries of books are attached to four schools in the county.

CAERNARVON or CAER-YU-ARFON (the town fortress in Arfon), a town in North Wales upon the Menai Strait, the capital of the county, and it gives name, 285 miles from London, by Bangor and Bala. It is in 53° 9' N. lat. and 4° 14' W. lon.

The remains of the Roman station Segontium (*Itin. Anton.*), known by the name of Caer-segont, intersected by the road leading to the church of Llanbeblig, in which parish Caernarvon stands. They are about a mile from the town, and consist of some fragments of the wall. The inclosure was of an oblong form, and comprehended about six or seven acres, on the summit of a small elevation on the east or right bank of the river Seiont. A Roman road is still traceable leading to Dinas Dinorddwig, a Roman station a few miles to the E. On the west bank of the Seiont is a Roman fort still nearly entire. The walls are about 11 or 12 feet high and 6 feet thick, with three parallel rows of circular holes about three inches in diameter running all round the walls. Where the facings are dilapidated the peculiarity of Roman masonry is easily discoverable. Near one corner of the work is a heap of stones which once formed a circular tower, and the foundations of similar towers are visible at the other corners.

The present town of Caernarvon is probably the representative of the native town, which was adjacent to the Roman station. The situation appeared to Edward I. a favourable one for erecting a fortress to curb his newly conquered subjects, the Welsh. In 1282 he commenced the building of Caernarvon castle, and it has been said, notwithstanding its extent, to have been built within a year; a more authentic record, however, speaks of its building as having occupied twelve years, and the revenues of the archbishopric of York (which was kept vacant a time to serve this turn) were appropriated to defray the cost: the walls of Segontium furnished a part of the materials; limestone was brought from Anglesey, and other materials from Vaeol, between Caernarvon and Bangor. John de Havering was appointed the first governor, and was to keep up a garrison of 80 men. In this castle, in 1284, the first English 'Prince of Wales,' afterwards the unhappy Edward II., was born.

Upon a rising of the Welsh in 1294, under Madoc, an illegitimate son of Llewelyn, prince of Wales, Caernarvon castle and town were taken by the insurgents, the English inhabitants massacred, and the place burnt. In the insurrection of Owain Glyndwr it was defended for the king Henry IV. by two Welsh captains, to whom it had been intrusted. In the civil war of Charles I. and the parliament the castle, which was in the hands of the royalists, was taken by captain Swanley, a parliamentarian, with 400 prisoners and a quantity of arms, ammunition, and other booty. It was soon however retaken by the royalists. In 1646 it was again besieged by the parliamentary forces under generals Mytton and Laugharne; and Lord Byron, the governor, was reduced to surrender, though upon honourable terms. In 1648 General Mytton was besieged here by a force under Sir John Owen, but the approach of a superior force obliged Sir John to raise the siege, and his defeat shortly afterwards led to the entire submission of North Wales to the parliament.

Caernarvon occupies a peninsula formed by the Menai strait on the north and west sides, and the Seiont on the south. The town is walled: the walls are defended by round towers, and had originally only two gates: other openings have been subsequently made to form a communication with the suburbs on the east, which have so far increased as to make a new town. The town walls unite with the castle, which is on the south side of the town on the banks of the Seiont; the streets are narrow but regularly laid out, crossing at right angles, and are well paved and lighted. The quay is on the south side of the castle, extending along the Seiont, and there is a terrace outside the town wall and along the shore of the Menai, extending from the quay to the north side of the town. There is also a pier projecting into the Seiont.

The town-hall is over one of the ancient gates of the town. The county hall, in which the assizes are held, is a commodious building inside; the county prison is small. There are a new market-house and a corn-market, formerly used as the general market-house and shambles. The chapel of ease for Caernarvon is in the parish of Llanbeblig, (the

church of which is at some distance), and has been much enlarged and improved of late years.

The external walls of the castle are nearly entire, enclosing a space of three acres, of an oblong shape: they are from eight to ten feet thick, and have within their thickness a covered gallery with loop-holes for the discharge of arrows. There are in the circuit of the walls numerous embattled towers and turrets: these towers are by no means of uniform shape, some are pentagonal, while others have six or eight sides. The Eagle tower, so called from the figure of an eagle carved on it in stone (supposed to be of Roman origin and transported here from the ruins of Segontium), contained the apartment in which Edward II was born. The principal entry to the castle is by a gateway originally defended by four portcullises, under a massy tower, on the front of which is a statue of Edward I. in a menacing posture; another is called Queen's gate, from Eleanor, the queen of Edward I., having entered by this gate when she came here to lie in. The interior of the castle is much dilapidated.

The population of the parish of Llanbeblig in 1831 was 7642, of whom the bailiffs computed 6877 to be within the boundaries of the borough of Caernarvon, but these boundaries extend in some directions two miles from the town. There is no manufacture of any importance: the chief trade is the exportation of copper ore and of slates from the quarries of Llaberris and Llanllyfni in the interior. The trade has been much enlarged since the removal of the coast duty upon slates. Some coast trade is carried on with Liverpool, Bristol, London, and Ireland, and there is a little foreign trade. The port has been much improved, and there is a rail-road from the slate-quarries of Llanllyfni to the town. Carlisle's 'Top. Dict. of Wales' assigns to Caernarvon two weekly markets, Wednesday and Saturday, but other authorities speak only of the Saturday market. There are five annual fairs. Some of the inhabitants are engaged in fishing.

Caernarvon is resorted to as a bathing-place, and many genteel families reside in the town and neighbourhood. There is a handsome hotel built by the marquis of Anglesey, with sea-water baths attached to it. There is also a small theatre, a large national school, and several dissenting meeting-houses.

Caernarvon received the first royal charter which Edward I. granted to Wales. The mayor is, for the time being, deputy-governor of the castle. Caernarvon, in conjunction with its contributory boroughs, Pwllheli, Nevin, Cricceith, Conwy, and Bangor, (the last added by the reform act,) sends one member to parliament. (*Beauties of England and Wales*; Bingley's and Evans's *Tours*, *Population Returns*, *Borough Reports*.)

CAERNARVONSHIRE is situated at the extremity of the main land of Wales, being farther to the N.W. than any other county, except the island of Anglesey. It is between $52^{\circ} 47'$ and $53^{\circ} 21'$ N. lat., and $3^{\circ} 40'$ and $40^{\circ} 45'$ W. long., and is bounded on the N. by the Irish sea; on the N.W., by the Menai strait, which separates it from Anglesey, and by Caernarvon bay; on the S., it is bounded by the great bay of Cardigan, which forms on this coast the smaller bays of Aberdaron, Hell's Mouth, Ceiriad Road, and St. Tudwal's Road; on the S.E. it is bounded by Merionethshire, and on the E. by Denbighshire, from which, for a large part of the boundary, it is separated by the river Conwy. Caernarvonshire is thus on every side, except the E. and S.E. washed by the sea; and toward the land the boundary is for the most part formed by two streams, the Conwy and another stream which separates Caernarvonshire from Merionethshire. There are three detached portions on the east or Denbighshire side of the Conwy: one of these, at the mouth of the river, comprehends the promontories of Great Orme's Head and Little Orme's Head. The form of the county is an irregular oblong, having its greater diameter or length from N.E. to S.W., 54 or 55 miles; and its greatest breadth, at right angles to the above, about 21 or 22 miles. The county contains 544 square miles, or 348,160 acres. It is the smallest of the Welsh counties, with the exception of Radnor, Anglesey, and Flint. The population of the whole county in 1831 was 66,500.

Coast and Islands, Surface, Hydrography, and Communications.—There are no remarkable headlands on the coast, except Great Orme's Head, near the mouth of the Conwy. Penmaen-mawr, a lofty mountain, rises abruptly from the beach, between Conwy and Bangor; the high road

winds along its side. From the foot of Penmaen-mawr the Lavan sands extend towards Bangor, and contract the navigable part of the otherwise wide N.E. entrance of the Menai channel. S.W. of Caernarvon a tongue of low land projects into the Menai, and, with its connected sands, narrows the navigation of that channel in the S.W. entrance. For several miles S.W. from this tongue of land the shore is low, but though the mountains afterwards approach the sea, the shore is not steep until we approach the S.W. extremity of the county, where the Braich y Pwll, the promontory of the Canani (*Kaenarvon ákron*) of Ptolemy abruptly rises from the ocean. Before reaching this craggy coast there are numerous little creeks or inlets which form safe retreats for the fishermen of the coast; about this part is abundance of samphire, which sheep and cattle eagerly feed on and grow very fat. The fish caught hereabouts are the herring, the lobster, and the dory. Opposite to the headland of Braich y Pwll is the small island of Bardsey, on which was a religious establishment of very early date.

The south-eastern boundary of the county between the two extremities is more irregular than that to the N.W.: nearly half of it is washed by the sea. From Braich y Pwll eastward are the bay of Aberdaron, the headland of Penrhyn, with the island of Ynys Gwylan, the dangerous bay of Hell's Mouth, and the headland Penrhyn Dû. From this headland the coast stretches to the N.E., being for the most part low and sandy, especially at the point where Caernarvonshire and Merionethshire meet, where a sandy inlet or wash is traversed by one or two streams which here find an outlet to the sea. Across these sands, a portion of which have been reclaimed from the sea, is a passage dangerous indeed, but shorter than round the head of the inlet. Not far from the promontory of Penrhyn Dû are the two small islands of St. Tudwal: on the larger of the two, now inhabited only by sheep and rabbits, and, in the season, by puffins, was formerly a religious house dedicated to St. Tudwal.

Caernarvonshire is traversed in its whole length by mountains, some of which are the loftiest in South Britain. From the western side of the mouth of the Conwy the mountains run S.W., receding gradually from the coast, and presenting in succession the following summits: Taly-Fan and Penmaenmawr (1540 feet), Carnedd Llewelyn (3471 feet), Carnedd Dafydd (3429 feet), Glider Vechan and Glider Vawr, Snowdon (3557 feet, the highest mountain in South Britain). From Snowdon the mountains vary their direction a little, so as gradually to approach the coast; the chief summits are Craig Goch, Bwlch Mawr (1673 feet), Gyngoch, and Rivell (1867 feet), which is close upon the shore. Those summits may be considered as belonging to the main range of the Caernarvonshire or Snowdonian mountains. From the main mass of Snowdon a branch, running in the direction of the town of Caernarvon, has the summit Moel Eilio (2366 feet). Other branches from the central mass occupy the greatest part of the interior of the county, and extend into Merionethshire.

The following description of Snowdon is from Mr. Penant's *Tour in Wales* (vol. ii. p. 170 seq., 2nd edit. Lond. 1784). 'In the course of our ascent saw on our left above the *cwm* (valley) *Moel-y-Cynghorion*, or the Hill of Council. Pass through *Bwlch y Maes cwm*, and skirt the side of Snowdon till we reach *Bwlch y Cwm Brwynog*, where the ascent becomes very difficult by reason of its vast steepness. People here usually quit their horses. We began a perilous march, clambering among the rocks. On the left were the precipices over *Cwm Brwynog*, with *Llyn* (the pool) *du yr Arbbwy* at their foot: on our right were those over the small lakes *Llyn Glas*, *Llyn y Nadroed* and *Llyn Coch*. The last is the highest on this side of the mountain, and on whose margins we were told that, in fairy days, those diminutive gentry kept their revels. This space between precipice and precipice forms a short and no very agreeable sthinus, till we reached a verdant expanse which gave us some respite before we laboured up another series of broken crags: after these is a second smooth tract, which reaches almost to the summit, which, by way of pre-eminence, is styled *Y Wyddfa*, or the Conspicuous: it rises almost to a point, or, at least, there is but room for a circular wall of loose stones, within which travellers usually take their repast.

The mountain from hence seems propped by four vast buttresses, between which are four deep *cwm*s or hollows; each, excepting one, had one or more lakes lodged in its distant bottom. The nearest was *Llynnon Llafor* (the green

well, lying immediately below us. One of the company had the curiosity to descend a very bad way to a jutting rock that depended over the monstrous precipice, and he seemed like Mercury ready to take his flight from the summit of Atlas. The waters of Ffynnon Llas from this height appeared black and unfathomable, and the edges quite green. From thence is a succession of bottoms surrounded by the most lofty and rugged hills, the greatest part of whose sides are quite mural, and form the most magnificent amphitheatre in nature. The *Wyddfa* is on one side; *Crib y Distill*, with its serrated tops, on another; *Crib Coch*, a ridge of fiery redness, appears beneath the preceding; and opposite to it is the boundary called *Llivedd*. Another very singular support to this mountain is *Y clawdd Coch*, rising into a sharp ridge, so narrow as not to afford breadth even for a path.

The view from this exalted scene is unbounded. In a former tour I saw from it the county of Chester, the high hills of Yorkshire, part of the north of England, Scotland, and Ireland; a plain view of the Isle of Man; and that of Anglesey lay extended like a map beneath us, with every hill visible. I took much pains to see this prospect to advantage; sat up at a farm on the west till about twelve, and walked up the whole way. The night was remarkably fine and starry; towards morn the stars faded away, and left a short interval of darkness, which was soon dispersed by the dawn of day. The body of the sun appeared most distinct, with the rotundity of the moon, before it rose high enough to render its beams too brilliant for our sight. The sea, which bounded the western part, was gilt by its beams, first in slender streaks, at length glowed with redness. The prospect was disclosed to us like the gradual drawing up of a curtain in an amphitheatre. We saw more and more, till the heat became so powerful as to attract the mists from the various lakes, which in a slight degree obscured the prospect. The shadow of the mountain was flung many miles, and showed its bicapitated form; the *Wyddfa* making one, *Crib y Distill* the other. I counted this time between twenty and thirty lakes, either in this county or Merioneth (Merioneth) shire. The day proved so excessively hot, that my journey cost me the skin of the lower part of my face before I reached the resting-place, after the fatigue of the morning.

On this day the sky was obscured very soon after I got up. A vast mist enveloped the whole circuit of the mountain. The prospect down was horrible. It gave the idea of a number of abysses, concealed by a thick smoke, furiously circulating around us. Very often a gust of wind formed an opening in the clouds, which gave a fine and distinct view of lake and valley. Sometimes they opened only in one place; at others in many at once, exhibiting a most strange and perplexing sight of water, fields, rocks or chasms in fifty different places. They then closed at once, and left us involved in darkness; in a small space they would separate again, and fly in wild eddies round the middle of the mountains, and expose, in parts, both tops and bases clear to our view.

The name of Snowdon is the Saxon translation (*Snap-bone* snow-mountain) of the ancient Welsh name *Craigie'r Ben*, according to Pennant.

From the small size and peninsular form of this county, and the consequent nearness of the mountains to the sea, the rivers are small though very numerous. Many of them rise from or expand into lakes, which bear the general native name of *Llyn*, lake or pool.

The Conwy or *Cyn wy*, i. e. 'chief water' (the *Toisobius* of Ptolemy), rises in that part of the county which lies between Merioneth and Denbighshire. *Llyn Conwy*, from which it flows, is one of the largest sheets of water in the county, being about a mile long and three-quarters of a mile broad, surrounded with deep bogs and masses of rock, and producing a sort of char or red trout. From the south corner of this lake the river flows with great rapidity, and making a circuit runs first north-east and then north-west, being swelled by many small streams from the neighbouring hills,—the *Serw* from *Llyn Serw*, the *Clettwr*, and the *Avon Hwch*, on the right; the *Machno*, and the *Lelau* or *Lleder*, on the left. The fall of the *Machno* forms one of the finest though not the largest cataracts in Wales: close to the junction of this stream there are two falls of the Conwy, one above the junction, and one below. There are rapids in the *Lleder* just above its junction. From the junction of the *Lleder* the Conwy turns

to the north, which continues to be its general direction, till its outfall. It receives on the left the *Llugwy*, which rises in *Ffynnon Llugwy*, under the mountain *Carnedd Dafydd*; and receives the water of two small lakes near *Capel Curig*. This *Llugwy* forms several very picturesque falls a few miles below *Capel Curig*. Below the junction of the *Llugwy* the Conwy passes the town of *Llanrwst* (Denbighshire), where the navigation commences, and receives on the left several streams which flow from the *llyn*s or lakes of Caernarvonshire, and render it navigable to vessels of above 100 tons, with freights of timber and slates. Near its outfall the river widens into an estuary, and flows under the walls of Conwy Castle into the Irish Sea. Its length is about 28 or 30 miles, for 12 or 13 of which it is navigable.

The *Glas Llyn* rises from the *Ffynnon Llas*, and flows for the most part to the south-west into Cardigan bay, between *Cricceith* (Caern.) and *Harlech* (Merioneth.). Near its source it forms a cascade of about 300 feet, and is altogether one of the most romantic rivers of Wales. It passes through *Llyn Gwynan* and *Llyn y Dinas*, two lakes in a most beautiful valley. The sands at the mouth of this river were very extensive, forming a wash called *Traeth Mawr*, which was dangerous to passengers. In 1625 a design was formed for an embankment, which should shut out the sea and gain this extent of surface for agricultural purposes. The design was not carried into effect then, but has been since executed by a private individual, *W. A. Madocks, Esq.* The whole course of the *Glas Llyn* is about 16 or 17 miles. It is navigable to *Pont Aberglaslyn*.

The *Gwrfai* rises on the west side of *Snowdon*, and flows north-west through *Llyn Cywellyn* into the *Menai*, south-west of *Caernarvon*. The *Seiont*, rising from the same mountain, flows in a similar direction through the two lakes of *Llanberis* into the *Menai* at *Caernarvon*: the *Llyfni*, which has its source also in *Snowdon*, flows west through *llyn* *Llynneu-Nanlle* into *Caernarvon* bay: and the *Ogwen* rises in *Mount Trevaen*, and flows through *Llyn Ogwen* into the *Menai* near *Bangor*. The *Seiont*, which has probably the longest course, hardly exceeds 15 miles in length.

'The quantity of water,' says *Mr. Pennant*, 'which flows from the lakes of *Snowdonia* is very considerable; so much, that I doubt not but collectively they would exceed the waters of the *Thames*, before it meets the flux of the ocean.'

There are no canals in *Caernarvonshire*. A rail-road connects the *Penrhyn* slate quarries with *Port Penrhyn*, near *Bangor*; and another connects the slate quarries of the vale of *Nanlle* with *Caernarvon*. The parliamentary road from *London* through *Shrewsbury* to *Holyhead* crosses the county in a north-west direction from the river *Conwy*, near *Bettws y Coed*, to the suspension-bridge over the *Menai* near *Bangor*. From this road there is a branch on the right from *Bettws* to *Llanrwst* and *Conwy*, and another branch on the left from *Capel Curig* to *Caernarthen*. The mail road from *Chester* to *Holyhead* enters this county at *Conwy*, where it crosses the river by a new suspension-bridge, and runs along the side of *Penmaen-mawr* to *Bangor*, with a branch from *Bangor* to *Caernarvon*. The road from *London* through *Bala* to *Caernarvon* runs *N.N.W.* from *Pont Aberglaslyn* and *Beddgelert* to *Caernarvon*.

Geological and Mineralogical character.—Along part of the coast of the *Menai* channel there is a narrow strip of carboniferous limestone, which also forms the *Groat* and *Little Orme's Head*. A narrow belt of rocks, continually varying in composition, skirts the carboniferous limestone on the land side, as to its geographical position. Within this again we meet with the old red sandstone, which extends along the coast beyond the limits of the limestone, on the north-east from *Bangor* to *Conwy*, and on the south-west to beyond the point where the *Menai* strait opens into the bay of *Caernarvon*; it appears again just by *Braich y Pwll*, which headland is formed by it. The other parts of the north-west coast, the plains from the shore to the foot of the mountains, and the banks of the *Conwy*, are occupied by argillaceous schist, comprehending the clay-slate and grey-wacké-slate of some geologists; and other primitive rocks subjacent to this form the summits of the mountains.

The greater part of the rocks composing the *Caernarvonshire* mountains are schistose hornblende, schistose mica, granite, and porphyry, including considerable blocks of quartz. The western side (of *Snowdon*) by which we descended is very precipitous, consisting of hornstone, upon which are placed a number of basaltic columns, more or less regularly pentagonal, standing perpendicularly to the

plane of the horizon. The columns are of different lengths, about four feet diameter, with transverse joints from six to eight feet asunder, and considerable depositions of thin laminated quartz in the joints.' (*Journal of a Tour through North Wales*, &c. by Arthur Aikin, London, 1797.)

'If from the central ridge of the Snowdon chain (in which term I comprehend the whole mountainous extent of Caernarvonshire from north to south) we proceed to the Menai, it will be found that the primitive rocks in mass, such as the granites and porphyries, occupy the interior and higher peaks; to the side of these are applied the primitive stratified rocks, then come the slates, which terminate in the limestone which forms the bank of the Menai. The same gradation of strata will appear, if, instead of the western we examine the eastern side of Snowdon (*i. e.*, towards the Conwy). 'The variation indeed is not so sudden, but perhaps on that very account is more interesting, as the species and varieties of rocks are more numerous, and in larger masses. From the peak of Snowdon to Llanrwst through Capel Curig are found granite and porphyry in mass, micaceous schistus, and other primitive stratified rocks; serpentine in large blocks and of extraordinary beauty, and hornblende slate mingled with veins and rocks of quartz; from the vale of Llanrwst to Llangollen, *i. e.*, along the valleys of the Conwy and the Dee, 'extend the slates which are there (at Llangollen) circumscribed by the limestone range already mentioned.' (Aikin.)

It will be observed that Mr. Aikin does not notice the old red sandstone which underlies the carboniferous limestone, and rises from beneath it along the banks of the Menai. There is a considerable difference between the chief authorities which we have followed as to the geological character of the shore of the bay of Cardigan. Mr. Aikin describes it as composed of limestone, while in Mr. Greenough's map there are no indications of that rock. The omission of all notice of the sandstone, by Mr. Aikin, causes also his account of the north-west coast to differ materially from Mr. Greenough's map.

There are copper-mines at Great Orme's Head, in the vale of Conwy a little west of Llanrwst, in the vale of Llanberis, and near Pont Aberglaslyn. Lead and calamine are obtained in the vale of Conwy near the junction of the Mlugwy with the Conwy, and in that part of the county which lies east of the Conwy. Millstones are dug in the vale of Conwy. Slates are found in various parts of the county, and form one of the chief articles of export. The finest are those on the west side of the ridge of the Snowdonian mountains, and they become finer as they descend towards the sea. Not only roofing-slates and writing-slates are procured from these mines, but inkstands and other fancy articles are made. Slabs are procured large enough for tomb-stones and paving-slabs.

Divisions, Towns, &c.—Caernarvonshire is divided into ten hundreds. The south-west extremity of the county is occupied by the hundred of Conrautmaen or Cymyrtmaen; adjacent to this are the hundreds of Dulaen or Dmleyn on the north-west coast, and Galflogian or Gyslogion on the south-east; the hundred of Evionydd or Yfionydd, occupies the remainder of the coast of Cardigan bay; and those of Uwch-Gorfaï or Gwrfai, Is Gorfaï or Gwrfai, and Llechwedd Uchaf, occupy the north-west coast, each extending far inland: the upper part of the vale of the Conwy is occupied by the hundred of Nant Conwy, the lower part by that of Llechwedd Isaf; and the parts on the coast east of the Conwy form the hundred of Creuddyn.

The county town is Caernarvon (population in 1831, 6877), on the shore of the Menai Strait, 235 miles north-west of London. There is one city, Bangor (population in 1831, of city and parish, 4731), and four market-towns, Pwllheli, Conwy or Conwy, Nevin or Nofyn, Crickeith or Crickeith, and the newly-built town of Tremadoc.

Pwllheli, on Cardigan bay, has a small port formed by the estuary of three or four small streams, and consists of one long well-built street. 'The town appears to be flourishing; we observed some new buildings in progress; there are some subscription building-clubs in the town, and it is proposed to erect a new church, a subscription for that purpose having been raised.' (*Boundary Reports*.) The harbour has at its entrance a round rock, called Careg yr Imbail, about a mile from the town, to which it is joined by a range of sand-bills; vessels of about 60 tons find the harbour good. A considerable coasting trade is carried on. The exports are chiefly provisions; the imports are coal, cotton goods, and various articles of consumption from

Liverpool, and limestone and a few articles from South Wales. The market is large; the market-days are Wednesday and Saturday; and there are six annual fairs.

Pwllheli is in the parish of Denio, which had in 1831 a population of 2091. The town has a corporate charter, granted by Edward prince of Wales (the Black Prince), and confirmed by Edward III. It is a contributory borough to Caernarvon.

Conwy, or more properly Conwy, or, as it is sometimes called, Aber-Conwy (Conwy-Mouth), is, as its name imports, near the mouth of the Conwy, on its left bank, 223 miles N.W. of London by Whitechurch, Wrexham, Mold, and Denbigh, which is the shortest road.

Some antiquaries have proposed to fix here the Conovium of Antoninus; but the general opinion identifies Conovium with Caer-Rhyn, five miles higher up the river. Edward I. completed a castle, in 1284, which he built in order to bridle his new subjects the Welsh. Soon after its foundation, A.D. 1290, the king was besieged here by the natives, in their revolt under Madoc, an illegitimate son of Llewelyn, and reduced to great extremity by famine before the place was relieved by the arrival of a fleet with provisions. When Richard II. mustered his forces to oppose his rival Bolingbroke (afterwards Henry IV.), after disgusting his adherents and weakening his forces by delay and fickleness, he on a sudden quitted his army by night and privately sheltered himself in Conwy Castle, from whence he was soon afterwards allured and delivered into the power of his enemies. In the civil war of Charles I. the castle was garrisoned for him by Williams, archbishop of York, who appointed his own nephew governor. Irritated however at being superseded in the command of North Wales by Prince Rupert, the archbishop went over to the side of the parliament, and assisted their general, Mytton, in the reduction of the town and castle. The town was stormed in August, 1646, and the castle surrendered in the following November. All the Irish among the prisoners were tied back to back and thrown into the river. The parliament respected this noble edifice when they dismantled most other castles in Wales; but the roofs and floors were afterwards removed by the Earl of Conwy, to whom, after the Restoration, it was granted. One of the towers has a large breach in the lower part, caused by the inhabitants undermining it while digging for slates. The strength of the masonry has kept the upper part in its place. It is to be regretted that the practice of excavating the rock on which the castle stands is still carried on, to the endangering of the walls and apartments.

This fortress, one of the noblest piles in Britain, is in form nearly a parallelogram, extending along the verge of a precipitous rock on the S.E. side of the town: two of the sides are within the walls of the town: the others are washed, one by the Conwy, which here expands into an estuary, the other by a small stream which flows into the Conwy. The walls, which are partly covered with ivy, are of great thickness, twelve to fifteen feet, flanked on each of the two sides without the town by four vast circular embattled towers with slender turrets rising from them. The grand entrance was on the W., towards the town, but there was a communication with the river by small advanced work and a narrow flight of steps cut out of the rock. The interior consists of two courts; the apartments are not traceable, except in a few instances. Ruinous arches and broken walls covered with ivy indicate the extent and greatness of the state hall, 130 feet or more in length, 32 broad and about 30 high.

The town is still surrounded by its ancient walls, which are strengthened at intervals by 21 towers, besides two towers to each of the three entrances. The enclosure of the town walls is triangular, having the castle at one angle; and in the picturesque beauty of its situations few places can equal Conwy. The streets of the town are narrow, many buildings in a ruinous condition, and vacant spaces in the streets show where others have stood. The church, which stands near the centre of the town, was once the conventual church of a Cistercian abbey, founded here, A.D. 1185, by Llewelyn ap Iorwerth, prince of Wales. Of the three gates, one on the E. communicates with the quay and tideway of the river; the W. gate is towards Bangor and Holyhead; that on the S. communicates with a bridge over the creek that washes on one side the base of the castle rock.

In the river, about 100 yards from the rock on which the castle stands, is an insulated rock, eastward from which, for about half a mile, extend sands covered by the sea when the

tide is up, but dry, with the exception of a narrow channel, at low water. When the improvement of the communication with Ireland was under the direction of the parliamentary commissioners, it was determined to throw a suspension bridge from the castle rock to that in the river (between which rocks is a deep and rapid tideway), and to connect the latter with the eastern shore by an embankment across the sands. The works were begun in 1822 and finished in 1826. The width of the bridge, measured between the centres of the supporting towers, is 327 feet; the height of the underside of the roadway above the high water of spring tides 15 feet; the embankment, which is of mountain clay faced with stone, is 2015 feet in length, and averages 9 feet in height above the high water of spring tides, rising to 13 feet at the end next the bridge; the width of the base at the highest part is 300 feet, the breadth at the top 30 feet. The spring tides in this river rise 21 to 24 feet. The architecture of the supporting towers of the bridge is in keeping with that of the venerable castle, to which the western tower is adjacent. (*Account of the Menai Bridge, and Notice of Conway Bridge*, by W. A. Provis, Lond. 1828.)

Its situation on so important a thoroughfare is the chief support of Conwy. There is little trade in the town, which is considered to be in a decayed state, with little prospect of any revival, unless by the increase of the trade in slates quarried in the Caernarvonshire hills. The port is frequented by a few coasting vessels, and some timber and slate are exported. The market is on Friday, and there are four annual fairs. Pop. in 1831, 1215.

The town was incorporated by charter of Edward I. It is governed by a mayor, who is constable of the castle, a recorder, two bailiffs, and other officers. It is a contributory borough to Caernarvon. The living is a vicarage in the gift of the bishop of Bangor. There are some dissenting places of worship, and a school without endowment, for the gratuitous instruction of the poor. (See the *Hist. and Antiquities of Aberconwy, &c.*, by the Rev. Robert Williams, Denbigh, 1835.)

Pearl oysters are found in the Conwy near this town.

Nefyn or Nefyn lies on a small bay on the N.W. coast of the county, 21 miles from Caernarvon along the coast. It was made a free borough by Edward the Black Prince at the same time as Pwllheli. Edward I. had previously held a grand tournament here, just after the conquest of Wales. The town consists of a few straggling houses; it has a small port, but little or no commerce. The church is a plain building; and there are, as in most Welsh towns, several dissenting meeting-houses. The population of the whole parish in 1831 was 1726. The market is on Saturday, and there are four annual fairs. The living is a vicarage in the gift of the bishop of Bangor.

This borough is contributory to Caernarvon. The little harbour of Porth yr Llyn near Nefyn is supposed to have been used by the Romans, as strong entrenchments, apparently their work, may be observed in the neighbourhood.

Crickeith or Cricceith lies on the bay of Cardigan. This is a poor straggling place, with houses built without any regard to order, and having nothing worthy of notice save the ruins of the ancient castle. This is probably of Welsh origin, though ascribed by some to Edward I., who caused some repairs and alterations to be made, to render it more secure. The castle stands on an eminence jutting into the sea, and, though never very large, was probably of some importance from its position. The population of Cricceith in 1831 was 648. Cricceith is a contributory borough to Caernarvon. There is a free school.

Tremadoc, a place of quite modern date, is on the road from London to Crickeith and Pwllheli. It stands upon a portion of the Traeth Mawr, a sandy wash at the mouth of the river Glas Llyn, recovered from the sea by the enterprise of W. A. Madocks, Esq., who built the town, to which he gave his name, Tre-Madoc (*tre*, a house, home, township, or village). Mr. M. laid out the town in the form of an oblong square, having a market-house on the E. side, a handsome building, with the upper story laid out in good assembly-rooms. On the other sides of the area are well-built houses; a church in the pointed style, a place of worship for dissenters, a bank, and a good inn are to be found here. There is a market on Friday.

There are good quays at Port Madoc, about a mile from the town, to which vessels of 300 tons can come up. Slates and copper ore are exported.

Divisions for Ecclesiastical and Legal Purposes.—The

number of parishes given in the population returns is 68, and there are 5 parishes which are partly in this and partly in the adjoining counties, Denbigh or Merioneth. Of these 68 parishes 14 are dependent chapelries, 2 are not noticed in our authority (*The Clerical Guide*), and of 2, by some oversight, we have no account. Of the remaining 50, 24 are rectories, 9 vicarages, and 17 perpetual curacies; to which we may add 1 dependent chapelry and 1 perpetual curacy, not noticed in the population returns. Nearly all the county is in the diocese and archdeaconry of Bangor, some few parishes are in the archdeaconry of Merioneth, and one in that of Anglesey in the same diocese. Three parishes E. of the Conwy are in the diocese of St. Asaph.

Caernarvonshire is in the North Wales circuit. The assizes and sessions are held at Caernarvon. The county returns one member. Caernarvon is the chief place of county election; the polling places are Caernarvon, Conwy, Capel Curig, and Pwllheli. The borough of Caernarvon, with its contributory boroughs of Conwy, Cricceith, Nefyn, and Pwllheli, and the city of Bangor (this last added by the Reform Act), returns one member.

History and Antiquities.—There is some difficulty in determining by what tribe of native Britons Caernarvonshire was peopled at the Roman conquest. The neighbouring districts of North Wales were peopled by the Ordovices, and we incline to comprehend Caernarvonshire in the territory of that tribe. Many persons, induced probably by the circumstance that Ptolemy gives to the headland of Blaich-y-Pwll the name of the promontory of the Canani, *Καγκανών ἀκρόν** (or, according to one MS., *Γαγκανών*), have assigned this county to the Cangi. If, however, this be the tribe against which Ostorius marched in the early part of his command in Britain [BRITANNIA], its situation could hardly be so far W. We therefore cannot agree with those who place the Cangi hereabout. Ptolemy does not mention any such people, and it may be questioned whether *Καγκανών* is the genitive case. That geographer mentions the Conwy under the name of Toisobius. The Romans crossed this county under Suetonius Paulinus when they attacked Mona (Anglesey), about A.D. 59. The Ordovices were not, however, subdued until the time of Agricola, who nearly exterminated them about A.D. 78. In the Itinerary of Antoninus two stations within this county are given: Segontium, now Caer Segont [CAERNARVON]; and Conovium, now Caer-Rhon, near Conwy, where Roman bricks have been found inscribed LEG. X, and the foundations of buildings discovered. The name of this station, Conovium, is evidently connected with that of the river; the latter is called in the map of Richard of Cirencester, Conovius.

In the division of the territories of Rhodri Mawr, or Roderick the Great, between his sons (A.D. 877), Caernarvonshire formed part of the kingdom of Gwynedd (Latin Venedocia) or North Wales, allotted to Anarawd. When the cessation of the northern prairies allowed the English kings (now of the Norman race) to turn their arms against Wales, this county, from its remote situation, difficult access, and mountainous character, became the last asylum of the independence of Wales. It was, however, with the rest of North Wales, completely subdued by Edward I., A.D. 1283. In the subsequent revolt of the Welsh under Madoc, the illegitimate son of Llewelyn, prince of Wales, Caernarvon was taken, and the English settlers massacred. Conwy Castle was besieged, but without effect.

Dolbadern Castle is on a rocky eminence near the junction of the two lakes of Llanberis. It is not ascertained at what time or by whom it was erected, but it is supposed to be of British origin. The foundations of Diganwy Castle, near Great Orme's Head, may be traced. Penrhyn Castle, near Bangor, is of the time of Henry VI., and, up to the period of the alterations made some years since, presented a fair specimen of the domestic architecture of that time.

Caernarvonshire has very few monastic ruins. There was a priory of Black or Austin Canons at Beddgelert, supposed to be the oldest religious foundation in Wales except Bardsey, but there are no remains of it. It was enriched by an endowment of Llewelyn ap Iorwerth, prince of North Wales, who reigned at the end of the twelfth century. At the dissolution its yearly revenue was 7*l.* 3*s.* 8*d.* according to Dugdale, or 6*l.* 3*s.* 8*d.* according to Speed.

Statistics.—Population. Caernarvonshire is mostly an agricultural county. Of 16,709 males 20 years of age and upwards, in 1831, there were occupied in agriculture 8103. Only 143 were engaged in manufactures or in making manufacturing machinery; of these 143 more than 100 were

employed in weaving woollen goods. The following summary of the population as it existed in May, 1831, shows the number of inhabitants and their occupations in each hundred, &c. of the county:—

HUNDREDS, &c.	HOUSES.				OCCUPATIONS.			PERSONS.			Males twenty years of age.
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other families not included in the two preceding classes.	Males.	Females.	Total of persons.

The population of Caernarvonshire at each time the census has been taken in this century was:—

	Females.	Total.	Inc. per cent.
1801		41,521	
1811		49,336	18.82
1821	28,412	57,958	17.48
1831	32,168	66,448	13.44

Showing an increase between the first and last enumerations of 24,927 persons, or about 60 per cent., which is somewhat above the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor, at the three periods of

	£	s.	d.
1811 were 12,493 being an average of	5	0	
1821 „ 16,226 „	5	7	
1831 „ 21,205 „	6	5	

The expenses for the same purpose in the year ending 25th March, 1834, was £20,136/ 3s.; and assuming that the population has increased since 1831 in the same uniform ratio as the average of the ten preceding years, the above sum affords an average of 5s. 10d. for each inhabitant. All these averages are below those for the whole of England and Wales.

The sum raised in this county for poor's rate, county rate, and other local purposes, in the year ending 25th March, 1833, was 25,720/ 7s. In the same year there was expended —

	£	s.
For the relief of the poor . . .	21,319	14
In suits of law, removal of paupers, &c. . .	1,240	0
For other purposes . . .	3,399	0

£ 25,958 14

The descriptions of property assessed for local purposes are not distinguished in the returns made up for the year ending March, 1834. The total amount levied in that year was 25,555/ 4s., and the expenditure was as follows:—

	£	s.	d.
For the relief of the poor . . .	20,136	3	
In suits of law, removal of paupers, &c. . .	1,367	2	
For other purposes . . .	3,469	16	

£ 24,973 1

The difference of expenditure in the two years has therefore been rather more than 6 per cent. in favour of 1834 in money spent for relieving the poor; but the other expenses have increased, and the saving on the whole amount is not quite 3½ per cent.

The number of turnpikes trusts in Caernarvonshire in 1829 was 3: the length of roads under their charge 129 miles; the annual income from the tolls and parish composition was 1463/., and the annual expenditure 1110/.

The county expenditure for various purposes, exclusive of the relief of the poor, was 1911/ 18s. 8d. in 1833.

The sum levied for county rate in 1833 was 2574/ 11s. 9d.

The number of persons charged with criminal offences in Caernarvonshire in the three septennial periods ending

with 1820, 1827, and 1834, were 61, 120, and 152 respectively, being an average of 9 annually in the first period, of 17 in the second, and of 22 in the last period.

The number of persons tried at quarter sessions in each of the years 1831, 1832, and 1833, was 19, 7, and 7: of these there were committed for—

	1831.	1832.	1833.
Felonies . . .	17	6	5
Misdemeanors . . .	2	1	2
The number convicted was . . .	14	6	6
„ „ acquitted . . .	3	1	1

At the assizes and sessions in 1835, 30 persons were charged with crimes; of these 4 were offences against the person, 1 offence against property committed with violence, and 21 offences against property committed without violence: of the latter number 15 were simple larceny: the remaining 4 offenders were committed, 2 for forgery and 2 for riot. Two only out of the number of persons accused were females.

Of the above 10 could read and write, 2 could read only, and 13 could neither read nor write: the degree of instruction of the remaining 5 was not ascertained. The proportion of the offenders to the population in 1835 was 1 in 2215.

Caernarvonshire has two savings-banks; the number of depositors and amount of deposits on the 20th of November, 1832, 1833, and 1834 respectively were:—

	1832.	1833.	1834.
Number of depositors . . .	817	786	826
Amount of deposits . . .	£24,709	23,643	24,549

Education.—The following abstract of the state of education in Caernarvonshire is taken from returns laid before the House of Commons in the sessions of 1835:—

	Schools.	Scholars.	Total.
Infant Schools	2		
Number of infants at such schools, ages from 18 months to 7 years:—			
Males		75	
Females		100	
Sex not specified		—	
			175
Daily Schools	74		
Number of children at such Schools, ages from 4 to 14 years:—			
Males		1594	
Females		1244	
Sex not specified		753	
			3591

Total of children under daily instruction 3766

Sunday Schools 213

Number of children and others at such

Schools, ages from 4 to 18 years:—

Males	8603
Females	7222
Sex not specified	8598
—	24,223

Among the children many attend both the Sunday and Day Schools, and they are therefore twice enumerated in the abstract.

Schools established since the year 1818 :—

Infant and other daily schools 27 containing 1712 scholars.
Sunday Schools 176 „ 20,840 „

Lending libraries of books are attached to six schools in Caernarvonshire.

CAERPHILLY. [GLAMORGANSHIRE.]

CÆSALPINIA, a genus belonging to the tribe Cassiææ, of the natural order Leguminosæ, and especially distinguished by the lowermost of its sepals being arched, the uppermost of its stalked petals being the shortest, its stamens all perfect with shaggy bases, and the fruit a compressed bivalved pod. The species are trees or shrubs, found in both the East and West Indies, with showy yellow flowers, abruptly pinnated leaves, and stems which are usually more or less prickly. It is introduced here because the Brazil-wood of commerce is said to be furnished by two of its species.

One of these, *C. Brasiliensis*, is a West Indian rather than a Brazilian tree, without prickles, downy flower-stalks, panicle flowers, smooth obtuse oblong leaflets. The other, *C. echinata*, which is really a Brazilian plant, is a prickly tree, with yellow and red blossoms, smelling deliciously like lilies of the valley, prickly pods, and oval blunt leaflets. Both these species undoubtedly yield a red wood, but it is by no means clear that they exclusively furnish the Brazil-wood of commerce, as is commonly stated. According to Dr. Bancroft, this article is obtained from a tree with a large crooked knotty stem, the bark of which is so thick, that a tree as large as a man's body with the bark, will not be so thick as the leg when peeled; and he calls this species *C. Brasiletto*, a name unknown to botanists: he however states that it is called by the natives *Ibiripitanga*. Now that is the name given by Marcgraaf to the *C. echinata*, but this author says nothing about the peculiarity in the bark. One authority however ascribes a particularly thick alburnum to *C. echinata*, but says nothing of the bark. Malte Brun says there are three kinds of *mirim* or Brazil-wood found in Brazil; but he includes with them the *C. Brasiliensis*, which there is no good authority for considering a native of that country. Fée again refers the sappan wood of the East Indies (*cæsarpinia sappan*) to one of the Brazil-woods of the merchants. Upon the whole it appears that we have no good testimony as to what the tree is that yields it; but it is probable that it is the produce of many species, and possibly of more than one genus, for Dr. Candolle and Sprengel doubt whether the *cæsarpinia echinata* is not rather a guilandina. It is much to be regretted that travellers generally bring home with them no precise information upon such points as these; but for this we have to thank the system of education in this country, under which natural history is altogether excluded from the studies of young men. The best Brazil-wood is said to come from Pernambuco, where it is called *pão da runha* or queen's wood, on account of its being a royal monopoly. (Macculloch's *Dict. Com.*, 182.)

CÆSAR (*Kairap*), the cognomen or distinctive family name of a branch of the illustrious Julian gens or house. Various etymologies of the name have been given by Roman writers, but they all seem unsatisfactory, and some of them ridiculous, except that which connects it with the word *cæsaries*, properly 'the hair of the head.' It was not unusual for the family names among the Romans to be derived from some personal peculiarity: examples of this are Naso, Fronto, Calvus, &c. The Julian gens was one of the oldest patrician houses of Rome, and the branch of it which bore the name of Cæsar deduced its

origin from Iulus, the son of Æneās, and consequently claimed a descent from divine blood. (Sueton. *Cæsar*.) The Julian gens is traced back historically to B.C. 253, or A.C. 561, but the first person who bore the distinctive family name of Cæsar is probably Sextus Julius Cæsar, who was quaestor A.D.C. 532, and from whom Caius Julius Cæsar, the dictator, may be traced through five descents. (*Transactions of the Royal Society of Literature*, vol. i. pt. 2.)

In pursuance of the will of C. J. Cæsar, the dictator, Octavius, afterwards the Emperor Augustus, who was the grandson of the dictator's sister, Julia, took the family name of Cæsar. Tiberius Nero, who was adopted by his stepfather Augustus, also took the name of Cæsar. Caligula and Claudius, his successors, were descended from Julia, the dictator's sister; and in the person of Nero, the successor of Claudius, the family of Cæsar became extinct. Nero was removed five descents from Julia, the dictator's sister. [Augustus.]

When Hadrian adopted Ælius Verus, who was thus received into the imperial family, Verus took the name of Cæsar. Spartianus, in his life of Ælius Verus, remarks, 'Verus was the first who received the name of Cæsar only, and that not by will, as before, but pretty nearly in the same way as in our times (the reign of Diocletian) Maximianus and Constantius were named Cæsars, and thus designated as heirs to the empire.' Thus the term Augustus under the later emperors signified the reigning prince, and Cæsar or Cæsares denoted the individual or individuals marked out by the emperor's favour as being in the line of succession.

CÆSAR, CAIUS JULIUS, the son of C. J. Cæsar and Aurelia, was born B.C. 100, on the 12th of Quintilis, afterwards called Julius, from the name of the person of whom we are speaking. His aunt Julia was the wife of Caius Marius, who was seven times consul. In his seventeenth year he married Cornelia, the daughter of Cinna, by whom he had a daughter, Julia. This connexion with Marius and Cinna, the two great opponents of the dictator Sulla, exposed him to the resentment of the opposite faction. By Sulla's orders he was deprived of his wife's dowry and of the fortune which he had inherited by descent, stripped of his office of priest of Jupiter (Flamen Dialis), and compelled to seek safety by flight. (Plut. *Cæsar*, i.; Suetonius, *Cæsar*.) Sulla is said to have spared his life with great reluctance, observing to those who pleaded his cause, that the youth 'would be the ruin of the aristocratic party, for there were many Marii in Cæsar.'

He first served under M. Thermus in Asia, and distinguished himself at the capture of Mitylene (B.C. 80 or 79); but his reputation suffered by a report (possibly an unfounded one) of scandalous profligacy during a visit which he paid to Nicomedes, the king of Bithynia. In the following year he served under Servilius Isauricus in Cilicia. The news of Sulla's death soon brought him back to Rome, but he took no part in the movements of M. Æmilius Lepidus, who made a fruitless attempt to overthrow the aristocratic party, which had been firmly established during the tyranny of Sulla. It is not unlikely, as Suetonius observes, that he had no confidence in Lepidus, and that he had penetration enough to see that the time was not come for humbling the aristocracy of Rome. Whatever opinion may be entertained as to Cæsar having very early formed a design to seize on the sovereign power, it is at least certain that from his first appearance in public life he had a settled purpose to break the power of the aristocracy, from which he and his relatives had suffered so much. After his unsuccessful impeachment of Dolabella for mal-administration in his province, he retired to Rhodes, and for a time became a pupil of the rhetorician Molo, one of the greatest masters of the art, whose instruction Cicero had attended, probably a year or two before Cæsar's visit.

For some time Cæsar seems to have had little concern in public life, being kept in the background by the predominance of the aristocratic party and the successful career of Metellus, Lucullus, Crassus, and Pompey. About B.C. 69, being elected one of the military tribunes, he had sufficient influence to procure an enactment for the restoration of L. Cinna, his wife's brother, and of those partisans of Lepidus who after his death had joined Sertorius in Spain. (Suetonius.) The following year he was quaestor in Spain, and on his return to Rome, he was elected *Ædile* for B.C. 65. Just before entering on office he fell under some suspicion of being engaged in a conspiracy to kill the consuls Cotta and

Torquatus, and effect a revolution. Whether there really was a conspiracy or not may be doubted; Cæsar's share in it at least is not clearly established. The office of *Adile* gave Cæsar an opportunity of indulging his taste for magnificence and display, by which at the same time he secured the favour of the people. He beautified the city with public buildings, and gave splendid exhibitions of wild beasts and gladiators. Cæsar, who was now five-and-thirty years of age, had enjoyed no opportunity of distinguishing himself in a military capacity; while the more fortunate Pompey, who was only six years older, was spreading his name and the terror of the Roman arms throughout the East. A favourable occasion seemed to present itself in Egypt. Alexander, the king who had been honoured with the name of friend and ally of the Roman people, was ejected from Alexandria by the citizens. The popular feeling at Rome was against the Alexandrians, and Cæsar thought he had interest enough through the tribunes and the democratical party to get appointed to an extraordinary command in Egypt. But the opposite faction was strongly united against him, and he failed in his attempt. The next year he was more successful. By a judicious application of money among the poorer voters, and of personal influence among all classes (Dion. xxxvii. 37), he obtained the *Pontificatus Maximus*, or wardenship of the ecclesiastical college of Pontiffs—a place, no doubt, of considerable emolument, to which an official residence in the *Sacra Via* was also attached. (Sueton. *Cæsar*, 13. 46.) This union of civil and religious functions in the same person, at least in the higher and more profitable places, was a part of the old Roman polity, which, among other consequences, prevented the existence of a hierarchy with a distinct and opposing interest.

At the time of the important debate on the conspiracy of Catiline (B.C. 63), Cæsar was *prætor designatus* (*prætor elect* for the following year), and accordingly spoke in his place in the senate. He was the only person who ventured to oppose the proposition for putting the conspirators to death: he recommended their property to be confiscated, and that they should be dispersed through the different municipia of Italy, and kept under a strict surveillance. The speech which Sallust has put into his mouth on this occasion, if the substance of it be genuine, will help us to form some estimate of Cæsar's character and his policy at this period. The address is singularly well adapted to flatter the dominant party, and also to keep up his credit with those who were hostile to the aristocratic interests. His object was to save the lives of the conspirators, under the pretext of inflicting on them a punishment more severe than that of death. But for Cato he might probably have carried his motion. According to Suetonius, Cæsar persevered in his opposition till his life was actually threatened by the armed Roman Equites, who were introduced into the senate-house under the pretext of protecting the senate during their deliberations. (Compare Plut. *Cæsar*. viii.) Cicero, who was then consul, and in the height of his prosperity and arrogance, might, it is said, by a single nod, have destroyed this formidable opponent of the order of which he had become the devoted champion; but either his courage failed him, or some motive perhaps more worthy, led him to check the fury of the Equites. In the following year, during his *prætorship*, the opposite faction in the senate, who were bent on crushing Cæsar's rising influence, actually passed a decree (*decretum*) by which Q. Cæcilius Metellus Nepos, one of the tribunes of the plebs, and Cæsar, who strongly supported him in his measures, were declared incapable of continuing in the exercise of their official duties. Cæsar still discharged the judicial functions of his magistracy, till he found that force would be used to compel his submission to this illegal and impolitic act of the senate. The populace were roused by this strange proceeding, and Cæsar apparently might have had their best assistance against his enemies; but prudence for the present induced him to check the zeal of his partizans, and the senate, apparently alarmed by this demonstration, repealed their own decree, and thanked him for his conduct.

An affair which happened during Cæsar's *prætorship* caused no little scandal at Rome. While the ceremonies in honour of the *Bona Dea* were performing in the house of Cæsar, in which women only could be present, the profligate Clodius, putting on a woman's dress, contrived to get admission to these mysterious rites. On the affair being discovered Cæsar divorced his wife Pompeia, whom he had married after the death of Cornelia; and Clodius, after being

brought to a public trial on a charge of impiety, only escaped by bribing the judges or jury. (Cic. *Ep. ad Att.* i. 12, &c.; Don. xxxviii. 45.) From motives of policy Cæsar did not break with Clodius: he probably feared his influence, and already saw that he could make him a useful tool, and a bugbear to Cicero.

The year 60 B.C. was spent by Cæsar in his province of Hispania Ulterior or Southern Spain, where he speedily restored order and hurried back to Rome before his successor came, to canvass for the consulship. The aristocratic party saw that it was impossible to prevent Cæsar's election; their only chance was to give him a colleague who should be a check upon him. Their choice of Bibulus seems to have been singularly unfortunate. Bibulus was elected with Cæsar in opposition to Lucceius, with whom Cæsar had formed a coalition, on the condition that Lucceius should find the money, and that Cæsar should give him the benefit of his influence and recommendation. The scheme of Cæsar's enemies proved a complete failure. Bibulus, after unavailing efforts to resist the impetuosity of his colleague, shut himself up in his house, and Cæsar, in fact, became sole consul. (Dion. xxxviii. 8.) In order to stop all public business, Bibulus declared the auguries unfavourable; and when this would not answer, he declared that they would be unfavourable all through the year. This illegal conduct only tended to justify the violent measures of his colleague. The affair, though a serious one for the hitherto dominant faction, furnished matter for the small wits of the day, who used to sign their notes and letters in the 'Consulship of Julius and Cæsar,' instead of naming both consuls in the usual way.

Cæsar had contrived, by a masterly stroke of policy, to render ineffectual all opposition on the part of his opponents. Pompey was dissatisfied because the senate delayed about confirming all his measures in the Mithridatic war and during his command in Asia; Crassus, who was the richest man in the state, and second only to Pompey in influence with the senatorial faction, was not on good terms with Pompey. If Cæsar gained over only one of these rivals, he made the other his enemy; he determined therefore to secure them both. He began by courting Pompey, and succeeded in bringing about a reconciliation between him and Crassus. It was agreed that there should be a general understanding among the three as to the course of policy; that all Pompey's measures should be confirmed, and that Cæsar should have the consulship. To cement their alliance more closely, Cæsar gave Pompey his daughter Julia in marriage, though she had been promised to M. Brutus. (Plut. *Pomp.* 47.) Cæsar also took a new wife on the occasion, Calpurnia, the daughter of Piso, whom he nominated one of the consuls for the ensuing year. This union of Pompey, Crassus, and Cæsar is often called by modern writers the first triumvirate. The effect of it was to destroy the credit of Pompey, throw disunion among the aristocrats, and put the whole power of the state in the hands of one vigorous and clear-sighted man. (As to the affair of Vettius [Dion. xxxviii. 9.], see Cicero.)

It is unnecessary to detail minutely the acts of Cæsar's consulship, which rather belong to a history of Rome. From the letters of Cicero, which are contemporary evidence, we perceive that the Senate at last found they had got a master whom it was useless to resist; Cato alone held out, but he stood by himself. One of the most important measures of Cæsar's consulship was an Agrarian law for the division of some public lands in Campania among the poorer citizens [for the nature of these laws, see AGRARIAN LAW], which was carried by intimidation. Pompey and Crassus, who had given into all Cæsar's measures, accepted a place in the commission for dividing these lands. Clodius, the enemy of Cicero, was, through Cæsar's influence, and the help of Pompey, adopted into a plebeian family, and thus made capable of holding the office of tribune; an event which Cicero had long dreaded, and fondly flattered himself that he should prevent by a temporising policy. Clodius, the next year, was elected a tribune, and drove Cicero into exile. (Dion. xxxviii. 12, &c.)

The Roman consuls, on going out of office, received the government of a province for one year. Cæsar's opponents unwisely made another and a last effort against him, which only resulted in putting them in a still more humiliating position: they proposed to give him the superintendence of the roads and forests. Vatinius, one of his creatures, forthwith procured a law to be passed, by which he obtained for Cæsar

the province of Gallia Cisalpina, or North Italy, and Illyricum, for five years; and the Senate, fearing the power might grant still more, not only confirmed the measure, but making a merit of necessity, added the province of Gallia Transalpina. 'From this moment,' remarks a lively modern writer (Schlosser, *Universal Histor. Uebersicht*), 'the history of Rome presents a striking parallel to the condition of the French republic during Bonaparte's first campaigns in Italy. In both cases we see a weak republican administration in the capital involved in continual broils, which the rival factions are more interested in fostering, than in securing the tranquillity and peace of the empire. In both cases we find a province of the distracted republic occupied by a general with unlimited power—the uncontrolled master of a territory which, in extent and importance, is equal to a mighty kingdom—a man of superior understanding, desperate resolves, and, if circumstances rendered it necessary, of fearful cruelty—a man who, under the show of democratical opinions, behaved like a despot, governed a province at his pleasure, and established an absolute control over his soldiers by leading them to victory, bloodshed, and pillage.'

The Gallie provinces at this time subject to Rome were: Gallia ceterior, or Cisalpine Gaul (North Italy); and Gallia ulterior, or the southern part of Transalpine Gaul, also called emphatically 'Provincia,' (whence the modern Provence,) whose capital was Narbo, now Narbonne. The Provincia extended from the Mediterranean to the Cevennia mountains, and included the modern provinces of E. Languedoc, Provence and Dauphiné. On the N. it joined the Allobroges, then lately subjected to Rome. When Cæsar, in his Commentaries, speaks of Gaul, which he divides into Aquitania, Celtica and Belgica, he means the Gaul which was then independent, and which he conquered, exclusive of the Provincia already subject to Rome.

In March 58 B.C., while Cæsar was still at Rome, news came that the Helvetians, united with several German tribes, were leaving their country with their wives and children in order to settle in S. Gaul, and were directing their march upon Geneva to cross the Rhone at that place. Cæsar hastened to Geneva, cut the bridge, and raised a wall or entrenchment between the Rhone and the Jura in order to close the passage against the Helvetians. The Helvetians asked permission to pass through the Roman province on their way to the country of the Santones (Saintonge), as they said, and on Cæsar's refusal they resolved to cross the Jura higher up into the country of the Sequani (Franche Comté), with whom they entered into negotiations to that effect. Cæsar, foreseeing danger to the Roman province if the Helvetians succeeded in settling themselves in Gaul, resolved to prevent them at all risks. He left his lieutenant Labienus at Geneva, with the only legion he had in the province, and hastened back to Cisalpine Gaul, where he raised two fresh legions, and summoned three more which had wintered near Aquileia. With these five legions (about 30,000 men) he took the most direct road to Gallia ulterior, crossing the Alps by Ocellum (Exilles, between Susa and Briançon), and marched through the province to the country of the Segusiani, the nearest independent Gaulish people, who lived near the confluence of the Rhone and the Arar (the Saone). The Helvetians meantime having crossed the country of the Sequani had reached the Arar, which divided the Sequani from the Ædui, a considerable nation of Celtic Gaul, who extended from the Arar to the Ligeris, and who were friendly with Rome. The Ædui applied to Cæsar for assistance. He watched the motions of the Helvetians, and having learnt that three-fourths of their number had crossed the Arar, he marched at midnight with three legions, and fell upon those who still remained on the E. bank with the baggage, and killed or dispersed them. These were the Tigurini who, about 50 years before, having joined the Cimbri, had defeated and killed the Roman consul L. Cassius. Cæsar crossed the Arar in pursuit of the Helvetian main body. After a useless conference between Cæsar and old Divico the Helvetian leader, the Helvetians continued to advance into the country of the Ædui, and Cæsar after them. Cæsar's cavalry, 4000 strong, composed of Gaulish horsemen raised in the Provincia and among the Ædui, had the worst in an engagement against 500 Helvetian horsemen. Cæsar discovered that there was a party hostile to Rome among the Ædui, at the head of which was Dumnorix, a young man of great wealth, influence, and ambition, who secretly favoured the Helvetians, although he actually commanded a

body of the auxiliary cavalry under Cæsar. At the same time the provisions which the Ædui had provided to supply to the Roman army were not forthcoming. Cæsar sent for Divitiacus, the brother of Dumnorix, a Ædui, who was friendly to Rome, and told him all he knew about his brother's double dealing. Divitiacus acknowledged his brother's fault, and obtained his pardon. We find afterwards (*De Bello Gallico*, V. 7.) that Dumnorix continued in his heart hostile to the Romans, and at the time of Cæsar's first expedition into Britain refused to embark with his auxiliaries, left Cæsar's camp, was followed, overtaken, and put to death.

The movements of the Helvetians through the country of the Ædui must have been very slow and circuitous, for we find that Cæsar, after following them for a fortnight, was about 18 miles from Bibracte (Autun), which is not above 80 miles from the most distant point of the Arar where they could have crossed. Cæsar, who had now only two days' provisions left, gave up the pursuit, and took the road to Bibracte the principal town of the Ædui. The Helvetians, mistaking this movement for a retreat, turned round and followed the Romans. Cæsar halted on a hill, formed his four old legions in three lines half-way up the hill, and placed in their rear higher up the two new legions, as well as the auxiliaries. The baggage he assembled and entrenched on the summit of the hill. The Helvetians, whom Cæsar on this occasion calls Gauls, for they were in fact a Celtic race, having left all their baggage, waggons, and families in one spot, closed their ranks and formed their phalanx, repulsed Cæsar's cavalry, and advanced to attack his first line. Numbers were vastly in their favour. Cæsar, having dismounted, sent away his own and all the other horses, to preclude all hope of flight, and having harangued his men gave the signal for battle. The legionaries, from their elevated position, threw their javelins with great force upon the advancing Helvetians, and having disordered their phalanx, rushed sword in hand upon them. Owing to the close order of the Helvetian ranks it happened that, in many instances, the Roman javelins transfixed two shields at once, so that the bearers being unable to extricate one from the other, were obliged to throw their shields away and fight unprotected. At last, covered with wounds, the Helvetians retired towards a mountain a mile distant. The Romans followed them, but were attacked in flank by the Boii and Tulingi, 15,000 strong, who formed the Helvetian rear-guard. Cæsar ordered his third line to face about and repel these new enemies, while the other two were engaged against the Helvetian main body who had halted and returned to the charge. This double fight lasted from noon till sunset, during which time none of the Helvetians were seen to turn their backs. They withdrew at last, one part to the mountain and the rest to their baggage, where they continued to fight desperately behind their carts during the night, till they were nearly all killed. The other part, to the number of 130,000 individuals, moved off during the night, and marching in a north direction arrived in the country of the Lingones (Langres): the Romans were unable to follow them, being detained three days on the field of battle in attending to their wounded and burying their dead.

In the Helvetian camp were found written tablets containing the muster of the different tribes which composed the emigration, to the number of 368,000 individuals, of whom 92,000 were fighting men. Cæsar says the tablets were written in Greek characters: it has been supposed by some that they were Etruscan letters somewhat resembling the old Greek, and perhaps introduced into Helvetia by the Rheti or Rasena, an Etruscan people.

After three days, Cæsar marched in pursuit of the Helvetians, who threw themselves on his mercy. Cæsar demanded their arms, hostages, and the surrender of the slaves and other fugitives who had taken refuge among them; and they were ordered to return home, and cultivate their lands. The Boii alone, distinguished for their bravery, were allowed to remain among the Ædui at the request of the latter. A part of one of the Helvetian tribes, pagus Verbigenus, 6000 in number, having marched off in the midst of the confusion and darkness of the night, and taken the way towards the Rhine and Germany, were pursued by Cæsar's order, brought back and 'treated as enemies,' which then meant that they were either put to death or sold as slaves. The Helvetians, who returned home, were mustered by Cæsar, and found to be 110,000 individuals, men, women, and children.

Cæsar says that his principal object in sending the Hel-

vetians back was to prevent the Germans beyond the Rhine from occupying their country and becoming formidable neighbours to the Roman provinces. The report of Cæsar's victory spread rapidly through all Celtic Gaul, the various tribes of which began to look up to him as their arbiter in their internal differences. The Ædui complained to him that Ariovistus, a powerful king of the Germans, being invited by the Sequani and the Arverni, between whom and the Ædui there was an old rivalry, had crossed the Rhine some time before with 15,000 men; who had afterwards increased to 120,000, had defeated the Ædui and their allies in a great battle, had occupied several provinces of Gaul, exacted hostages of them, and was in fact oppressing the country. The Gauls described the Germans as an athletic, fierce, and formidable people. Cæsar, who, during his consulship in the previous year, had induced the senate to acknowledge Ariovistus as a king and friend of Rome, now sent to him requesting an interview which the German declined. Cæsar then required him by message to desist from bringing over the Rhine fresh bodies of Germans, and from molesting the Ædui and their allies, who were neighbours to the Roman Province, and to restore their hostages. Ariovistus replied that as he had never dictated to the Romans what use they should make of their victories, he would not be dictated to by them; that the Ædui were his tributaries by force of arms. Cæsar, learning that other Germans, and particularly the Suevi, a powerful nation, were approaching the Rhine to join Ariovistus, determined on attacking him. He occupied Vesontio (Besançon), a strong town of the Sequani, before Ariovistus could seize it. The fearful reports of the Gauls about the Germans spread alarm in Cæsar's camp, especially among the young officers, military tribunes, prefects, and others, accustomed to the luxuries of Rome, and who had followed Cæsar out of personal friendship (I. 39). Skulking in their tents, they lamented their fate, and were busy making their last wills. The panic spread to the veterans, and Cæsar was told that it would be impossible to advance farther; that the roads were impracticable; that no provisions could be collected, and, in short, that the soldiers would not follow him if he raised his camp. Having assembled the officers, he told them that it was not their business to discuss the measures and orders of their general, ridiculed their fears of the Germans, since the Cimbri and Teutones, the most formidable of that race, had been defeated by the Roman arms, and signified to them that he would raise the camp next morning, and if they refused to follow him, would march forth with the tenth legion alone. This was Cæsar's favourite legion. This harangue had its full effect, and Cæsar marched from Vesontio to meet Ariovistus. After a fruitless interview between the two chiefs, which is graphically described by Cæsar, Ariovistus arrested and put in chains Valerius Proculus, Cæsar's friend and confidential interpreter, and Mettius, who had gone to the German camp to renew the negotiations. Cæsar prepared for battle, but Ariovistus remained in his camp for several days, because, as Cæsar was informed by the prisoners, the German matrons had declared that their countrymen would be losers if they fought before the new moon. Accordingly the Roman general determined to make the attack. The Germans came out, and formed for battle in phalanxes by order of nations, the Harudes, Marcomanni, the Tribocci, the Vangiones, the Nemetes, the Sedusii, and the Suevi; and they placed their waggons, baggage, and women in a semicircle behind them so as to prevent escape. The signal being given, both armies rushed to the encounter with such rapidity that the Romans had not time to throw their javelins, and at once resorted to their swords. Cæsar, perceiving that the left of the enemy was the weakest, commenced the attack on that point; many of his soldiers went up, and, grasping the enemies' shields, tried to snuff them away. Meantime the German right was pressing hard upon the Romans, who were much inferior in numbers, when young Crassus (the son of Licinius), who commanded the cavalry, moved the third or rear line obliquely to the support of the left, and thus recovered the advantage. The Germans gave way, and fled towards the Rhine, which was 50 miles distance, being pursued by Cæsar's cavalry. Many fell, some swam across the river, and Ariovistus among the rest, passed it in boats. Ariovistus's two wives and one daughter were killed in the flight; another daughter was taken. Valerius Proculus and Mettius were both rescued, to the great satisfaction of Cæsar.

Cæsar, having thus terminated the campaign, put his troops in winter-quarters among the Sequani, and himself crossed the Alps to Citerior or Cisalpine Gaul, to hold the usual courts for the administration of justice and the civil business of the province.

The campaign of 57 B.C. was against the Belgic Gauls, a powerful race of German origin, who had been long settled in the country between the Rhine and the Sequana (Seine). Alarmed by the advance of the Romans through Celtic Gaul, the Belgæ had, during the winter, formed a confederacy, and prepared themselves for resistance. Cæsar, with the usual logic of conquerors, found in these preparations a pretext for attack. He raised two more legions in Cisalpine Gaul, and proceeded at the beginning of summer to his camp in the Sequani. He then advanced with eight legions, and in fifteen days reached the country of the Remi, the first Belgic people on that side. The Remi made their submission, and gave him every information concerning the extent and the strength of the confederacy, which amounted, they said, to 300,000 fighting men. After crossing the river Axona (Aisne), Cæsar fixed his camp on the right or farthest bank, and fortified it with a rampart 12 feet high and a ditch 18 feet deep. The Belgæ meantime besieged the town of Bibrax (Bièvre?), belonging to the Remi, 8 miles from the Roman camp. Cæsar sent to its relief his light troops, namely, his Numidians, the Cretan archers, and the Balearic slingers. The Belgæ, raising the siege, advanced towards Cæsar's camp, and made some demonstrations, but Cæsar kept quiet in his entrenchments, and the Belgæ broke up for want of provisions, and resolved to fight each in his own territory. After subjecting the Suessiones, the Bellovaci, and the Ambiani, Cæsar marched against the Nervii, the most powerful of the Belgic nations. A desperate battle was fought on the banks of the Sabis (Sambre?), in which the Nervii actually surprised the Roman soldiers while in the act of tracing and entrenching their camp, and before they had time to form or put on their helmets. Cæsar's cavalry, auxiliaries, servants, drivers, and followers of the camp all ran away, spreading the report of the defeat of the Romans. Cæsar hurried from legion to legion, encouraging the men, and finally succeeded in re-establishing order. The tenth legion came to turn the scale. The Nervii fought desperately to the last, and their nation and name, says Cæsar, were nearly extinguished on that day. It was reported that out of 60,000 fighting men only 500 remained. The women and children sued for mercy, and Cæsar restored to them their territory and towns. The Aduatici were the descendants of a body of Cimbri and Teutones, who had settled towards the confluence of the Sabis and the Mosæ. While on their march to support the Nervii, they heard of the total defeat of their allies, upon which they retired to a strong natural hold, where they were regularly besieged by Cæsar, who formed a line of circumvallation. When they saw the moveable towers and the battering ram approaching their walls, engines of which the Gauls had no idea, they sued for peace. Cæsar required them to throw their arms outside of their ramparts. They did so, but concealed one-third of them; they then opened their gates and mixed with the Roman soldiers. On the evening Cæsar withdrew his men within his lines, but at midnight the Aduatici came out in arms and attempted to scale Cæsar's entrenchments. Being repulsed with great loss, their place was entered the next day, and the people were sold as slaves to the number of 53,000.

Crassus, being detached by Cæsar across the Sequana into Western Gaul, received the submission of the Auleri, Unelli, and Veneti, and other maritime people on the coasts of the ocean; and as the season was growing late, the army went into winter-quarters in the country of the Carnutes (about Orléans), Turones (Tours), and other parts of central Gaul. Cæsar set off, according to his custom, for Cisalpine Gaul, where his friends flocked from Rome to congratulate him on his successes. The senate, on receiving from the victorious general the usual official letters, ordered fifteen days of public thanksgiving to the gods, a period never granted before for any other general.

Cæsar's third campaign, 56 B.C., was against the Western Gauls. Crassus, while wintering with one legion among the Andes (Anjou), sent tribunes and other officers to the Veneti (Vannes in Brittany) and other people on the Atlantic coast to ask for provisions. The Veneti, a powerful commercial sea-faring people who had numerous ships in which they traded with Britain and other countries,

having recovered from the alarm of Cæsar's conquests, arrested the officers of Crassus, and refused to give them up until their own hostages were restored. All the neighbouring maritime tribes made common cause with the Veneti. Cæsar immediately ordered galleys to be constructed on the Ligeris (Loire), and sent also to collect ships on the coast of the Pictones and Santones (Poitou and Saintonge), who were friends with Rome. He directed the fleet to attack the Veneti by sea, while he marched against them by land. He exclaimed loudly against the breach of treaties, and the arrest of the Roman officers after the Veneti had made submission and given hostages, while he acknowledges in his 'Commentaries' that he was afraid other nations would follow the example—'Knowing that it is the nature of all men to love liberty and hate servitude.' This was a critical time for the Roman general, but his presence of mind never forsook him in difficulties. He sent Labienus towards the Rhine to watch the Belgians and Germans. Crassus into Aquitania, gave the command of the fleet to Decimus Brutus, and himself marching against the Veneti, took several of their towns on the coast. But he soon found that by means of their ships they easily moved from one point to another, and that the only way to conquer them effectually was by sea. The description of the ships of the Veneti, their naval tactics, their habits and mode of life, is one of Cæsar's most interesting sketches. [BRETAGNE.] A great naval battle, which lasted all day, ended with the destruction of the fleet of the Veneti, to the number of above 200 ships. Cæsar, determining to strike terror into the neighbouring people, put to death all the senators or chief men of the Veneti, and sold the rest as slaves. The Unelli (in the neighbourhood of Cherbourg) were likewise conquered by Titurius Sabinus; and Crassus defeated the Aquitanians, though with considerable difficulty, and received hostages from various tribes of that remote region. Cæsar himself marched against the Morini and Menapi (Boulogne, Calais, &c., and further to the N. and E.), but the rainy season setting in, the soldiers could no longer remain under tents; and accordingly, after ravaging the country, he placed his troops for the winter among the Auleri, Lexovii, &c. (Normandy). It would appear by the following book, iv. 6, that he went as usual to pass the winter in North Italy. (Compare also v. 53.)

The following year, 55 B.C., Pompeius and Crassus being consulted two German tribes, the Usipetes and the Tencteri, being harassed by the Suevi, crossed the Rhine near its mouth into the country of the Menapi, between the Mosæ and the Scaldis (Scheldt). Cæsar gives an interesting account of the Suevi, the principal German nation with which the Romans were then acquainted. Being resolved to check any disposition on the part of the Germans to cross the Rhine, he set off for the army earlier than usual. He found, as he suspected, that several Gaulish nations had an understanding with the Germans. The Usipetes sent to ask permission to settle in Gaul. Cæsar answered that there was no vacant place in Gaul for fresh emigrants, but that if they chose to settle among the Ubii on the banks of the Rhine, who were themselves at war with the Suevi, he would employ his good offices for the purpose. While negotiations were going forward, Cæsar's Gaulish cavalry, 5000 strong, was suddenly attacked near the banks of the Mosæ by 400 German horsemen, and, as usual, routed. The next day a number of German chiefs and elders came to Cæsar's camp to apologize for the affray. Cæsar arrested them all, and immediately marched against their camp, which being thus surprised and unprepared was easily entered, when the Romans made a dreadful carnage of the Germans. The survivors fled as far as the confluence of the Mosæ and the Rhine, where most of them perished. This was the action about which Cato exclaimed so loudly against Cæsar in the Roman senate.

The Ubii being annoyed by the Suevi appealed to Cæsar, and offered him boats to cross the Rhine. Declining this offer, he constructed a bridge by means of piles driven in the bed of the river. He gives a minute description of the process of building the bridge (iv. 17). The bridge was finished in ten days, when Cæsar marched across, ravaged the country of the Sicambri, and re-assured the Ubii by his presence. Hearing that the Suevi had assembled all their forces in the interior of their country, and considering 'he had done all that the honour and interest of Rome required,' he re-crossed the Rhine after spending 18 days on German ground.

He next made his first expedition into Britain (for which see BRITANNIA). On his return he chastized the Morini, who had attacked some of his detachments, put his troops into winter-quarters in Belgic Gaul, and then repaired to Cisalpine Gaul, as usual. In this year Cæsar's period of government was extended for five years more by a Senatus Consultum.

The next year, 54 B.C., Cæsar, after making an excursion into Illyricum, which formed also part of his government, returned into Gaul, where he had ordered a fleet to assemble at Portus Itius (between Boulogne and Calais) for a second attempt upon Britain. Meantime he visited the Treviri, the most powerful nation in cavalry of all Gaul. A dispute had arisen between Indutiomarus and Cingetorix about the supreme authority; Cæsar, knowing Cingetorix to be well disposed to the Romans, supported his claims. This took place just before the expedition to Britain. On his return from Britain he repaired to Samarobriua (Amiens), where he held a council of the Gaulish deputies. On account of the bad harvest and scarcity of provisions, he was obliged to disperse his legions in various parts of the country for the winter. This proved nearly fatal to the Roman arms. He himself remained in Belgic Gaul to see his legions properly quartered. A fortnight only had elapsed when the Eburones (Tongres), excited by Indutiomarus, revolted and attacked the camp of Titurius Sabinus and L. Cotta, who had one legion and five cohorts with them. Ambiorix, king of the Eburones, alarmed Sabinus by telling him that the whole country was in arms, and that the Germans were coming. Much against Cotta's opinion, Sabinus resolved on retiring towards the next Roman garrison, which was exactly what Ambiorix wished. The Romans were attacked on their march by numerous forces, surrounded, and all cut to pieces. Ambiorix, elated with this success, next attacked the camp of Quintus Cicero, brother to the orator, who was stationed with one legion in the country of the Nervii. Quintus made a brave defence. After several days' siege, the Gauls threw combustibles into the camp and set fire to the huts of the soldiers, which were thatched after the Gaulish fashion. At the same time the Gauls advanced to scale the ramparts. But the legionaries stood firm at their post, and Cæsar, having at last received news, through a Gaulish slave, of the danger of his men, marched with two legions to their relief, defeated the Gauls, and entered Cicero's camp, where he found not one-tenth of the soldiers free from wounds. He praised Cicero, he praised the men, he spoke of the catastrophe of Sabinus and Cotta as a consequence of imprudence, and a lesson to other commanders. He then resolved to pass the winter in Gaul, and stationed himself with three legions at Samarobriua. Indutiomarus, having attacked Labienus, was defeated and killed.

The following year, 53 B.C., which was the sixth of Cæsar's government, symptoms of general disaffection manifested themselves throughout Gaul. The people had been overawed but not subdued. The harshness and rapacity of the conquerors made the Gauls wish to shake off the yoke; but all their attempts were detached, partial, and not combined, and they failed, after giving, however, full employment to the Romans. It was a year of desultory though destructive warfare. Cæsar obtained of Pompey the loan of one legion, and had recruited two legions more in the Cisalpine province. He had now ten legions (60,000 men) under his orders, which was considered a very large Roman army. He first defeated the Senones, the Nervii, and the Menapii: the Treviri were defeated by Labienus. Cæsar then crossed the Rhine again from the country of the Treviri, having constructed a new bridge a little below the former one. He expected that the Suevi would attack him, but that wary people withdrew inland to the entrance of the great forest called Bæfenis (the Harz?), which lay between their territory and that of the Cherusci, and there waited for Cæsar to advance. But the Roman avoided the snare, and withdrew his army across the Rhine, leaving part of the bridge standing for a future occasion. He then marched against Ambiorix and the Eburones, who did not wait for him, but took refuge in the forests and marshes, where they kept up a partizan or guerilla warfare. Cæsar ordered the country of the Eburones to be thoroughly devastated, and invited the neighbouring tribes, Germans and Gauls, to assist in the work of destruction. One German tribe, however, the Sicambri, who had crossed the Rhine for the purpose of booty, thought it expedient to attack the

camp of Quintus Cicero, which they had nearly forced. Ambiorix escaped, notwithstanding all endeavours to seize him; but sentence of death was passed against Acco, the leader of the previous revolt of the Senones. His accomplices, who had escaped, were banished. Having put his legions to winter among the Treviri, Lingones, and Senones, Cæsar repaired to Cisalpine Gaul.

The disturbances which occurred at Rome in consequence of the murder of Clodius made Cæsar turn his attention towards that quarter. He raised troops in every part of the Cisalpine province. These rumours spreading among the trans-Alpine Gauls, exasperated as they were by the execution of Acco and Cæsar's fearful vengeance upon the Eburones, they thought the time was come for one great effort while Cæsar was engaged in Italy. The Carnutes began by massacring all the Romans whom they found in the town of Genabum (Orléans). Vercingetorix, a young man of one of the first families of the Arverni, was placed at the head of a confederacy of the whole of Celtic Gaul. The Bituriges joined the league, and the Ædui themselves wavered in their allegiance. Cæsar hearing this news, and seeing that the affairs of Rome had through Pompey's influence assumed a quieter aspect, set off in the middle of winter (beginning of 52 B.C.) for the province of ulterior Gaul, repaired to Narbo, which was threatened by the Gauls; and having collected some troops, crossed the Cevenna and spread alarm through the country of the Arverni, who hastily recalled Vercingetorix to their defence. Having thus effected his object of causing a diversion, Cæsar moved quickly northwards to the country of the Lingones, from whence he went among the Carnutes, attacked and took Vellaunodunum, Genabum, and Noviodunum. Vercingetorix, in a great council of the chiefs, advised, as the only means of harassing the Romans, to burn and destroy the whole country around them. This was executed in the country of the Bituriges, the villages and towns of which were set on fire, except the town of Avercum (Bourges), which was garrisoned by the Gauls. Cæsar laid siege to Avercum, and took it after a most brave defence, when the Roman soldiers killed all, old men, women, and children. The next siege was that of Gergovia (near Clermont, in Auvergne), which, after a murderous attempt to storm the place, Cæsar was obliged to raise. The Ædui, till then the firmest allies of Rome, had now thrown off the mask, joined the league, massacred the Romans at Noviodunum (Nevers), and seized the depôts, the baggage, and the treasury, which Cæsar had deposited there. Cæsar's next movement was to the north into the country of the Senones, in order to join Labienus and the legions under him. The defection of the Ædui rendered Cæsar's position in the centre of Gaul very difficult. Having effected a junction with Labienus, he directed his march towards the Lingones and the Sequani. Meantime he was enabled to collect a body of German cavalry from beyond the Rhine, which was of the greatest service to him during the rest of the campaign. Vercingetorix, who followed Cæsar closely, had his cavalry defeated by these new auxiliaries of the Romans, upon which he retired to Alesia (now a village called Saint Reine, and also Ales, near Flavigny, and Semur, in North Burgundy, ten leagues N.W. of Dijon). Cæsar immediately invested the place, and began his lines of circumvallation. For this celebrated siege of Alesia we must refer to Cæsar's own account. The whole forces of the Gallic confederation, stated at about 300,000 men, advanced to the relief of Alesia. Cæsar found himself besieged in his own lines, having to fight Vercingetorix from within, and the confederates from without. After a desperate battle, in which the Gauls penetrated into the Roman entrenchments, they were at last repulsed by Cæsar, who was well supported by his lieutenant Labienus. The Gaulish confederates, having sustained a tremendous loss, broke up the camp and returned home. Next day Vercingetorix assembled his council in Alesia, and offered to devote himself to save their lives, by giving himself up to Cæsar. Alesia surrendered, and Vercingetorix was afterwards taken to Rome. Several years after, he walked before the triumphal car of the conqueror; after which he was put to death in prison.

The Ædui and the Arverni now made their submission to Cæsar, who took their hostages, and restored their prisoners. After putting his army into quarters, he stationed himself at Bibracte for the winter. This was the hardest fought campaign of all the Gallic war.

Cæsar's eighth and last campaign in Gaul (51 B.C.) is related by Hirtius, who has continued his 'Commentaries' by writing an eighth or supplementary book. After the great but unsuccessful exertions of the Gauls in the preceding year their spirit was broken, but they still made some expiring efforts. Cæsar easily defeated the Carnutes, where his soldiers made an immense booty. He had more trouble with the Bellovaci (Beauvais), a Belgic nation, who at last submitted and gave hostages, all except Comius, the chief of the Atrebrates, who had once been a friend to Cæsar. He had joined in the general revolt of the preceding year, in consequence of his life having been attempted by Labienus, who sent to him Volusenus Quadratus under pretence of a conference, but in reality with orders to kill him. During the interview, a centurion of Volusenus's escort struck Comius and wounded him on the head, when the Gaulish escort interposed and saved Comius's life. From that time Comius swore he would never trust himself to a Roman. This disgraceful transaction, not mentioned by Cæsar, is related by Hirtius (*Bell. Gall.*, b. viii., 23). A revolt in western Gaul was quelled by C. Fabius, who subjugated all Armorica (*Hirtius*, 31). Gutruatus, chief of the Carnutes, who had joined in the revolt, was taken to Cæsar's camp, whipped with rods till he fainted, and then beheaded. Hirtius says that this inhuman act, repugnant to Cæsar's nature, was forced upon him by the clamour of his soldiers. Cæsar next besieged and took Uxellodunum, a stronghold of the Cadurci (Cahors). Here Cæsar's clemency, which Hirtius repeatedly extols, did not prevent him from sentencing all the men who had shared in the defence of Uxellodunum to have their hands chopped off. Cæsar entered Aquitania, the people of which gave hostages. From thence he repaired to Narbo, and there distributed his army in winter-quarters. He placed four legions among the Belgæ, under M. Antonius, afterwards the celebrated triumvir, Trebonius, Vatinius, and Q. Tullius Cicero; two among the Ædui, two among the Turones, and two among the Lemovices, near the borders of the Arverni. He then visited the Provincia, held the courts, distributed rewards, and went to winter at Nemetocenna (Arras), then within the limits of the country called Belgium. During the winter he endeavoured to heal in some measure the wounds which he had inflicted upon the unfortunate countries of Gaul. He endeavoured to conciliate the principal inhabitants by great rewards, treated the people with kindness, established no new taxes, and by rendering the Roman yoke smooth and light, he succeeded in pacifying Gaul, exhausted as it was by so long and so unforunate a struggle.

In the spring, 51 B.C., he set off for Italy, where he was received by all the municipal towns and colonies of his government with great rejoicings. On his return to Belgic Gaul he reviewed his troops, and soon after returned to the north of Italy, where the dissensions between him and the senate had begun which led to the civil war. This was the ninth and last year of Cæsar's government of the Gauls.

Before the close of his Gallic campaign, Cæsar had probably determined not to divest himself of the command of his army. He feared, and apparently with good reason, that if he were once in the power of his enemies at Rome, his life would be in danger. His connection with Pompey had been dissolved by the death of Julia without any surviving offspring, and by the growing jealousy and fear with which his success in Gaul and his popularity with his army had filled all the aristocratical party. Cæsar's object now was to obtain the consulship a second time, and a special enactment had been already passed enabling him to stand for the consulship in his absence. But Pompey, who at last was roused from his lethargy, prevailed upon the Senate to require him to give up the command of the army and come to Rome in person to be a candidate. Cæsar, who was now at Ravenna, in his province of Gallia Cisalpina, sent Curio to Rome with a letter expressed in strong terms (*Cic. Ep. ad Div.* xvi. 11), in which he proposed to give up his army and come to the city, if Pompey would also give up the command of the troops which he had. These troops of Pompey comprised two legions which had been taken from Cæsar; and by a decree of the Senate were designed for the Parthian war, but had been illegally put into the hands of Pompey by Marcellus the consul. The Senate, acting under the influence of Pompey and Metellus Scipio, whose daughter Pompey had married, passed a decree that Cæsar should give up his army by a certain day, or be considered

an enemy to the state. The tribunes, M. Antonius and Q. Cassius, the friends of Cæsar, attempted to oppose the measure by their *intercessio*, which was perfectly legal; but their opposition was treated with contempt, and thus they gained, what they were probably not sorry to have, a good excuse for hurrying to Cæsar with the news. (Cic. *Ep. ad Div.* xvi. 11.) Upon receiving the intelligence, Cæsar crossed the Rubicon, a small stream which formed the southern limit of his province, and directed his march towards the south. The city was filled with confusion—councils were divided and hesitating—and Pompey, who was the commander-in-chief on the side of the Senate, was unprovided with troops to oppose the veterans of the Gallic wars. Domitius, who had thrown himself into Corfinium to defend the place, was given up to Cæsar by his soldiers, who joined the invading army. The alarm now became still greater, and it was resolved by the senatorial party to pass into Greece, and for the present to leave Italy at the mercy of Cæsar's legions. Pompey, with a large part of the Senate and his forces, hurried to Brundisium, whence he succeeded in making good his escape to Dyrrachium, in Epirus, though Cæsar had reached the town some days before Pompey left it.

From Brundisium Cæsar advanced to Rome, where he met with no opposition. The Senate was assembled, with due regard to forms, to pass some ordinances, and there was little or nothing to mark the great change that had taken place, except Cæsar's possessing himself of the public money, which the other party in their hurry had left behind. His next movement was into Spain, where Pompey's party was strong, and where Afranius and Petreius were at the head of eight legions. After completely reducing this important province, Cæsar, on his return, took the town of Massilia (Marseilles), the siege of which had been commenced on his march to Spain. This ancient city, the seat of the arts and of polite learning, had professed a wish to maintain a neutral position between the two rival parties (*Bell. Civil.* i. 35) and their respective leaders. We might infer from one passage in Strabo, that Marseilles suffered severely either during or immediately after the siege (Strabo, p. 180); but another passage seems to imply that the conqueror used his victory with moderation. (Strabo, pp. 180, 181.)

The title of Dictator was assumed by Cæsar on his return to Rome; but he made no further use of the power which it was supposed to confer than to nominate himself and Servilius consuls for the following year (B.C. 48). The campaign of the year B.C. 48 completed the destruction of the senatorial party. It is given at length in the third book of the *Civil Wars* (where, however, there appears to be a considerable lacuna), and comprises the operations of Cæsar and Pompey at Dyrrachium (now Durazzo), and the subsequent defeat of Pompey on the great plain of Pharsalus, in Thessaly. Surrounded by near 200 senators, who acted like a controlling council, with an army mainly composed of raw, undisciplined recruits, the commander-in-chief, whose previous reputation was more due to fortune than to merit, was an unequal match for soldiers hardened by eight years' campaigns, and directed by the energies of one skilful general. It seems difficult to comprehend the movements of Pompey after the battle. He turned his face to the east, once the scene of his conquests, but he had no friends on whom he could rely, and instead of going to Syria, as he at first intended, he was compelled to change his course, and accordingly he sailed to Pelusium, in the Delta of Egypt. Cæsar, who had pursued him with incredible celerity (*Bell. Civil.* iii. c. 102), arrived a little after Pompey had been treacherously murdered by Achillas, the commander of the troops of the young king Ptolemy, and L. Septimius, a Roman, who had served under Pompey in the war with the pirates. Pompey was fifty-eight years old at the time of his death.

The events which followed the death of Pompey need only be rapidly glanced at. The disputes in the royal family of Egypt and the interference of Cæsar brought on a contest between the Romans and the king's troops, which ended in a new settlement of the kingdom by the Roman general. (See the book on the Alexandrine war.) Here Cæsar formed his intimacy with Cleopatra, then in her 23rd year. Cleopatra afterwards followed him to Rome, where she was living at the time of Cæsar's death [CLEOPATRA]. Early in the following year, B.C. 47, Cæsar marched into the province of Pontus, and entirely defeated Pharnaces, the son of Mithridates, who had exercised great cruelties on the Roman citizens in Asia. He returned to Italy in the

autumn, by way of Athens. At Brundisium he was met by Cicero (*Phil. Cic.* 39), who was glad to make his peace, and had no reason to be dissatisfied with his reception. On his return to Rome, Cæsar was named Dictator for one year, and consul for the following year, with Lepidus. During the winter he crossed over into Africa, where the party of Pompey had rallied under Scipio, gained a complete victory at the battle of Thapsus, and was again at Rome in the autumn of B.C. 46. In the year B.C. 45, Cæsar was sole consul, and Dictator for the third time. During the greater part of this year he was absent in Spain, where Cn. Pompey, the son of Pompey the Great, had raised a considerable force, and was in possession of the southern part of the Peninsula. The great battle of Munda, in which 30,000 men are said to have fallen on the side of Pompey, terminated the campaigns of Cæsar. Pompey was taken after the battle, and his head was carried to Cæsar, who was then at Hyspalis (Séville).

On his return to Rome, Cæsar was created consul for ten years and Dictator for life. On the ides (15th) of March, B.C. 44, he was assassinated in the senate-house [CAURUS]. After his death he was enrolled among the gods (Sueton. *Cæsar*, 88), under the appellation of *DIVOS IVLIVS*, as appears from his medals.

[Brit. Mus. Actual size. Bronze. Weight 347½ grains.]

Cæsar did not live long enough after acquiring the sovereign power to rebuild the crazy fabric of Roman polity which he had demolished in fact, though not in form. But a state which had long been torn in pieces by opposing factions—whose constitutional forms served rather to cherish discord than to promote that general unity of interests without which no government can subsist—where life and property were exposed to constant risk—could find no repose except under one head. A bloody period followed the death of Cæsar, but the fortune of his name and family at last prevailed, and Rome and the world were happier under the worst of his successors than during the latter years of the so-called republic.

The energy of Cæsar's character—his personal accomplishments and courage—his talents for war—and his capacity for civil affairs—combine to render him one of the most remarkable men of any age. Though a lover of pleasure, and a man of licentious habits, he never neglected what was a matter of business. He began that active career which has immortalized his name when he was forty years of age—a time of life when ordinary men's powers of enterprise are deadened or extinguished. As a writer and an orator he has received the highest praise from Cicero; his *Commentaries*, written in a plain, perspicuous style, entirely free from all affectation, place him in the same class with Xenophon and those few individuals who have successfully united the pursuit of letters and philosophy with the business of active life. His projects were vast and magnificent; he seems to have formed designs (Suetonius, *Cæs.* 44) far beyond what the ability of one man could execute, or the longest life could expect to see realised. His reform of the Roman calendar, under the direction of Sosigenes, and his intended consolidation of the then almost unmanageable body of Roman law, do credit to his judgment. He established public libraries, and gave to the learned Varro the care of collecting and arranging the books. Of the eight books of his *Commentaries*, the last is said to have been completed by some other hand. The three books of the *Civil War* were written by Cæsar; but the single books on the Alexandrine, African, and Spanish wars, respectively, are generally attributed to another hand, though it is not at all unlikely that Cæsar left the materials behind him. He wrote a number of other things, the publication of which Augustus suppressed. The

editions of the Commentaries are very numerous; the best is that of Oudendorp, Leiden, 1757, 4to. They have been frequently translated into Spanish, French, English, Dutch, German, and Italian. The Greek translation of seven books of the Gallic War, attributed to Planudes, was first printed in Jungermann's edition, Frankfort, 1606, 4to. (See the articles ANTONINUS ITIN.; ACTA; AUGUSTUS; POMPEY.)

CÆSARĒA (Καῖσαρία), the name of several towns so called in honour of the Roman Cæsars. CæsarĒa, now KesariĒh, the capital of Cappadocia (according to Stephanus Byz.), or in Cilicia (according to Strabo), at the foot of Mount Argæus, was originally called Mazaca. (Strabo, p. 537.) KesariĒh is still a considerable town. Cæsarea in Palestine, on the sea-coast (Acts viii. 40., xxiii. 23), the birth-place of Eusebius Pamphili, received that name from King Herod, in compliment to Augustus Cæsar: under Vespasian, it became a colonia and received the name of Flavia. Another Cæsarea in Palestine, north of the sea of Galilee, is distinguished from that just mentioned by the name of Philippi (Matth. xvi. 13), having been repaired by Philip the tetrarch. [BANIAS.] Sometimes a town received a name compounded of both the titles, Cæsar and Augustus, as Cæsar Augusta, Saragossa, in Spain [AUGUSTA].

CÆSIUS BASSUS, a Roman lyric poet, who lived in the reign of Nero and Vespasian. Persius addressed his sixth satire to him. Quintilian (xi. i.) speaks of him as perhaps next, but still very inferior to Horace. The Scholiast on Persius (Sat. vi. i.) says that he was burnt with his house in an eruption of Mount Vesuvius.

CÆSU'RA, or its Greek equivalent *ρομή*, (that is, *cutting*, the two words being respectively derived from the stems *caed* and *tem*, cut), is the name given by ancient grammarians to the division of a verse into two or more portions by a pause or pauses, the position of which must be consistent both with the rhythm of the metre and the meaning of the words. If in any metre the termination of every foot coincide with the termination of a word, a painful monotony arises which would soon offend the ear; as in the lines,—

Spartia hastis longis campus splendet et horret.—Euz.
Disperge locustas, distabhe, diduc, divide, differ.—Euz.
Here res ad scriptas Lucæ mimicus Aeli.—Luci.

This has led some grammarians to hold the opinion that the several feet of a verse should be blended together; yet this principle might lead to results no less offensive than the lines that have been just quoted, as may be seen in the following verses:—

Sole cadente juvenens nuntia reliquit in arva.

Πολλὰ δ' ἀνύτα κατὰντα παρὰντα τε δοχμία τ' ἤλαον.

Much that has been written about the cæsura betrays an inaccuracy, which has arisen from a neglect of the principle of accent. Those who define verses by the mere order of the long and short syllables find it necessary afterwards to lay down what appear to be arbitrary canons. Thus a word of three long syllables, such as *prorumpunt*, might, according to the usual definition of an hexameter verse, occupy any place which did not interfere with the two short syllables of the fifth foot. Yet an ear acquainted with the true rhythm of this verse would be violently offended by any line beginning with *Et prorumpunt*, or *Continuo prorumpunt*, or *Continuo nostri jam prorumpunt ululantes*. The true objection to these lines is that the accent of the word *prorumpunt*, which of course falls upon the penult, is inconsistent with the demands of the verse, which, in the positions here given to the word, would compel us to falsify the accent, and pronounce *prótrumpunt*. [HEXAMETER.] A part of these difficulties they evade by adding to the previous definition of the hexameter a canon to the effect that there must always be a cæsura at the end of two feet and a half, or three feet and a half, with the additional proviso that the syllable immediately preceding the cæsura must not be a monosyllable. To this canon there are two serious objections besides its arbitrary character: one that it does not exclude *prorumpunt* from its position in the third example; the other that it lays down a rule which is violated in many of the finest verses of the *Æneid*. The same neglect of accents has led to precisely the same difficulties in the other metres.

On the best places for the pause in the particular metres, see DACTYLICS, HEXAM. VERSE, LYRICS, IAMBICS, TROCHÆICS.

The name of cæsura or *ρομή* (or *κόμμα*, which has the

same meaning) is sometimes given to that portion of a verse which precedes the pause. Thus when the pause occurs at the end of the fourth foot of the hexameter, that fourth foot being a dactyl, which is common in the bucolic writers, the four first feet so cut off bear the name of a bucolic cæsura:

(Hermann *Elem. Doctr. Metr.*, pp. 32-37 and 334-343.)

CAFFIC ACID, a peculiar vegetable acid existing in coffee, from which it is separated by precipitating the decoction of coffee with a solution of acetate of lead, and the subsequent action of the subacetate, sulphuretted hydrogen, and alcohol.

Cafeic acid separates from solution in alcohol in the state of brown translucent scales. One of the principal characters of this acid is the aromatic odour of burnt coffee which it yields by dry distillation; when the decomposition is complete, it is dissipated without any residuo.

Cafeic acid appears to exist in coffee, combined lime, magnesia, alumina, and iron. The alkaline cafesates are of a pure brown colour without any admixture of green, and by evaporating the solutions they are obtained in the state of brown, horny masses. Lime and barytes water are precipitated of a yellow colour by cafeic acid; these precipitates are soluble in nitric acid. Cafeic acid does not alter the colour of solutions of the persalts of iron; it precipitates a solution of albumen, but the supernatant fluid has not a slight green tint, which distinguishes it from the tannin of coffee. [CORREX.] According to Pfaff, cafeic acid is composed of

Carbon	29.1
Hydrogen	6.9
Oxygen	64
	100.0

CAFEINE, a neutral vegetable product obtained from coffee, and which was at first supposed to be an alkali. It is procured from the decoction by the action of acetate of lead, sulphuretted hydrogen, &c. Its properties are that during the cooling of a concentrated solution it crystallizes in slender flexible needles, which are opaque and of a silky lustre; when they are obtained by slow spontaneous evaporation, they are long fine prisms, which are transparent and but slightly flexible. Caffeine has little taste, but it is bitter and disagreeable. It requires 50 parts of cold water to dissolve it; but hot water takes up a much larger quantity, and on cooling a crystalline magma is obtained. It is not very soluble in anhydrous alcohol, but readily so in alcohol of 70 or 80 per cent. In ether and oil of turpentine it is insoluble. Acids and alkalis do not combine with or alter it, but they dissolve it more readily than water. Caffeine readily fuses, becomes transparent, and sublimes without residue, and concretes in crystals resembling those of benzoic acid. The salts of iron, copper, and lead produce no effect when mixed with solution of caffeine.

According to Pelletier and Caventou, this substance is composed of

Carbon	46.51
Hydrogen	4.81
Oxygen	27.14
Azote	21.54

100

This substance is distinguished from most others which contain azote in not putrefying when a solution is exposed to the air in a warm place, and in not being precipitated by infusion of galls.

CAFFA. [KAFFA.]

CAFFILA is the term used in Northern Africa for those companies of travelling merchants which in Asia are called caravans. The order in which they are arranged is the same, but the caffilas being generally less numerous than the caravans, this order is not so strictly observed.

CAFFRARIA, **CAFFRELAND**, or more properly **KAFIRLAND**, from the Arabic word *Kafir*, which means 'unbeliever,' 'not Mussulman,' is the name given by Europeans to the eastern part of S. Africa, from the N.E. frontiers of the Cape colony, about 32° S. lat. to Delagoa Bay, or perhaps to Cape Corrientes or Inhumbane in 24° S. lat. But the Caffre race extends still farther N.; perhaps as far as the Zambezi River N. of which are the Makoodas and other genuine negro tribes. The natives whom Salt saw at Sofala Bay, 20° S. lat., he conceived to be nearly allied to the Caffres. The various Betchouana tribes, as well as the Makweens and others to the N.E. of them

and the Damaras on the W. or Atlantic coast, between 22° and 25° S. lat., are of the Caffre race [BETCHOUANA]. The complexion of the Caffres varies from a yellowish brown or copper hue to that of deep black, but this last colour is not very common. The nose approaches to an arched form; they have thick lips and hair curly, but less woolly than the negroes. The Caffre females are among the handsomest in Africa.

The Arabian and other Mussulman traders and conquerors who formed establishments on the Mozambique coast, bestowed the general appellation of Kafir on the native population, with whose name they were unacquainted. This was especially the case with the coast S. of Cape Corrientes, which the eastern navigators always dreaded, as destitute of harbours and inhospitable, and on which therefore they made no settlements. The Portuguese who succeeded the Arabs on the Mozambique coast adopted the word Caffra and Caffraria for this extent of coast, upon which for similar reasons they did not venture. The name has been adopted by the Dutch and the English also, though the natives themselves are unacquainted with it.

Caffraria, properly so called, extends for about 600 miles along the coast, from the Great Key River to Dalagoa Bay, and inland as far as the high land which divides the waters that flow into the Indian Ocean, from those which flow into the Orange river and the Atlantic, and separates the land of the Caffres from that of the Koranna Hottentots, the Bosjesmans and the Betchouana tribes. It runs in a N.E. direction at an average distance of about 100 miles from the sea. The eastern or Caffre side of the ridge is more abrupt than the western, which slopes in a sort of table-land towards the Atlantic. Caffraria is a land of rugged hills and deep valleys. The following sketch is by Lieutenant Steadman.

In travelling through the Amaponda country (between the St. John River and Port Natal), the waggon path lies over an undulating ridge, three or four miles in breadth, and about 800 or 1000 feet above the level of the sea; numerous streams are seen rushing down the deep ravines and valleys; the country is rugged and hilly, exhibiting valleys, ravines, beds of rivers, bush and forest covering the declivities of some of the hills, while the others look bare and red from the iron ore which they contain. Caffre villages are scattered about, and numerous herds of cattle are seen grazing in the plains, while the lower sides of the hills exhibit patches of cultivated ground in all kinds of irregular shapes. To the eastward the view is bounded by the Indian Ocean, which is just visible on a clear day, while to the westward a high ridge of mountains is seen extending for a length of from fifty to sixty miles, which separates the country of the Tambookies from the deserts of the Bosjesmans, which lie in the direction of the Orange River. Beasts of prey are not numerous; now and then a lion, and more frequently a tiger, or rather leopard, are met prowling in the more secluded ravines. Elephants were once numerous, but are now become scarce, except in the large forests near the St. John River and Port Natal. The hippopotamus is found in most of the rivers, and its flesh is eaten by the natives. Rhinoceroses lurk about the thick bushy coverts, as well as hyenas of a very ferocious species. The country abounds in game, antelope, hares, pheasants, and partridges. There are quantities of baboons and monkeys, and also serpents and other reptiles. Copper and iron ore is found in the mountains.

Four principal nations, originally of one stock, occupy the country from the frontiers of the Cape colony to Dalagoa Bay, the Amakosa, the Amatimba, called by the Dutch Tambookies, the Amaponda or Hambana, whom the Dutch have christened Mainbookies, and the Vativahs or Zoolahs, sometimes called Amozoolah. The chief of the Amakosa was until lately the well-known Huniza, who resided on the left or E. bank of the Great Key River. Gaika, one of his subordinate chiefs, resided on the right bank of the Key, and between that and the Keiskamma, and on the immediate borders of the colony. To the N. and E. of the Amakosa are the Amatimba, whose westernmost districts border on the back territory of the colony, towards the sources of the Zwart or Black Key. Vosani, the chief of the Amatimba, died in 1830. The third tribe, the Amaponda or Hambana, dwell eastward of the Amatimba, and extend along the coast towards Port Natal. Their Umkumkani, or great chief, is called Fako, and is said to be powerful; one of their subordinate chiefs, Dapa,

is the son of an Englishwoman, who was wrecked on this coast. The Amaponda are said to be a numerous tribe, and more industrious than the Amakosa and Amatimba: whilst the latter leave all the labour of the field to their women, the Amaponda men work as well as the women; they grow millet or Caffre corn, beans, pumpkins, sweet potatoes or yams, maize, and tobacco. In the Amaponda territory a small tribe of mixed European and Caffre blood has been discovered, the descendants of the crew of some vessel wrecked on this coast. (Captain Riou's *Narrative of Va. Reenen's Expedition*, London, 1792.)

The fourth great tribe of Caffres, and the farthest from the Cape, is the Zoolahs or Vativahs, who under their chief Chaka have overpowered, dispersed, or destroyed all the surrounding tribes, from King George's River N. of Dalagoa Bay down to Port Natal, a tract of above 300 miles in length from N. to S. The Oratontahs, who in 1821-22—ravaged the country near the Portuguese settlement at Dalagoa Bay are the same people as the Vativahs. The Vativahs were originally a small tribe; they came about fifteen or twenty years since from the N., somewhere about or beyond the mountains W. of English River, which falls into Dalagoa Bay. Their language is different from that of the Amakosa, and other southern Caffres, and is said to have more affinity to the Sielwana or Betchouana language. The Vativahs are well acquainted with the use of iron, and some of them have muskets, which they obtained from American traders at Port Natal. They are a fine athletic race; in war they carry large oval shields of bullock's hide, and an umkonto or spear, besides a bundle of assegais. Chaka brought his warriors into a most strict state of discipline, any deviation from which he punished with death. He is described as sanguinary and cruel, like all barbarian conquerors; but he received kindly, in 1825, Lieutenant Farewell, Mr. Fynn, and other Englishmen, and allowed them to settle in his dominions near Port Natal, and granted them a large extent of country, and men to assist them in cultivating it. There is an account of their visit to him, and of the habits of the people, in the appendix to Thompson's 'Travels and Adventures in South Africa.' The country is represented as very fine, rich in pasture, and abounding with cattle. The Vativahs go generally naked, except when they put on their war-dress, consisting of skins round the middle, and feathers on the head; the women wear an apron of hide about the middle. Two traders from the Cape, Messrs. Seoon and M'Luckie, after visiting in 1827 the town of Kurichane in the Moorootzee country, crossed the river Manqua, and travelled first eastward and then southward, for about 140 miles, to the town of Malakatzee, a Zoolah chief, where they traded to the amount of 1800*l.* sterling.

The tribes who live in the lowlands round Dalagoa Bay are said by Captain Owen (*Voyages to explore the Coast of Africa*) to be industrious, well-behaved, and favourably disposed to trade with strangers. He mentions the arrival at Dalagoa Bay of a caravan from the interior, consisting of 1000 natives, with from 300 to 400 elephants' tusks, and a great quantity of cattle. Captain Owen represents the people as honest in their manner of dealing; their prudence will not allow them to give their merchandise for the momentary gratification of rum or tobacco; but they have a great desire for cloth. A similar observation was made, more than three centuries ago, by Vasco de Gama as to the natives whom he saw about Cape Corrientes. In the 'Narrative' by the late Captain Boteler, (1835), are found also many particulars concerning the natives of Dalagoa Bay, and those of Inhambane and Sofala, who are all considered to be of the Caffre race.

Of the countries to the N. of Dalagoa Bay we know very little. The Makweens are known to be in that direction, perhaps 200 miles to the N.W.; their country is a high-land, and is said to rise several thousand feet above the sea. The great western ridge which divides the waters that flow into the Indian Ocean from those of the Cariep is distinctly seen from Dalagoa Bay. An expedition, under Captain Alexander, was to proceed by sea to Dalagoa Bay in 1835, and thence to set off for the interior to explore King George's River or Manica, and to ascertain its identity with the Marique of the Moorootzee, and to open, if possible, a communication with the Makween country. The instructions given to Captain Alexander are found in the fourth volume of the 'Journal of the London Geographical Society,' 1834. We have as yet seen no account of Captain

Alexander's arrival at Dalagga Bay. Another expedition under Dr. Smith, set off in 1834 to explore the sources of the Mapoota River, and lately returned to Cape Town. The report is said to be most satisfactory.

Of the manners and habits of the southern Caffres who are nearer the borders of the Cape colony, we have accounts from several late travellers, Thompson, Steedman, Moodie, Reenie, &c. The account by the Rev. Mr. Brownlee, a missionary, who resided seven or eight years among them, is perhaps the most full and satisfactory, and is given in the appendix to Thompson's 'Travels.' The government of the Caffres is a sort of clanship system. The population of each Caffre tribe is divided into kraals or hamlets, containing from ten to twenty families, each family occupying a separate hut. There is a petty chief in each kraal, who exercises a kind of patriarchal authority over the people. A higher chief rules over a whole district, containing a certain number of kraals. These higher chiefs are hereditary and independent of each other, although they acknowledge to certain extent the authority of the Umkumkani, or great chief of the whole tribe, whose counsellors they are, and who cannot determine upon any important measure concerning the whole tribe without consulting them. The chief, like most Asiatic and African sovereigns, is supposed to be the original possessor of all the land and cattle within his territory. This pretended right, however, is seldom acted upon, but an acknowledgment of it is retained in the custom, that no individual is allowed to kill any of his cattle without permission of the chief, who claims part of the carcase as his right; likewise the first fruits of the season are not allowed to be gathered without permission of the great chief of the tribe. The right of individual families to the land is restricted to the patches of ground which they have enclosed for cultivation; all the rest is held in common by the different families of each kraal for grazing their cattle. The Caffres have no written laws, but certain long-established principles and usages, any infraction of which by a chief would be opposed by his subjects at large. There is however an evident disposition on the part of the chiefs to make themselves absolute, as Chaka succeeded in doing among the Zoolahs. A great engine of despotism is found in the Amakira or witch doctor, who acts as a sort of inquisitor; and when in secret understanding with the chief, serves him to remove out of the way or frighten all those who might have opposed him. The unfortunate individual accused of witchcraft is put to a cruel death, and his cattle divided among his accusers. In other matters the punishment of death is not common, most offences being expiated by a fine, excepting robbery on the property of a chief. The Caffres acknowledge the existence of a supreme being, for whom they have several names in their language, but they have no form of worship, and their notions of a future life are very vague and unsettled. They have no idols, but have other superstitions, believe in witchcraft, spirits, apparitions, and they sacrifice animals to propitiate the ghosts of the dead. A Caffre swears by the spirit of his father, or by his chief. They circumcise boys at the age of twelve or fourteen, and the ceremony is attended with considerable solemnity, they seem however to have no distinct idea of the object of the practice, or whence they derived it. They have a decided aversion to swine-flesh, and also it is said to fish, except shell-fish; accordingly they have neither boats, canoes, nor nets, or other implements for fishing.

The huts of the Caffres are hemispherical, and mostly from eighteen to twenty feet in diameter, and from six to seven feet high. Poles are stuck into the earth, and flexible boughs are twisted between and arched over the top; they then are thatched with straw, and plastered over with clay or cow-dung; a small aperture is left for the door, which is made of basket-work. The fire-place is in the centre of the hut, and there is no aperture to let out the smoke but through the doorway. A few mats, coarse earthenware pots of native manufacture, a rush basket so closely woven as to contain liquids, a calabash, and a bundle of assegais—these constitute all the furniture of a common Caffre hut. Some have milk sacks made of bullock's hide, and wooden vessels carved out of soft wood. They preserve their millet or corn in pits dug in the ground, like the Berbers and other North Africans. The kaross, or cloak made of softened hide, is the dress of both men and women. The female wear besides a petticoat of leather round the loins, and usually also a covering over the bosom; the men go often totally naked. The beauty of the Caffre women

has been much spoken of, and probably exaggerated. The men are tall, straight, robust, and muscular, firm of carriage, open and manly in their manners, and when at peace have a remarkable expression of good nature on their countenance. They bring to market, on the borders of the Cape colony, elephants' tusks, gum, hides, mats, rush baskets, &c. to a considerable amount. As yet the southern Caffres, unlike their brethren of the Betchouana and other northern tribes, hold European cloth in little estimation, but are very fond of beads, and other ornaments; they also purchase knives, tinder-boxes, and other hardware articles.

The result of the last Caffre war in 1835 has been to extend the limits of the colonial territory, from the Keiskamma, the former boundary, as settled by a treaty with the late Gaika, to the Great Key River, by which a large and fine tract of country has been evacuated by the Amakosa, and left at the disposal of the British authorities. Another result has been, that a tribe called Fingoes, who were the remains of a numerous race, who between ten and twenty years had lived N. of Port Natal, whence they were driven away by Chaka and thrown for refuge among the Amakosa, by whom they were treated as bondsmen or as a sort of Helots, having claimed the protection of the British government, have been removed from their state of bondage and brought into the colony, where they have been located, to the number of 17,000 individuals, between the lower Keiskamma and Great Fish Rivers. The Fingoes are spoken very favourably of, and may become very useful colonists, and form an efficient border militia. (Account by Captain Alexander on the Caffre war, in the fifth volume of the *Journal of the Geographical Society*, 1835.)

There has been evidently of late years a pressure of tribes from the N. upon the southern Caffres, and it becomes an important question how the latter are to be assisted and protected against extermination or starvation. Hintza, the late Umkumkani or great chief of the Amakosa, finding that the Fingoes, weary of oppression, wished to place themselves under British protection, began to decimate them; and when Sir Benjamin D'Urban, the governor of the colony, remonstrated with him on this act of cruelty, Hintza replied, 'What is all this about? Cannot I kill my dogs if I choose?'

CASHMIRE, a region to the N. of Cabul, bounded on the N.E. by Cashgar; on the N. by Badakshan; on the N.W. by Koonduoz; and on the W. and S. by Cabul; its boundary to the E. is not defined, but is said to extend to the N. part of Cashmere. This region stands at a considerable elevation, and occupies a part of the Hindu Cosh Mountains, a name sometimes given to that part of the Himalaya chain which lies W. of the N.E. point of Cashmere. The height of one of the peaks of the Hindu Cosh Mountains has been stated at 20,493 feet, and on this and the heights connected with it, the snow remains throughout the summer, while the thermometer in the nearest valley stands at 113° Fahrenheit. There are no roads, properly speaking, the only travelling being along foot-tracks, which are frequently obstructed by rivers and mountain-streams, and these are crossed either by wooden bridges, or by swinging bridges made of the plant withes of trees.

No cultivation is carried forward on the hills, some of which are covered with pine forests, while others afford sustenance to numerous flocks of goats. The valleys are mostly of small extent but very fertile, and produce abundant crops of wheat and millet, with large quantities of grapes, which form an important object of cultivation. These valleys, besides, furnish pasturage for sheep and cattle.

The people, to whom the name of Caffres or infidels has been given by their Mohammedan neighbours, and hence the name of this region, Caffristan, have no general name by which they distinguish themselves, but are split into numerous tribes, each of which has a name peculiar to itself. The only accounts we have of their characters and habits are derived from the various tribes of Mohammedans by whom they are surrounded and with some or other of whom they are constantly at war. In their persons the Caffres are a fine race of people, with handsome features and fair complexions; the distinction made between different tribes, some of whom are called black Caffres, and others white Caffres, is derived from a peculiarity in the dress of the former, who dress themselves in black goat-skins with the hair outside, other tribes wear dresses made of white cotton.

As regards their civil government, it does not appear that

the Caffres acknowledge any general head, each tribe being governed in all things by its own rulers, and engaging at times in feuds with other tribes. Their hostile feelings towards their Mohammedan neighbours are probably engendered by the incursions which these are constantly making for the purpose of carrying off the Caffres as slaves: the captives thus made are mostly females, who are much sought after on account of their beauty. The hatred thus caused shows itself in many of the customs of the people of Caffristan. Once they shall have slain a Mohammedan the men go constantly bareheaded, but after this proof of prowess they wear turbans in which long feathers are placed, their number indicating the number of foreign enemies who have fallen by the hand of the wearer. The same information is conveyed by means of bells worn round the waist, their number being regulated in the like manner. A Caffre who has not slain a Mohammedan is besides not allowed to flourish his hatchet during the dance. Peace is sometimes made between the Caffre tribes and their neighbours, when they are ready to extend towards their former enemies all the rites of hospitality. Their warlike weapons are a bow about 4½ feet long and arrows of reed with barbed heads, which are sometimes poisoned. For closer conflict they are each provided with a dagger and a knife: recently they have begun to adopt the use of swords and muskets, in imitation of their enemies.

The Caffre villages are mostly built on the slopes of hills, the houses, which are made of wood, being placed one above another, the roof of the lower house forming a pathway to the one above it. One of these villages is said to contain 500 houses.

In their religion the Caffres are said to acknowledge only one supreme God, to whom they apply the name of Dagun, but they worship numerous idols, the representatives of great men of former times, and who are supposed to intercede with the Deity in favour of their worshippers. It is in agreement with this account that the idols of one tribe have no reputation for sanctity with the other tribes. It does not appear requisite for imparting this sanctity that any lengthened period must elapse after the death of a man so honoured, his contemporaries being willing to pay their worship to his effigy immediately after his decease. When he dies, the Caffre is dressed in his best clothes, and is placed upon a bier with his weapons beside him; his male relations then carry him about with singing and dancing, while the females give themselves up to lamentation, after which the body is inclosed in a sort of coffin and left in the open air, usually under the shade of a tree.

A Caffre man procures his wife by purchase, paying to her father sometimes as many as twenty head of cattle, or sheep and goats in proportion. Domestic slavery is practiced, the slaves being natives of Caffristan, sometimes taken in feuds with hostile tribes, and sometimes being orphans of their own tribe, it being not uncommon for the more powerful men to seize children who are unprotected, and either to sell them to some neighbouring country or to retain them in slavery.

The more usual food of the people is bread, cheese, butter, and milk: they likewise eat beef, mutton, and bears' flesh. They have a variety of fruits, among which are grapes, apricots, apples, almonds, and walnuts. They make three sorts of wine, viz., red and white, and a kind having nearly the consistency of jelly which is very strong: both males and females are said to drink occasionally to excess. The favourite amusement when they meet together is dancing: their music consists of a pipe and tabor.

Several dialects are spoken by the different tribes in Caffristan, but there are many words which are common to the whole people: the original language is supposed to have been derived from the Sanscrit. No estimate has been made of the numbers of the people. (Elphinstone's *Cabul*.)

CAGLIARI (the Roman *Caralis* or *Carales*), the principal town of Sardinia, and the residence of the *deeroy*, is in the south part of the island, on the fine bay of the same name, in 39° N. lat., and 9° 7' E. long. It is built partly on sea-side, and partly on the slope of a steep hill on the highest part of which is the castle, with the royal palace. The town is divided into four districts, *Castello*, *Stampace*, *Marina*, and *Villanova*. The population in 1825 was 27,380 (*Calendario Sardo*). Cagliari is an archbishop's see, which dates from the beginning of the fourth century. St. Lucifer was one of its earliest bishops. There is a university, with the four facul-

ties of theology, law, medicine, and philosophy, a belles lettres library of 15,000 volumes; a museum with good collections of minerals, birds of the island, and shells, including some of the Carthaginian period: a royal society of agriculture and public economy.

a diocesan seminary, a public and several elementary schools established since the nobility, and the cathedral, a large building, rich in marbles, built by the Pisans during their possession of the island. There are many other churches; ten convents of men, two of which are Scolo who keep public schools, and one of Ospedalieri, an hospital for the sick; and four convents of women, reale audienza or high judicial court for the south division of the island sits at Cagliari, as well as the commercial tribunal. The town enjoys great municipal privileges and revenues. The harbour is safe, and large ships find good anchorage in the bay. Cagliari is the chief port of Sardinia, and almost the only one frequented by foreign vessels. In 1831, 210 ships cleared out of the port of Cagliari, of which 159 were Sardinian, 20 Neapolitan, 10 Austrian, 6 French, 3 Swedish, 4 English, &c. Cagliari exports cheese, wine, oil, salt, flax, hides, and horses. The importation of foreign goods into Sardinia amounts to above four millions of francs annually. Near Cagliari are extensive saline works, in which salt is collected from the seawater. There is a royal manufactory of tobacco, the plant being cultivated in the north part of the island. Cagliari is the head town of an *intendenza* or province, which includes the southernmost part of the island, with a population of 112,000. It is bounded on the north by the province of Isili, on the north-east by that of Lanusei, and on the west by that of Iglesies. It is divided into four districts, Cagliari, Sinnai, Guasila, and Siliqua. The principal towns besides Cagliari are Quarto, about 5 miles east of Cagliari; population 5000: it is known for its Malmsey wine. There are several towns of between 2000 and 3000 inhabitants. The east and west districts of the province are mountainous, but the central tract north of Cagliari is a fine and rich plain called *Campidano*, watered by the Ulla and its affluents. The Ulla enters the sea west of Cagliari. The air of the plains is rather unwholesome in the summer months, especially to foreigners. A good carriage-road, lately finished, leads from Cagliari to Sassari and Porto Torres, through the whole length of the island.

CAGLIA'RI, PAOLO, called PAOLO VERONESE, from the place of his birth, was the most eminent master in what may be termed the ornamental style of painting. He was born at Verona, in the year 1532, according to Ridolfi, but more probably in 1530. His father, Gabriele Cagliari, was a sculptor, and originally intended his son for his own profession; but in consequence of the boy's determined preference for the sister art, he was placed under his uncle Antonio Badile, to be taught painting. He improved rapidly, and very early in life enjoyed an extensive and profitable patronage.

While yet young he visited Venice, where he was commissioned to execute some paintings in the church and sacristy of St. Sebastian. The pictures excited universal admiration, from the originality of the style and the vivacity of the design. Commissions for oil paintings poured in upon him, and a portion of the walls of the ducal palace was all to him for embellishment. From this time his fame and wealth increased rapidly.

He subsequently went to Rome; and in the course of his life visited numerous towns of his native country, in which he left behind him many lasting memorials. He was so well satisfied with his honours and emoluments at home, that he declined accepting the invitation of Philip II. to visit Spain, and contribute some works to the Escorial. He lived a life of uninterrupted labour and success, and died at Venice in the year 1588, leaving great wealth to his two sons, Gabriele and Carlo, who were also his pupils. They did not, however, attain their father's celebrity; and the young, the other abandoned painting for mercantile pursuits. Paolo had a brother, Benedetto Cagliari, who was a sculptor.

Paolo Veronese ranks among the greatest masters of the art, especially as a colourist. His colouring is less true to nature than Titian's, and less glowing in the tints; but it is rich and brilliant, and abounds in variety and pleasing contrasts. His style is florid and ornate, his invention easy and fertile, and his execution characterized by a masterly facility. His principal works are at Venice, but his productions are to be met with in most collections.

CAGLIOSTRO, ALEXANDER, commonly called **COUNT CAGLIOSTRO**, one of the most impudent and successful impostors of modern times. His real name was Joseph Balsamo, and he was born at Palermo on the 24th June, 1743. His friends selected him for the monastic profession, but during his novitiate he ran away from his convent, and thenceforward lived at his wife's and the credulity of mankind. The first exercise of his imposture, in a public way, was to forge tickets of admission to the theatres. He then proceeded to forge a will, and having robbed his uncle, and been accused of a murder besides, he was thrown into prison. He was liberated, again imprisoned, and again set free; but was finally obliged to fly from Sicily for cheating a goldsmith of a large sum of money under pretence of showing him a hidden treasure. He went successively to Alexandria, Rhodes, Malta, Naples, Rome, and Venice, at one of which places he married a woman whose great beauty and profound immorality were very useful to him.

Quitting Italy this couple visited Holstein, where Cagliostro professed alchemy, and thence they went to Russia, Poland, &c. In 1780 they fixed themselves at Strasburg, where the *not-disant* count practised as a physician, and attended to the art of making old women young. As his handsome wife, who was only twenty, vowed she was sixty, and had a son, a veteran captain in the Dutch service, they for a time obtained a good deal of practice among the old women of Strasburg. Thence they went to Paris, where Cagliostro exercised the profitable profession of Egyptian free-masonry (as he called it), and pretended to show people the ghost of any of their departed friends. In 1785 he was deeply implicated with the Cardinal Duke de Rohan in the notorious affair of the diamond necklace in which the name and fame of Marie Antoinette, the unfortunate queen of France, were committed. Cagliostro was in consequence, shut up for nine months in the Bastille, and on his expulsion from France he went to England, where, during a stay of two years, he found no lack of credulity. What took him again to Rome we know not, but in December, 1789, he was arrested in that city, imprisoned in the castle of Sant' Angelo, and after a long trial condemned to death for being a freemason. (See *Process*, &c., published at Rome—a very curious document). His severe sentence was commuted for perpetual imprisonment, and he was transferred to the fortress of San Leo, where he died in 1795. His wife was also arrested, and condemned to pass her life in a convent.

CAGNOLI, ANTONIO, born at Zante, September 29, 1743. He was attached to the Venetian embassy at Paris, and formed a taste for astronomy and an intimacy with Lalande. He built an observatory in the Rue Richelieu, and continued to make it useful till 1786, when he went to where he built another. This last was damaged by cannon-shot in 1797, but the owner was indemnified by General Bonaparte, who removed him to Modena. He was afterwards president of the Italian Society, and died at Verona about 1816. (We have found no further materials for his life: see Lalande, *Bibliog. Astron.* p. 599.)

Cagnoli wrote a work on trigonometry, first published at Verona in Italian (1786), and translated into French by Thompéré. The second edition of the translation bears 1808. Besides this he wrote various astronomical papers, chiefly in the memoirs of the Italian society, which should be consulted from the beginning to find them. The title of these memoirs is 'Memorie di Matematica e Fisica della Società Italiana, Modena,' quarto.

Cagnoli's trigonometry is one of those invaluable works which bring up the state of a science completely to the time at which it is written, and furnish those who want the means of application with varied stores of methods. Elementary writers on the practical parts of mathematics are among the last to adapt their rules to the actual state of science, unless somebody, who is well versed in the theory, performs the service which Cagnoli did for trigonometry. The consequence has been, that works on that art assumed a better form, and the constant reference been made to Cagnoli's treatise is the best of the with which it has been used. The late Professor Goodhouse, whose treatise on trigonometry has powerfully contributed to foster a taste for analysis in this country, seems, on a smaller scale, to have taken Cagnoli for his model. The work we speak of is a quarto of 500 pages of the French translation, the second edition of which is augmented by the author's communications, and treats very

largely of the applications of trigonometry to astronomy and geodesy.

CAHORS, a city in the south of France, capital of the department of Lot (population in 1832, 283,827), situated on the right bank of the river Lot, in a small peninsula formed by a bend in the course; 370 miles S. by W. of Paris, through Orléans, Châteauroux, and Limoges; 44° 27' N. lat., and 1° 26' or 1° 27' E. long.

Cahors is a very ancient place. Its name is variously written in the Greek and Latin authors. Ptolemy calls it *Ασθίωνα*, *Dueona*; in the Theodosian table it is *Bibona*; but Ausonius is considered by M. D'Anville to have given the true orthography—*Divona*, a word in the Celtic language denoting a fountain sacred to the gods. It was the capital of the Cadurei; and towards the close of the Roman dominion in Gaul assumed, according to the nomenclature then introduced, the name of the tribe to which it belonged; whence come the modern name of the town, Cahors, and that of the province, Quercy, of which it was for many centuries the capital. On the downfall of the Roman empire it came successively into the hands of Goths and Franks; was afterwards subject to the Counts of Toulouse, then to its own bishop; was taken by the English during their wars in France, and retaken from them; and carried by assault and pillaged in 1580, after a gallant resistance, by Henry IV., while as yet only king of Navarre and head of the Protestant party.

The town is situated partly on a rocky eminence, and has steep, narrow, crooked streets. The houses in what is called the upper town are commonly built with terraces commanding a wide prospect. There are few remarkable buildings: the cathedral is supposed to be the remains of an ancient temple, with the addition of a portico and other parts of modern date; the seminary for the priesthood is a fine and large building; the bishop's residence presents no point of interest. There are some Roman remains, the ruins of a theatre, and an aqueduct, and a monument to M. Lucterius, erected in the reign of Augustus Cæsar. There are two ancient bridges at Cahors, one on the W. side of the town, called Le Pont de Valendus, defended by some ancient fortifications; and another called Le Pont Notre Dame, so much decayed as to be impassable for carriages. We presume this to be the bridge on the S. of the town which in the large map of France by Messrs. Maraldi and Cassini is called Le Pont Vieux; the same map marks a third bridge, communicating with the Faubourg St. George on the other side of the river, E. of the town, called Le Pont Neuf, the name of which indicates a more modern origin. The ramparts form a public promenade; it is probably on a part of this called Le Fossé that a monument was erected in 1820 to the memory of Fénélon.

The population of Cahors in 1832 was 10,818 for the town, or 12,050 for the whole commune. The chief manufactures are woollen cloth, leather, and paper. The neighbourhood yields wheat and oats of good quality, but not sufficient for the consumption of the inhabitants; flax, hemp, and especially wine. The wine of the neighbourhood of Cahors combines deep colour with good flavour and strength; a great quantity is sent to Paris.

The town has a seminary for the priesthood, a college of high school, a library, a museum of natural history, and a theatre. Pope John XXII., a native of the town, founded here in 1321 a university, which continued to exist in the reign of Louis XV. Clement Marot, a poet of the sixteenth century, was born here.

The arrondissement of Cahors, one of the three into which the department is divided, contained in 1832 a population of 116,336. Cahors is the seat of a bishoprick, erected in A.D. 257, and now comprehending the department. The bishop is a suffragan of the archbishop of Alby.

CAICOS ISLANDS, one of the groups comprehended under the general name of Bahamas. They lie between 21° and 22° N. lat., and between 71° and 73° W. long., and, as is the case with all the groups belonging to the Bahama islands, on the E. and N. sides of a bank facing the Atlantic Ocean: the bank extends from the W. of them towards the West Indian Islands. When seen from the E. they appear low rocks; they consist of corals or madrepores, which are covered with a thin layer of sand, intermixed with shells, towards the W. they sink lower, till they reach mixtures with the moving sands of the bank. They are fertile, and produce a little cotton and provisions: the inhabitants do not exceed 1000. The Caicos are six in number, besides some

uninhabited rocks; **CAICOS**, Providenciales, N. Caicos, Great Caicos, E. Caicos, and East Harbour. There is anchorage near some of them; the best is at East Harbour.

CAIMACAN, a Turkish name which corresponds to our lieutenant or rather lieutenant governor. The caimacan of Constantinople is the lieutenant of the grand vizier, and is governor of the city. It is an office of importance, and the person who fills it is generally styled pacha. (*La Croix, Mémoires sur l'Empire Ottoman*.) The pachas or governors of provinces have also their caimacans or lieutenants, who often act as governors of the principal towns.

CAIMAN. [CROCODILE]

CA'IRA', literally 'It shall go on,' meaning that the revolution must proceed. This was the beginning and the burden of a song made by the more violent revolutionists about Paris, 1789 or 1790. The song went on denouncing death against the aristocrats, who were to be disposed of by being hung 'à la lanterne' (on the lamp-posts), which was actually done in several instances. When the wholesale massacres began in August and September, 1792, the 'Ca'ira' was the favourite song by which the murderers encouraged each other in their work of destruction. The tune was quick and hurried, and calculated to keep up popular frenzy. As a composition, the 'Ca'ira' was very inferior both in the words and the music to the 'Allons, enfants de la patrie' (the *Marseillais Hymn*), which was a lofty and heart-stirring appeal to all patriots for the defence of their country when attacked by the foreign powers. After the period of terror was over, the 'Ca'ira' became disused, and at last was forbidden to be played under Bonaparte, as an inauspicious memento of a sanguinary epoch.

CAIRN, or **CARN**, a heap of stones thrown together in a conical form. Lhuyd, in his 'Additions to Camden's Britannia in Radnorshire,' asserts that in the Cambro-Britannic, *Kaern* is a primitive word, appropriated to signify such heaps of stones. Cairns and tumuli of earth were the common monuments which the ancient Britons erected in honour of their great men. Which of the two kinds was to be adopted was probably determined by the circumstance of the country being stony or otherwise.

Pennant, in his 'Voyage to the Hebrides,' 1772 (4to. Lond. 1790, vol. ii. p. 208), speaking of the cairns, says, 'These immense accumulations of stones are the sepulchral protections of the heroes among the ancient natives of our islands: the stone chests, the repositories of the urns and ashes, are lodged in the earth beneath; sometimes one, sometimes more, are found thus deposited; and I have one instance of as many as seventeen of these stone chests being discovered under the same cairn. The learned have assigned other causes for these heaps of stones; have supposed them to have been, in times of inauguration, the places where the chieftain-elect stood to show himself to the best advantage to the people; or the place from whence judgment was pronounced; or to have been erected on the roadside in honour of Mercury; or to have been formed in memory of some solemn compact. (See Rowland's *Mona Antiqua*, p. 50; Borlase's *Antiq. of Cornwall*, p. 209.) These might have been the reasons, in some instances, where the evidences of stone chests and urns are wanting; but those generally are found to overthrow all other systems.

'These piles,' Pennant adds, 'may be justly supposed to have been proportioned in size to the rank of the person, or to his popularity: the people of a whole district assembled to show their respect to the deceased, and by an active honouring of his memory soon accumulated heaps equal to those that astonish us at this time. But these honours were not merely those of the day; as long as the memory of the deceased existed, not a passenger went by without adding a stone to the heap: they supposed it would be an honour to the dead, and acceptable to his *manes*. To this moment,' he continues, 'there is a proverbial expression among the highlanders allusive to the old practice: a suppliant will tell his patron, *Cyrr mi cloch er do charn* (I will add a stone to your cairn), meaning when you are no more I will do all possible honour to your memory.'

Jamieson, in his *Etymological Dictionary*, says, 'In Angus, where any person has been murdered, a cairn is erected on the spot.'

Pausanias (10, 6, 4) mentions monuments of collected stones, and in another (8, 13, 3) he speaks of similar monuments near persons who had fallen in battle.

CAIRNGORM, or

NGORM MOUNTAINS,

are situated in the Highlands of Scotland, to the N. of the central Grampians, between 57° 10' and 57° 20' N. lat., and 3° and 3° 20' W. long. They consist of enormous masses of rock, overtopped by several heights, and enclosing the lake of Avon. This lake, which is at an elevation of 1550 feet above the sea, is surrounded by steep and frigid precipices. The mountains Cairngorm and Ben-bainac rise almost perpendicularly from its N. and W. edges, and the vast masses of Ben Muc D'hu and of Ben-main overhang its southern shores, so that for several months in the winter the sun never shines on the surface of the lake. enormous rocks are without vegetation. No living creature is seen on their precipitous sides. The river Avon issues from the lake in a large stream, and flows through a deep, dark, and uninhabited glen. Sixteen miles from the lake the first habitations of men occur. These enormous masses are considered as constituting the highest land in Great Britain. Ben Muc D'hu, the highest of the summits, rises 4389 feet above the level of the sea, and is therefore higher than Ben Nevis. But there are still some doubts about their respective height. (Sir Thomas Dick Lauder's *Account of the Great Floods*; and McCulloch, *Highlands and Western Islands*.)

CAIRO. [KAHIRA.]

CAISSON. [COFFER-DAM.]

CAIUS. [GAIUS]

CAIUS.* Dr. JOHN, was born at Norwich, October 6, 1510. After receiving the first rudiments of learning in that city, he was sent to Gonville Hall, in the University of Cambridge; he took the degrees of B.A. and M.A. at the usual times, and was chosen Fellow of his college in 1533. His literary labours began at the age of twenty, by a translation into English of St. Chrysostom 'De Modo orandi Deum.' This was followed by a translation of Erasmus 'De vera Theologia,' which, he says, 'I dyd geue to master Augustine Stiward, alderman of Norwich, not in the full as the author made it, but abbreuiate for his only purpose to whom I sent it, leuying out many subtle things, made rather for great and learned diuines than for others.' His third production was a translation of Erasmus's paraphrase upon the epistle of St. Jude. His excuse for writing in English is curious enough: 'These I did in Englishe the rather because at that tyme men were not so geuen all to Englishe, but that they dyd fauoure and mayteine good learning contained in tongues and sciences, and did also study and apply diligently the same themselves. Therefore I thought no hurte done. Sence that time diuerse other thynges I haue written, but with entente neuer more to write in the Englishe tongue, partly because the commoditie of that which is so written passeth not the compasse of Englande, but remaineth enclosed within the seas,' &c. (*A Counseill against the Sweat*, fol. 4.)

It was probably soon after this that he travelled in where he remained several years. He studied med. Padua under Baptista Montanus and Vesalius, and took the degree of Doctor at Bologna. In 1542 he gave lectures at Padua on the Greek text of Aristotle, in conjunction with Realdus Columbus, the salary being paid by some noble Venetians. The following year he made the tour of Italy, visiting the most celebrated libraries, and collating MSS. in order to improve the text of Galen and Celsus. Then he attended the medical lectures of Matthæus Curtius, and then returned home through France and Germany. On his return he was incorporated Doctor of Physic at Cambridge, and practised with great distinction at Shrewsbury and Norwich. By the appointment of Henry VIII. he read lectures on anatomy to the Company of Surgeons; but he does not appear to have settled in London till a later period, when he was made physician to Edward VI. He retained his appointment under Mary and Elizabeth.

In 1547 Dr. Caius became a Fellow of the College of Physicians, and was ever a strenuous upholder of its right and interests. A difference having arisen between the physicians and surgeons in the reign of Elizabeth, as to whether the latter might administer internal remedies in cases where their manual assistance was required, Dr. Caius, then president, was summoned to appear before the lord mayor and

* His real name was Kaye, or Key, which is latinized by Caius. It is not a little singular that Shakespeare should have given the name of C. to a foolish French doctor in the 'Merry Wives of Windsor.' Farmer says that Shakespeare was little acquainted with literary history, and from his usual name, supposed Caius to have been a French gentleman of some acquaintance. It did not require any acquaintance with literary history to know that Caius had been a French physician in the times just preceding Elizabeth.

others of the Queen's delegates. On this occasion he pleaded the physicians' hands so ably, that although the surgeons were supported by the bishop of London and the Master of the Rolls, it was unanimously agreed by the commissioners that, in such cases, the surgeons should practise medically in such cases. Dr. Caius was president of the College of Physicians for more than seven years. He left behind him a book of the college annals, from 1555 to 1572, written with his own hand, in a clear Latin style. Having obtained permission from Queen Mary, with whom he was much in favour, to advance Gonville Hall into a college, which still bears his name, he accepted the Mastership of the college, and passed the last years of his life in it. That his retirement was not owing to any gloomy distaste to the world but to a fondness for learned leisure, appears from the numerous literary labours in which he was engaged to the last moments of his life. Before his death, he was reduced to a state of great weakness; and it appears from the following quaint passage in Dr. Mouffet's 'Health's Improvement, or Rules concerning Food,' that he attempted to sustain his flagging powers by reverting to the food of infancy. 'What made Dr. Caius in his last sickness so peevish and so full of frets at Cambridge, when he sucked one woman (whom I spare to name) froward of conditions and of bad diet; and, contrariwise, so quiet and well when he sucked another of contrary dispositions? Verily, the diversity of their milks and conditions, which being contrary one to the other, wrought also in him that sucked them contrary effects.'

Dr. Caius died July 29, 1573, in the sixty-third year of his age, and was buried in the chapel of his own college. His monument bears the pithy inscription 'Fui Caius.'

The most interesting of the works of Dr. Caius is his treatise on the sweating sickness. The original edition is a small black-letter and extremely scarce duodecimo of 39 folios, 'imprinted at London, by Richard Grafton, printer to the kynge's maiestie. Anno Do. 1552.' It is entitled 'A booke, or counsell against the disease commonly called the sweate, or sweating sickness. Made by Jhon Caius, doctour in phisicke.' This was intended for the public in general; but in 1556 the author published it in an enlarged form, and in the Latin language, under the title 'De Ephemerâ Britannicâ.' The epidemic described by Caius was that of 1551, the fifth and last of the kind. It was an intense fever, of which the crisis consisted in a profuse perspiration. The death of the patient often followed two or three hours after this symptom, but if he survived the first attack of the disease twenty-four hours, he was safe.

The works of Dr. Caius are exceedingly numerous, and display his talents as a critic, a linguist, a naturalist, and an antiquary, as well as a physician. The original works of Dr. Caius consist of treatises, 'De Medendi Methodo,' 'De Ephemerâ Britannicâ,' 'De Ephemerâ Britannicâ ad Populum Britannicum,' 'De Antiquitate Cantabrig. Academiarum,' 'De Historiâ Cantabrig. Academiarum,' 'De Canibus Britannicis,' 'De Rariorum Animalium atque Stirpium Historiâ,' 'De Symphonîâ Vocum Britannicarum,' 'De Thermis Britannicis,' 'De libris Galeni qui non extant,' 'De Antiquis Britannicis Uribus,' 'De Libris Propriis,' 'De Pronunciâ Græcæ et Latinæ Linguae cum Scriptione Novâ,' 'De Annalibus Collegii Medicinæ Lond.,' 'De Annalibus Collegii Gonvilli et Caii,' 'Compendium Erasmi Libri de Theologiâ.' He also edited, translated, and commented upon, many pieces of Hippocrates, Galen, and others.

Several of his treatises were re-printed, under the superintendence of Dr. Jebb, Lond. 1729, 8vo.; and his treatise 'De Ephemerâ Britannicâ' has been lately edited by Dr. J. F. C. Hecker, Berolini, 1833, 12mo.

In the present age, when the writings of the founders of the healing art are rarely studied, it is difficult to sympathize with the deep veneration of Caius for their opinions; yet it should never be forgotten that it is to such as he that we are indebted for that general diffusion of medical knowledge which has rendered the best parts of the practice of Hippocrates and Galen familiar to those who have never a line of their works; and that the great founder of Caius College was not only an able physician himself, but paved the way for the Heberdens, the Cullens, and the Hunters.

(Hutchinson's *Biographia Medica*; Aikin's *Biographical Memoirs of Medicine in Great Britain*; *The Schæfferia*, von Dr. J. F. C. Hecker.)

CAIUS COLLEGE, Cambridge, or more properly Gon-

ville and Caius College, was founded in 1348 by Edmund de Gonvill, rector of Terrington and Bushworth in Norfolk, who at the instance of Walter de Manny, one of the founders of the Order of the Garter, obtained a license for that purpose from Edward III.

Gonvill laid the foundation of his college on the spot (as Speed tells us) where the orchard of Corpus Christi College is now standing (1605), and dedicated it to the honour of the Annunciation of the Blessed Virgin; but dying before his intentions were fulfilled, he left a large sum of money to William Bateman, Bishop of Norwich, in trust for the completion of his building, and for the support of a master, four fellows, and twenty scholars. Bishop Bateman removed from the spot selected by Gonvill, and having purchased houses near to his own hall, erected on their site the new building which he called Gonvill Hall; and he increased its revenues by his own bounty. Mr. Dyer, on the authority of Dr. Caius, says that the bishop did not build, but confirmed the hall.

Various other benefactors added to its endowments, especially Dr. Perse, who founded six fellowships, and gave to the college the right of appointing the master of the free school, which he had established at Cambridge. Thus in 1557 there were, according to Speed, a master, twenty-two fellows, 'one conduct,' and forty-five scholars, with officers and servants of the foundation, and other students.

In 1557 Dr. John Caius, having rebuilt a large part of the college, erected the chapel, and endowed three additional fellowships and twenty scholarships, obtained from Philip and Mary leave to be a co-founder, and to change the name from Gonvill Hall to Gonville and Caius College.

The present establishment is as follows:—A master, twelve senior fellows, of whom three are of the original foundation, three of Dr. Caius's foundation, two of whom must be physicians, and all Norfolk men, and six of various founders, five of whom must be priests, and two of these must belong to the diocese of Norwich; eight junior fellows, one of whom must be a priest of the Norwich diocese—out of these the senior fellows are elected; six fellows of Dr. Perse's foundation, preference being given to scholars of Perse's Grammar School; three fellows of Mr. Wortley's foundation, one confined to part of Devon and one to Norfolk; making in all twenty-nine fellows: twenty-nine scholars, the aggregate revenue of whom is 1035*l.*; two of the scholarships are confined to students from Harrow School, and one to a student in chemistry. There are eight exhibitions, amounting together to 120*l.* per annum. Among the celebrated men educated in this college, may be enumerated Dr. Caius, the co-founder, Sir Thomas Graham, Bishop Jeremy Taylor, and Lord Chancellor Thurlow. The number of members resident and non-resident in 1835, according to the Cambridge Calendar, was 272. The annual value of the church livings in the patronage of this society amounts, according to the Ecclesiastical Returns (1835), to between 8000*l.* and 9000*l.* (Speed's *Chronicle*; Dyer's *History of Cambridge*; and the *Cambridge Calendar* of 1835.)

CAITHNESS. This county occupies the north-eastern extremity of Scotland. It is bounded on the west by Sutherlandshire; on every other side it is washed by the ocean. The coast-line presents numerous indentations or bays. On the north, where it is separated from the Orkneys by the Pentland Frith, the projections of the coast form two bold precipitous headlands; the one on the north-east, called Duncansby Head (58° 37' N. lat., 3° 1' W. long.), the other on the N.W., called Dunnet Head, 58° 40' N. lat., and the most northern point of Great Britain. Nearly in the centre of the strait or frith, between these two points, lies the Isle of Skroma, forming a portion of the shire. The mountain-range which separates the table-land of Sutherland from the plains of Caithness does not rise to a great elevation in its course from north to south, and within these limits it does not exhibit any remarkable summit. But it attains a mountain character in the southern parts of Caithness, where it turns to the east, forming two distinct and high ridges, of which the northern contains the Maiden Paps, with the high summit of M. Bann, rising about 2334 feet above the sea; and the southern terminates on the east coast with the Ord of Caithness, which advances into the sea.

The plain of Caithness, which lies between the ridge of the Maiden Paps, the Pentland Frith, and the mountains that bound the county of Caithness on the west, comprises about four-fifths of the county; but it is not a

perfect level. Where it borders on the mountains to the south it contains many small hills, which form nearly a continuous chain, terminating in the cape of Clyth Ness. North of this range the country extends in wide levels, covered with moors, and slopes gradually to the beds of the rivers. A few insulated hills are of moderate elevation. Some of the moors may be from 200 to 300 feet above the sea, and are not cultivated, but many parts of them afford pasture. Agriculture is confined to the large tracts of level land along the water-courses, and to the slopes of the elevated plains. These elevated moorlands sink lower towards the north-east, and terminate in a low plain between Sinclair Bay on the east coast, and Dunnet Bay on the north-west. From the innermost part of Dunnet Bay there extends a very low tract of land, covered with heath and rough grass, and about two miles wide, in a straight line to Keiss Castle on Sinclair Bay. It is hardly more than 30 feet above high-water mark in any part. North of this tract the peninsula enclosed between Sinclair and Dunnet Bays runs to the Pentland Frith, and terminates in Duncansby Head and Dunnet Head. The greater and more elevated part, which may be 100 feet above the sea, has a light sandy soil; but though it was long neglected it now contains a considerable amount of land under cultivation, which is daily and rapidly improving.

The extreme length of Caithness, by a line drawn from its south-west point to Duncansby Head, is 43 miles: the greatest breadth from east to west is about 30 miles. The county contains nine parishes, and a portion of a tenth, the remaining portion being in Sutherland.

Parishes.	Population in 1831.
Bower	1,615
Canisbay	2,364
Dunnet	1,906
Halkirk	2,847
Latherton	7,020
Olrick	1,146
Reay (part of)	1,868
Thurso, including the town	4,679
Watten	1,234
Wick, including the burgh	9,850
Total population	34,529

The population of the shire in 1801 was 22,609; in 1811, 23,419; in 1821, 30,238. Of the population under the census of 1831 there were 16,359 males, 18,170 females. The number of families was 6904, of which 3580 were chiefly employed in agriculture; 1487 in trade, manufactures, and handicraft; and 1837 were not included in these two classes. In the specification of males more than twenty years of age engaged in handicraft, &c., out of 2257 so employed there were 309 carpenters, 245 masons and wallers, 101 blacksmiths, 87 boat-builders, 69 fish-curers, 43 millers, 151 tailors, 268 shoe-makers, 88 publicans or inn-keepers, and 143 small shop-keepers.

The chief, and indeed the only town, with the exception of Thurso, is Wick, on the bay of Wick, on the east coast. It has increased considerably of late years: and Pultney town, which is situated on the opposite side of the harbour, and connected with Wick by a bridge, has been entirely built within the present century, on land held under lease by the British Fishery Society. The herring-fishery has given life and animation to the north-east coast of Scotland, whereas formerly there existed but little stimulus to industry. In Wick, which has a good harbour, and forms the greatest station in the north for the herring fishery, there are, during the summer months, usually from 1500 to 2000 boats stationed. Grain, wool, and the proceeds of the fishery are the principal exports, and furnish cargoes to a number of trading vessels; but there is no manufacture of any importance. Wick, along with Kirkwall, Dornoch, Dingwall, Tain, and Cromarty, returns one member to parliament.

Thurso is on the N. coast, about 20 miles N.W. of Wick. It lies in a valley or bay formed by Holburn Head and Dunnet Head. A stream, called Thurso Water, enters the bay close to the town. There is an anchorage, called Scrabster Roads, under Holburn Head; the coast to the west of this promontory is wild and rugged, the rocks being rent, and hollowed by the waves into caverns. A mass of rock, called the Glett, the resort of innumerable sea-fowl, is separated from the main-land near Thurso by a chasm. The family mansion of the late Sir John Sinclair is at Thurso; it was formerly a seat of the earls of Caithness; at a short

distance from it he erected a low circular building, surmounted by a sort of embattled parapet, which he intended should mark the grave of Harold, earl of Caithness, who was killed about this spot many centuries ago. It is a conspicuous object in a country comparatively barren and desolate. The parish of Thurso, owing to Sir John Sinclair's exertions, is the most improved district in Caithness.

The direct distance between Dunnet Head and Duncansby Head, the two points of the northern extremity of the peninsula, is about 13 miles. The small island of Stroms, which is about a mile in length, and half a mile in breadth, lies about 3 miles off the main-land. The navigation of the Pentland Frith is somewhat dangerous from the strength of the currents, and breakers or reefs. On the north side of Stroms there is a small vortex or whirlpool, named Swalchia, and nearer the main-land there are breakers, called the Merry Men of Mey, which are probably produced by a current setting strongly on a hidden reef. The tall white steeple of Canisbay, near Duncansby Head, serves as a land-mark; a light-house has been recently erected on Dunnet Head. The Stalks of Duncansby are two insulated columns of freestone, detached from the cliff, of which they originally formed a part; they are inhabited during the summer by thousands of aquatic birds. Duncansby Head, which rises to a considerable height, is characterized by Macculloch as being 'red, square, and ugly.' Near it is the ferry to the Orkneys, a village consisting of a few houses, and a place of entertainment, called the Houna Inn. What is termed John O'Groats' House is a piece of green turf on the east side of Duncansby Head, on which it is possible a house may have stood, but there has been no trace of one for many years.

The general appearance of Caithness is far from being attractive, but it hardly deserves the unqualified observation of Macculloch, who says, 'an uglier country than Caithness, from one end to the other, would not easily be found.' The cold winds which, during a great part of the year, sweep across the country from the north-east and north-west, stunt all vegetation; trees will not rise higher than the shelter which is afforded to them. But considerable improvements have been effected latterly; new roads have been formed; and should the herring-fishery on the east coast prove a permanent source of employment, it will tend to draw out the resources of the country.

Caithness returns one member to Parliament.

The county gives the title of earl to the family of Sinclair, which is descended from the St. Clairs of France. The earl of Caithness is lord-lieutenant of the county.

(*Physical and Political Geography of Great Britain* of the Society for the Diffusion of Useful Knowledge, Part IV.: Macculloch's *Highlands*, vol. II.: *Summer Rambles in the North Highlands*; *Boundary Reports, Scotland*; *Population Returns*.)

CAJEPUT. [MALALEUCA.]

CALABAR. OLD, a river of Africa, which falls into the Bight of Biafra, about 52 miles N. by W. of Fernando Po. It is the largest river on this coast, and forms an estuary 9 miles wide, which is full of shallows and sandbanks. Although so far to the eastward of that branch of the Quorra which has been traced to the sea, it appears to be one of the outlets of that great river, which it joins above Eboe town.

The principal place on the river is called Deka, or Ephraim Town, which stands on the eastern bank, about 20 miles from the entrance: slave-vessels and traders generally anchor off this place. This town is on elevated ground; the houses are mostly of clay, like those of the Eboe people, and are built without regularity along the banks of the river, which is here about a third of a mile wide. Although there is no established custom-house for the payment of duties, the chief is careful to exact a tax under the name of a present, without which no vessel is allowed to commence traffic. Twelve miles above Duke Town is another large village, called Creek Town.

The river is very winding, and the shores are low and swampy; the country is overrun with bushes, principally of the mangrove, and there are few cleared spots on the banks of the river. The right bank is much intersected by creeks, through which the natives assert they can in their canoes communicate with all the rivers that fall into the Gulf of Guinea between this and the Benin, forming the great delta of the Quorra. To the eastward of the Calabar is the high land of Camaroon. The canoes of the natives resemble

those of the *Indo* people, but are not so large. The river abounds in alligators, from 12 to 14 feet long: there are few fish. The water is not considered good, owing to the quantity of decayed animal and vegetable matter which it contains. It is high water at the entrance of the river at six o'clock: the rise is about six feet.

CALABAR, NEW, another river to the westward of the Old, and 52 miles east of Cape Formosa, empties itself into the same estuary with the Bonny. It is a wide but sluggish stream, with a bar across the entrance, which renders it accessible only for vessels drawing about 12 feet. Five miles up however there is an average depth of 30 feet. By the Portuguese it was called Rio Real, and it is evidently one of the branches of the Quorra. The town of New Calabar stands on an island formed by two branches of the river, and contains about 300 houses.

The commerce of these two rivers, as well as the others along this coast, consists in slaves, ivory, and palm-oil, which are bartered for Manchester goods, hardware, gum, and powder. Salt, which is made by evaporation from sea-water in large brass pans, is also an article of great trade with the interior.

The district to which the name of Calabar is given is very undefined and variable, as the chiefs are generally at war with each other, and overrun the neighbouring territories whenever they feel themselves sufficiently powerful. All this part of the African coast is low and swampy for 40 or 50 miles inland from the sea-coast, with few places fit for cultivation, though on these spots the soil yields plentifully not only yams, which are the chief food of the natives, but also the sugar-cane, and other tropical productions. Polygamy is customary among the natives, and human sacrifices are often made to propitiate good and evil spirits at funerals, and likewise periodically to the Spirit of the River, when the victims are carried out to the bar, and there thrown overboard to be devoured by the sharks. Every eighth day is a holiday, and is passed by both sexes in drinking palm-wine in a state of fermentation, till they become quite intoxicated.

CALABASH, a name given in the West Indies to the fruit of the tree called *Crescentia Cujete* by botanists.

CALABRIA, the S. part of the kingdom of Naples, extending from the borders of Basilicata, which are marked by the river *Treccina*, on the W. or Mediterranean side, and by the small river of Roseto on the E. side, about 40° S. lat. to Cape Spartivento at the extremity of the Italian peninsula, 37° 56' N. lat., a length of about 160 miles in a somewhat curved line. The country consists of two peninsulas of very nearly equal length, joined by a narrow neck only fourteen miles broad, between the Gulf of Squillace and Sant' Eufemia. The greatest breadth of the N. peninsula, from sea to sea, is about sixty miles, and that of the S. peninsula is in few places above thirty. The area of Calabria is computed by Neigebaur at 320½ German square miles, or about 7050 English square miles. Swinburne states the surface at 3,507,000 Neapolitan *moggia*, a land measure, about 7-8ths of an English acre. The population is stated by Neigebaur at 852,000: in Swinburne's time, sixty years ago, it was reckoned at 775,700.

The Apennines run through the whole length of Calabria, forming large and irregular masses, with numerous ramifications towards both seas, and occupying the greater part of the surface. In the N. the main ridge runs close to the Mediterranean coast as far as the river Savuto, S. of Cosenza, where it spreads eastward across the breadth of the peninsula, forming a mountain region of about thirty-five miles in length from W. to E., and twenty-five in breadth from N. to S. This region, which is called *La Sila*, is partly covered with forests and occupied by rich pastures, where the cattle and flocks are led from the lowlands during the summer. In these mountains the rivers Crati, Neto, Savuto, and many smaller streams have their rise. Near Nicastro, and between the sources of the *Lamato* and *Corace*, the ridge becomes narrow as it passes through the isthmus above mentioned; it then runs nearer to the E. coast, till towards the S. extremity of the peninsula it forms another large mass called *Aspromonte*, which fills nearly the whole width of the country above Reggio. The highest summits of Calabria do not exceed 5000 feet, except Monte Pollino on the borders of Basilicata, which rises to 7000 feet. The Calabrian Apennines are chiefly of limestone, but there are also tracts occupied by primitive rocks. A granitic ridge passes through the country, and rises to the height of several thousand

it appears chiefly at the S. end of the peninsula. Between the various masses and offsets are some extensive valleys along the banks of the principal rivers, which terminate in plains near the sea. The valleys of Cosenza and Monteleone, and the plain of Gioia, are the most extensive and fertile. The olive, the vine, the mulberry, and the orange and lemon tree grow luxuriantly. Calabria produces a variety of good wines, some of which keep very well for years. Silk and oil are the staple productions of the country. Manna is gathered in considerable quantity in several districts. The cotton tree is also cultivated, and the sugar cane has been tried and found to succeed.

Calabria is divided, for the purposes of administration, into three intendenze or provinces:—1. Calabria Citra, which extends from the borders of Basilicata to the river Savuto on the Mediterranean side, and the *Fiumenuto* S. of Cariati on the other. It includes four districts: Cosenza, Castrovillari, Rossano, and Paola. Towns: Cosenza, the capital of the province, and an archbishop's see, built on a hill at the confluence of the Crati and Busento, in a fine valley ornamented with country houses and hamlets, has a royal lyceum, population 9000; Acri, in the valley of the *Muccone*, another affluent of the Crati, pop. 7800; S. Giovanni à Fiore, in the valley of the *Neto*, rich in pasture, pop. 6200; Rossano, in a fruitful district near the sea, pop. 7000; Corigliano, a large town surrounded by olive and orange plantations, with a castle, and a fine aqueduct, pop. 6000; Cassano, in a romantic situation, with a handsome mansion of the Serra family, the owners of large estates in this district, and with cotton and silk manufactures, pop. 6000; Castrovillari, in the valley of the *Coscile* or *Sibari*, pop. 6000; Paola, a neat town of 5000 inhabitants, chiefly seafaring people, in the district of the same name, which is a narrow strip of land cultivated with great industry, and lying on the western slope of the Apennines down to the Mediterranean Sea, fifty-six miles long, with about forty small towns or villages along the coast; Amantea, a fortified town, pop. 3000; Cetraro and Diamante, on the same coast, where much wine is shipped; and Guardia, called also *Guardia Lombarda*, formerly a colony of the *Valdenses* from Piedmont, who were cruelly persecuted and extirpated in the sixteenth century. 2. Calabria Ultra II. extends S. of Calabria Citra, and as far as the river *Mesima* on the W. coast, and to a few miles N. of Cape Sila on the E. It contains four districts: Catanzaro, Cotrone, Nicastro, and Monteleone. Towns: Catanzaro, the capital of the province, in the valley of the *Corace*, a bishop's see, and the residence of the Upper Civil Court for all Calabria, has a secondary school or gymnasium, silk manufactures, and 12,000 inhabitants; Cotrone, the ancient *Croton*, a fortified town, with a small harbour, the only one on the E. coast of Calabria, pop. 4000. Near Cotrone is the *Capo della Colonna*, the ancient *Lacinium Promontorium*, with a single *Doric* column twenty-six feet high, the remains of the Temple of Juno; Squillace, the ancient *Scyllaceum*, a decayed town, with 2000 inhabitants; Nicastro, a straggling town, near the W. coast, 5000 inhabitants; Maida, a small town on the Gulf of St. Eufemia, known for the battle between the English and the French in 1806; Monteleone, a large wealthy town in a fertile district called '*Il Piano di Monteleone*,' gives the title of duke to a Neapolitan family, trades in silk and oil, has a royal college or lyceum, pop. 6000; Pizzo, where Joachim Murat landed, and was executed in October, 1815, pop. 5000, chiefly seafaring people; Mileto, Tropea, Nicotera, &c. 3. Calabria Ultra I., the most southern part of the peninsula, includes three districts, Reggio, Gerace, and Palmi. Towns: Reggio, the capital of the province, a thriving town in a delightful situation at the foot of the *Aspromonte*, and on the coast opposite to Sicily, an archbishop's see, has a royal lyceum, and a pop., including the suburbs, of 20,000. The country about Reggio, which is a strip of land between the Apennines and the sea, ten miles long and about four broad, with about fifty communes or villages, and 53,000 inhabitants, is one of the most fertile spots in Europe. It produces excellent wine, oil, fruits of every sort, especially lemons and oranges, of which essences are made, silk, &c. The produce of some parts of this land is of the annual value of 300 ducats (50*l.* sterling) the *moggio*, which is somewhat less than the English bushel. (Afan di Rivera, *Considerazioni sulle due Sicilie*, 183.) Rava, on a hill, near Cape Spartivento, pop. 9900. This part of the country contains many villages peopled by the descendants of Albanian and Egyptian colonists, who settled in Calabria in the time of the

They still retain some of their original customs and dialect. Greek names are common here, such as Pentimele, Valanidi, Malanidi, Polistena, all of which are villages in this part of Calabria; the river which flows near Polistena is called Jeropotamo. Gerace, the ancient Locri, now a bishop's see, has 6000 inhabitants. Near it are the Capo di Sileo, and the village of Pazzano, with a rich iron mine, the only one which is worked in the kingdom of Naples. Palmi, on the W. coast, a neat town with silk and woollen manufactures, and a considerable trade in oil, essences, &c., pop. 6000; Scilla, with a strong castle, and 4000 inhabitants, mostly engaged in the tunny fishery; Seminara, Bagnara, Gioja, are small towns near the same coast.

The extensive region now known by the name of Calabria, was in the Roman times chiefly occupied by the Brettii or Bruttii, whom some historians have represented as runaway slaves and outlaws, and others as a wild aboriginal race, living in the extensive forests which then extended over the greater part of the country. The E. coast was early colonized by Greeks, and became known, with the rest of the coast as far as Tarentum, by the general denomination of Megale Hellas or Magna Græcia. But the oldest name of the most southern peninsula of Calabria (that bounded on the N. by the Gulfs of Squillace and Eufemia) was Italia, a term which was afterwards extended to comprise the country as far as Tarento (Taras or Tarantum), and finally became the name of the whole peninsula of Italy. (Aristot. *Polit.* vii. 10.) The name of Calabria was given by the Greeks to quite a different country, namely, the N.E. coast of the Iapygian or Messapian peninsula, from Brundisium to Hydruntum; the Salentines occupied the S. part of the same peninsula. The name of Calabria, as applied to that part of Iapygia, continued in use under the Romans, and afterwards under the Byzantine emperors, as we find in Paulus Diaconus in the eighth century, and Luitprand of Cremona in the tenth, who both speak of Apulia and Calabria as one province, while they call the modern Calabria by the name of Bruttia, which by Constantine's division of the empire made one province with Lucania. How the name of Calabria came to be transferred to the country of the Bruttii is not clearly ascertained; but it would appear that the Byzantines having lost in the eleventh century the old Calabria, and still retaining several towns on the coast of the former Magna Græcia, transferred the name of the former province to their last remaining possessions in S. Italy. The first Norman conquerors took the title of Dukes of Apulia and Calabria. Under the Angevins, the presumptive heir to the throne was styled Duke of Calabria, which custom has continued to this day. A dreadful earthquake occurred in Calabria in 1783, which devastated the S. portion, and ruined many towns. (Serrao, *De' Terremoti di Calabria*, and other accounts of that epoch.) Calabria made a determined resistance against the French, first in 1799, when the Calabrians under Cardinal Ruffo reconquered the kingdom, and afterwards in 1806-7, when they waged a partizan warfare against the invaders. They were not ultimately subdued till 1810, when General Manhes armed one part of the population against the other, and by terror and bloodshed extirpated the malecontents. (For the atrocities of that period see Lieutenant Elmhirst's *Occurrences during Six Months' Residence in Calabria Ulterior*, 1809-10; *Recollections of Calabria*, by a French Officer; and Colletta, *Storia del Regno di Napoli*.)

The Calabrians are a proud, thoughtful, and warm-hearted, fiery race; having remained for centuries secluded from the rest of the world, and in a stationary social state, they have retained much of their peculiar character. They are personally brave and faithful to their word; are generally good marksmen, and make good soldiers under proper discipline. They have the reputation of being tenacious of purpose even unto obstinacy. Their dialect is different from the Neapolitan, and more resembles the Sicilian. The crimes which in former times were frequent in Calabria were the offspring of revenge and jealousy, excited and fostered by feudal abuses, a bad administration, and a vicious judicial system. Things are now changed for the better; murders are no longer frequent; and the banditti have disappeared. The higher orders are sensible, well informed, and hospitable. Keppel Craven, who has given the latest and best account of Calabria, speaks upon the whole favourably of the people:—Their demeanor was civil, but perfectly different from that of the natives of the other provinces of Naples: a look of inde-

pendence, not unmixed with melancholy! was observable in their countenances, and her respects an expression far from unpleasant. Most of their towns are built on conical hills, which they crown to the very top; the lower houses being joined together by thick walls constitute a kind of rampart. The women wear a body with the full shirt sleeves, and a thickly plaited petticoat of coarse cloth, and on the head a cloth folded like a napkin, as in other parts of the Neapolitan and Roman states. The men wear short jackets, and close hose, generally of black cloth, leather gaiters or coarse stockings, with shoes of undressed skin tied by thongs half way up the leg, sandal fashion. Their hats are conical and high, with hardly any brim to them. The principal deficiencies of Calabria are want of harbours along the coasts, and the malaria which prevails in most of the large valleys. By embanking the rivers and draining the marshes the atmosphere is gradually improving. The great carriage road from Naples, which has been continued to Reggio through the whole length of Calabria, with branch roads towards both seas, is another essential improvement.

CALAHORRA stands on an elevated plain, near the S. bank of the Ebro and the frontiers of Navarre, four leagues from Corella. It is the Calagurris, which in the year 682 of Rome sustained a memorable siege against Cneus Pompey, who at last took and destroyed the city, after an obstinate resistance and a most horrible famine, in which, according to Val. Maximus (vii. 6), even mothers fed upon their children, and men upon both. There remain only part of its strong walls and three towers, with its aqueducts and some other traces of ancient buildings. It is now an episcopal city of the *partido* (district) of Logroño, in the province of Soria, Old Castile; and its rich surrounding territory is called, in the Spanish style, *tierra de Calahorra*. It contains near 7000 inhabitants, a foundling hospital, an asylum for poor sexagenarian labourers, four tan-houses, some distilleries, and two olive-mills, besides many flour-mills on the Cidacos, which runs close to the cathedral. When this river and the Ebro, which join their waters half a league off, overflow the fields of Calahorra, the inhabitants are cut off from all potable water, owing to the wells and fountains being on the opposite side of the first stream.

This city gave birth to Quintilian, to St. John of the Cross, the reformer of the Carmelite order, and to Peter Garcia Carrero, physician to Philip IV., Professor of Alcalá, and author of the *Disputationes Medicæ*, *Commentarii in omnes libros Galeni*, and *De Locis Affectis*. 42° 15' N. lat., 2° 7' W. long.

CALAIS, a town and port of Franco, in the department of Pas de Calais, on the sea, 145 miles in a direct line N. or N. by W. of Paris, or 148 miles by the road through Beauvais and Abbeville, 157 miles through Clermont, Amiens, and Abbeville, 173 miles through Peronne, Arras, and St. Omer; in 50° 58' N. lat., and 1° 51' E. long.

Some writers have endeavoured to identify this town with the Portus Itius of Cæsar, but D'Anville considers that Witsand or Wissant between Calais and Boulogne has a better claim to be considered as the Portus Itius. Calais is chiefly known in history from the memorable siege or rather blockade of nearly a twelvemonth, which it endured from the English army under Edward III. in the year 1346-47, and from its remaining long in the possession of England. Upon its capture the French inhabitants were driven out, and English and other foreign settlers placed in the town, but after a year or two many of the French were readmitted to their former abode. Under the patronage of the English crown Calais became a thriving place, and the seat of a considerable trade in wool, which was drawn away from Middlebourg in Zealand. In 1558 it was retaken by the French after a short siege of a week, having been in the possession of the English above 200 years. It was subsequently taken by the Spaniards under the Archduke Albert, in 1596, but restored to France by the peace of Vervins, in 1598. When the archduke took the city he gave permission to the inhabitants to retire, if they thought right, to other parts of France; all did so except two families. The houses and goods were taken possession of and sold by the Spaniards. Upon the restoration of the town to France the inhabitants returned, and entered into an agreement to exclude from all magisterial offices the two families which had remained in the place, and their descendants. In 1657 the inhabitants with a weak garrison repulsed the Spaniards.

cakes. from what remains after the two fore-essences being run out and formed into round cakes, obtain hard portions of the fruit. According to other accounts, the finest sort is procured by exposing the fruits to the vapour of boiling water, and scraping off the soft resin as it exudes.

It is sent to Europe in several forms. 1. Dragon's blood in tears (sanguis D. in lachrymis); 2. Dragon's blood in as (S. D. in granis); 3. Dragon's blood in reeds (S. D. culis), in rods about 1 to 1½ feet long, about the thickness of the finger, covered with the fronds of the palm, wrapped round it with split branches. This is the best kind now met with in European commerce.

Many other kinds of dragon's blood are procured from different trees in various parts of the world, of which two only are worthy of notice:—1. Dragon's blood in masses, obtained both in the East Indies and Madeira by wounding the stem of the *Dracena Draco* (Linn.), occurs in large shapeless masses of a violet colour; 2. S. D. de Carthagea; American, or West Indian dragon's blood, obtained from the *Pterocarpus Draco* (Linn.). It occurs in pieces about 12 or 14 inches long, with a sharp angle on one side, partly wrapped up in the tendrils of a cissus and in leaves. Dragon's blood is a peculiar resinous colouring principle (*Draconia*), mixed with benzoic acid and other matters. It is insoluble in water, but easily soluble in alcohol, especially when boiling; it is also soluble in watery solutions of the caustic alkalis and forms with them a violet-coloured solution; it is less soluble in ethers and oils, but soluble in acetic acid; sulphuric acid chars it. Analysed by Herberger 100 parts yielded—

Fatty matter	2.00
Oxalate of lime	1.60
Phosphate of lime	3.70
Benzoic acid	3.00
Draconia	70.70

According to Herberger draconin is not an alkaloid, as Melandri thought, but a sub-acid.

Dragon's blood possesses no astringent properties, as was once supposed to be the case, owing to kino being confounded with it. It is now seldom used internally, but it is added to tooth-powders. It is however employed as a colouring matter and an ingredient in varnishes.

A spurious dragon's blood is often made with colophony, oil of turpentine, &c., coloured red with powdered Saunders-wood. Gum Senegal is also dyed red with tincture of Saunders-wood and passed for dragon's blood. The spurious is wrapped in the leaves of the Zea Mais or Indian corn.

Dragon's blood was known to the Greeks, and by them called *κινναβάρη*, *cinnabar*, a name which they also gave, as we now do, to a mineral, the red bisulphuret of mercury or *minium*.

CALAMY, EDMUND, B.D., of Pombroke Hall, Cambridge, was born in London, in 1600. He entered the university at the age of fifteen, and was honourably distinguished for his scholarship; but having incurred the resentment of the Arminian party by his opposition to their opinions, he was disappointed in obtaining a fellowship. His conduct, however, attracted the notice of the Bishop of Ely, Dr. Pelton, who made him his domestic chaplain, and gave him the living of Swaffham Prior, in Cambridgeshire.

His patron took the greatest interest in directing the studies of Mr. Calamy, who lived with the bishop till his death. Soon after this event, in 1626, he resigned his vicarage, having been appointed one of the lecturers of Bury St. Edmunds. For the ten years that he officiated in this capacity he ranked among the conformists, though of that class which was opposed to the measures of the high church party. When at length Bishop Wren's Articles were published, and the order for reading the 'Book of Sports' began to be enforced, he publicly declared his objections to them, and left the diocese. Thirty other clergymen did the same. Soon afterwards he was presented to the valuable rectory of

in Essex, where he had the prospect of living in peace, but this place, so agreeable to him in other respects, was unhealthy, and he brought on a quartan ague, from which he never perfectly recovered, and he was compelled to quit it. In 1639, being chosen minister of the church of St. Mary, Aldermanbury, he removed to the metropolis, being separated from the church, and openly avowed his attachment to the Presbyterian discipline. In the conten-

tious controversies of that period on the episcopal affairs, Mr. Calamy was a decided Presbyterian. His opinions against episcopacy were stated in a work, very popular in its day, entitled 'Short Annals,' written in answer to Bishop Hall's 'Divine Right of Episcopacy.' This composition was the work of five individuals, Mr. Marshall, E. Calamy, T. Young, M. Newcomer, and W. Spurstow, the initial letters of whose names were put together to form this singular title. As a preacher Mr. Calamy was greatly admired, and listened to by persons of the first distinction during the twenty years that he officiated in St. Mary's. His celebrity was so well established by his writings, as well as by the distinguished position that he occupied among the ministers in the House of Commons, he was one of the divines appointed by the House of Lords in 1641 to devise a plan for reconciling the differences which then divided the church, in relation to ecclesiastical discipline. This led to the Savoy conference, at which he appeared in support of some alterations in the Liturgy, and replied to the reasons urged against him by the episcopal divines.

Like most of the Presbyterian clergy, he was averse to the execution of the king, and to the usurpation of Cromwell; during whose ascendancy he held himself aloof from public affairs, resisted his proposition for a single government, and did not scruple to declare his attachment to the deposed prince. Accordingly he was among the foremost to encourage and promote the efforts that were made for the restoration of Charles. He strongly recommended it in a sermon preached before the House of Commons, on the day prior to that on which the House resolved to invite the king back to his kingdom; and he was one of those deputed to meet Charles in Holland with the congratulations of the nation. On his majesty's return, he appointed Mr. Calamy one of his chaplains; the duty of which office, owing to prevailing animosities, he performed no more than once. He was also offered the bishopric of Lichfield and Coventry, which it is thought he would have accepted, if he could have subscribed to the terms of the king's declaration. His moderation was such, that he appeared only desirous of removing those restrictions which affected the Presbyterian clergy, accompanied with such reforms in the services of the church as would have allowed a conscientious performance of their pastoral duties. But finding the temper of the high church party set upon their rejection by acts of further restraint and intolerance, he seized the opportunity of the passing of the Act of Uniformity to resign his living. Being well received at court, his friends recommended him to petition for an indulgence; but his request was fruitless. He did not, like some of the other ejected ministers, attempt to assemble a congregation elsewhere, but still continued to attend the church in which he had so long officiated. On one of these occasions, when no clergyman attended, some of his friends requested him to preach. After some hesitation he ascended the desk, from which it had always been his custom to deliver his discourses, and preached upon the concern of old Eli for the ark of God, into which he introduced some matter that touched upon recent events; which being deemed seditious, he was committed to Newgate, where he lay, until the outcry raised by his friends induced the king to order his liberation. He lived to see London in ashes; which event had such an effect upon his nerves, that he survived the melancholic spectacle little more than a month. He died Octob 1666. Mr. Calamy was considered an able theologian. His publications consist of single sermons preached on particular occasions, and a vindication of himself against an attack made upon him by Mr. Burton, entitled 'The Man's Ark, or a City of Refuge in the Day of stress.'

Two of Mr. Calamy's sons, who were educated at Cambridge for the church, took opposite sides on the disputed points of ecclesiastical affairs; the elder, Edmund, having, after his ejection from his living, become a decided non-conformist; while his other son, Dr. Benjamin Calamy, not only adhered to the high church party, but wrote in its defence 'A Discourse about a Scrupulous Conscience,' the tenour of which is, to stigmatise as crime the act of separating from the church.

A grandson of Mr. Calamy was a celebrated non-conformist divine, and is the well-known biographer of the ejected ministers; and also of Baxter's 'Life and Times.' This gentleman, also called Edmund, after his grandfather, on a visit to Scotland in 1709, receiv-

in divinity of the universities of Aberdeen, Edinburgh, and Glasgow. (Calamy's *Nonconformist's Memorial*.)

CALANDRA (*Clairville*), a genus of coleopterous insects belonging to the section Rhynchophora, and family Curculionidae. Technical characters:—antennae eight-jointed, articulated, and inserted behind the middle of the rostrum (i. e., towards the base), the six joints following the basal one are short, the apical joint forms a large knob, generally somewhat hatchet-shaped, having the apex soft and spongy; rostrum long, and slightly bent downwards; thorax rather long and depressed, narrower in front than behind; body somewhat depressed and pointed at the apex; elytra shorter than the abdomen; legs short, tibiae armed with spines; tarsi four-jointed, the penultimate joint bilobed.

The well-known corn-weevil (*C. granaria*), which commits so much havoc in our granaries, belongs to this genus; it is about one-sixth of an inch long, or rather less; of a pitchy red colour; the thorax is coarsely punctured, and the wing-cases are deeply striated; the striae are minutely punctured; the legs and antennae are red.

This little insect bores a hole into the grain with its proboscis, in which an egg is deposited; the egg turns to a little grub or larva, which devours the whole of the inside of the grain, leaving the husk entire. This quantity of food is just sufficient to mature the grub: it then turns to the pupa, and afterwards to the weevil, which easily breaks through the husk, and is then at liberty to proceed as its parent did. When wheat is suspected to contain these little weevils or their grubs, that which is affected may be easily discovered by throwing the whole into water; that which is good will sink, while the rest will float.

Another species of Calandra (*C. oryza*, L.) closely resembling the corn-weevil, from which however it may be distinguished by its having four red spots on its elytra, attacks the rice grain in the same way as the one above-mentioned does that of the wheat.

Calandra palmarum, an immense species, being about an inch and a half in length, lives during its larva state on the pith of the palms of South America.

It is of a dull, velvet-like black, and has the proboscis furnished with a brush of black hairs on the upper part near the apex.

The larva of this species, which is called by the natives the *ver palmiste*, is considered by them a great dainty.

CALANUS. [BRANCHIOPODA.]

CALANUS, an Indian philosopher of the sect called by the Greeks Gymnosophists, or naked philosophers. Alexander the Great, in the course of his Indian expedition, met with a body of these singular men, and, being desirous of speaking with them, he deputed Onesicritus to invite them to visit him. Dandamis, their chief, refused to go himself or to allow any of his followers to go, saying, that he was as much the son of Jupiter as Alexander, and that he wanted nothing from Alexander, but was quite satisfied with what he had. Calanus was the only one who could be prevailed upon, and, amidst the reproaches of his colleagues, he consented to accompany Alexander in his expedition. On arriving at Pasargada in Persia he fell ill. He had never been ill before, and would not now submit to be nursed or doctored, but insisted on being burnt. After many fruitless endeavours to dissuade him from his resolution, Alexander ordered a splendid pile to be raised, and a golden couch to be placed on it by Ptolemæus, son of Lagus. Calanus was driven in a carriage to the spot, crowned after the Indian fashion, and, chanting hymns to the gods in the Indian tongue, he mounted the pile, and laid himself down in the sight of the whole army, and continued motionless amidst the flames. As soon as the fire had been kindled, trumpets were sounded, and it is said that even the elephants joined the army in raising a war-shout in honour of Calanus. The various ornaments with which Alexander had ordered the pile to be decorated were distributed to those who were present. While Calanus was riding to the pile, Alexander asked him if he had any requests to make. He replied, 'No; I shall see you soon in Babylon.' Alexander died soon after in Babylon, B.C. 323. Calanus was in his 73rd year when he died. (Strabo, xv. 1; Arrian, vii.; Cio. *De Dio*, l. 23; Valer. Max. i. 8.)

CALAPPA (Zoology), a genus of brachyurous decapod crustaceans, separated by Fabricius, and formerly embracing the genus *Hepatus* of Latreille, though now restricted to the following form.

General character:—very similar to those of the crab (*Crab*) proper; third articulation of the pedipalpi (which are called [*Crab*].) terminated somewhat like a pointed hook: chelæ equal, very large, compressed, with their upper edge, which is notched or crested, very much elevated, and fitting exactly to the external border of the shell or carapace, so as to cover the entire region of the mouth: the rest of the feet short and simple: carapace short, convex, wider posteriorly than anteriorly, and forming, behind, a vaulted shield, under which the posterior legs are hidden when the animal is in a state of repose: eyes mounted on short pedicels, and at a short distance from each other.

The genus is well marked by the peculiarities of the shell and chelæ, with which last, as with a shield, the carapace cover the mouth and anterior parts, at the same time contracting up their feet beneath the posterior vaults of the shell, under whose hard protection their vulnerable parts are comparatively secured from the attacks of their enemies. They are called by the French *migrantes*, and also *coqs de mer*, from their crested chelæ, as well as *crabes honteux*, from their appearing to hide their heads and smaller limbs behind their large chelæ. Their geographical distribution is wide. The species are recorded as inhabiting the seas of the Indian Archipelago, and of New Holland; the Pacific and Atlantic oceans; the seas of South America, &c. The proximate form is found in the genus *Callinectes* of Leach. [ETHRA.]

We select as an example *Calappa granulata*, an inhabitant of the Mediterranean sea, and found, according to M. Risso, most frequently in the fissures of rocks near Nice, where these crabs reach to the depth of ninety feet. The same zoologist says, that the females deposit their eggs in summer; and that there is a variety whose shell is six-toothed posteriorly, and whose general colour is pale rose, with whitish feet and brown nails.

The following is Desmarest's description of *Calappa granulata*:—Carapace verrucose, marked with four longitudinal sutures, and having on each side before it begins to dilate seven teeth, three short and obtuse, and four more strong and pointed upon the borders of the enlarged part, with two other smaller ones entirely behind: front bidentated: colour, that of flesh sprinkled with spots of carmine red; length two inches and a half; breadth three inches, six lines, French.

[*Calappa granulata*.]

a, The crab with the limbs exerted. b, The right chela.

CALAS. [VOLTAIRE.]

CALATHIDIUM, a modern name for the various plants called Compositæ, the common name from the annex. It consists of a flattish or conical cellularous, with the exception of a receptacle, upon which a number of generally presents a compactly arranged, and its surface more or less transverse, except so far as the scars left by the flowers render it otherwise, or coarct: this property is or scales, named paleæ. Its margin celand, and hence kind with one or more rows of small leaves ground-form, being in close the flowers as within a cup. The larger crystals.

locate the localities

ture, and proportions of these scales often afford good generic characters. In reality, a calathidium is a short spike of inflorescence, the receptacle being the depressed axis, its palea bracts, and the external scales being other bracts in a more perfect state. The daisy, the dandelion, or the sunflower, offer illustrations of this form of inflorescence. (See *Lindley's Introduction to Botany*, second edition, page 133.)

CALATHUS (*Bonelli*), a genus of coleopterous insects of the section Geodeplagiæ, and family Harpalidæ. Technical characters:—body elongate, somewhat ovate, slightly pointed posteriorly; thorax wider behind than before: anterior tarsi with the three basal joints dilated in the males: claws dentate beneath: palpi with the terminal joint almost cylindrical, and truncated: labrum transverse, and slightly emarginated anteriorly.

Upwards of twenty species of this genus have been discovered, almost all of which are European; their general colouring is black or brown; one or two metallic-coloured species however are known. In England eight species have been enumerated, most of which are common: four species may be found under stones and rubbish in the neighbourhood of London; of these *C. risteloides* is exceedingly common, frequently being met with in pathways, &c.: it is about half an inch long, and of a black colour; the antennæ are pitchy black, with the basal joint red; the legs are black, and in some specimens red. The wood-cut here given of *C. latus* will enable the reader to form an idea of their general appearance: it is a very rare species in this country, and differs chiefly from the one above-mentioned in its greater width, and the thorax having the lateral margins of a reddish hue.

[*Calathus latus*]

CALATRAVA, on the south bank of the Guadiana, 21 miles from Toledo, known as the Oretum or Oria of the Oretani, under the Romans, was, in the middle ages, that strong-fortified town of La Mancha which, from its proximity to the Sierra Morena, the lofty barrier between Castile and Andalusia, became the key of the former, and the theatre of war in the 12th century, against the Moors of the latter province. It is now reduced to a single tower, with the appellation of Calatrava la Vieja (the Old), in contradistinction to the great convent (erected in 1214) of the military order of that name, three leagues from it, which is called Calatrava la Nueva (the New).

In 1158 Sancho II. of Castile and III. of Leon took the primitive town and gave it to the Templars. The Templars, who seemed unable to prevent its re-conquest by the Moors, returned it to the king. Diego Velazquez, a Cistercian monk, although sprung of high rank, persuaded Saint Raymond, the first abbot of Fitero, in Navarre, a monastery of the same order, to offer his order, with their numerous devoted followers, to King Sancho, who readily granted them.

Thus Calatrava was not only rescued from the hands of the Moors, but many of its new defenders became Cistercians, and the town was the scene of the excursions against its assailants. Raymond, afterwards the leading person, was so successful in his operations, that in the same year, 1158, he founded the military order of Calatrava, under the rule of Saint Benedict, and this order, which was so unhealthy to the Cistercian, That incorporation

it is. In 1639, by Aldermanbury, 1637. Innocent III. ratified it in

being separated from the church, the order, assisted by attachment to the Presbyterian discipline, when its defenders

retiring to Salvatierra, were named, for a short period, knights of that place.

Having at first retained the Cistercian habit, this military brotherhood soon shortened it, and made it more suitable to the field. Finally, they adopted a secular dress for common use, and one for ceremony, consisting of a mantle of white silk, tied with a cordon and tassels, like that of the Garter, but having on the left arm a cross floury embroidered gules, a description which those who are acquainted with the language of heraldry will fully comprehend.

This institution, says Mariana, gradually degenerated. In 1485 the joint sovereigns of Aragon and Castile, Ferdinand and Isabella, united, with the consent of Innocent VIII., the grand mastership of Calatrava to the crown. At last the rich and honourable commanderies, once the reward of illustrious warriors, were frequently bestowed on greedy and undeserving favourites. Eighty-three of those dignities, and eleven priories, yielding a most splendid total annual revenue, are the only traces of the long by-gone glory of a sort of patriotic crusaders, who acquired the title of 'the gallant order,' while the knights of Alcántara had only the aristocratic epithet of 'the noble,' and those of Santiago the boastful epithet of 'the rich.'

Don Gonzalez Yañez instituted in 1219 a religious order of Calatrava for ladies, whose badge was the same as that of the knights, only embroidered in the front of the dress.

CALCAR (*Dejean*), a genus of coleopterous insects, of the section Heteromera and family Tenebrionidæ. This genus is distinguished from the allied genera (*Hypophæus*, *Apis*, &c.) by having the body linear, the head emarginated anteriorly, and the three or four terminal joints of the antennæ nearly globular; the thorax is longer than broad, truncated anteriorly and posteriorly, and of nearly equal width throughout.

CALCAR, or spur in flowers, is a hollow projection from the base of a petal, and has usually a conical figure. It was called nectary by Linnæus, but it rarely secretes honey. Its use is unknown. The spurs of some orchidaceous plants are several inches long, and many times longer than the flowers to which they belong, hanging down like vegetable tails.

CALCAREOUS SPAR. Under this term it is usual to include only those varieties of carbonate of lime which occur in distinct individual crystals of the rhombohedral system, the name never being used to denote arragonite, or any crystals of carbonate of lime belonging to the prismatic system; nor is it usual to apply it to those more or less crystalline limestones of which marble is the purest variety, where each crystal is so imbedded in the mass as to have lost all individuality. In a word, these rocks are of such importance and interest, that they do not admit of our treating them as a mineralogical variety, but as masses formed by the aggregation of numerous crystals of it. These, therefore, will be found described under the heads LIMESTONES and MARBLE, while we shall here confine ourselves to the individual crystals of which the others are composed.

This substance presents us with one of the most interesting objects which can engage the attention of the mineralogist, not only on account of the important part it plays in the geological structure of the earth, being frequently almost the sole ingredient of beds of rock of great thickness and extent, produced at every geological epoch, but also from the beauty and diversity of its crystalline forms, and from the peculiarity of several of its physical properties. The study and a correct knowledge of this mineral species have also of late become of still greater importance, since the discovery of the principles of isomorphism, by which it is shown that it is the most perfectly developed individual of a very large class of the mineral salts of carbonic acid of which it may consequently be considered the type.

If any crystal of calc spar, whatever its form, be carefully examined, an appearance indicating a tendency in its substance to break or split in the direction of three planes symmetrical; related to the form may be perceived, and by a gentle blow the whole is readily reduced to fragments, each of which may, with a little care, be brought to the form of the rhombohedron represented in fig. 2, the faces of which are parallel to the three planes of cleavage above-mentioned. This, in the language of Haily, is the primitive form of calc spar, and represents, according to his theory, the shape of the ultimate molecules or atoms of carbonate of lime, by the aggregation of which, according to certain laws, its

various. Although this rhombohedron occurs rarely or never as an unbroken crystal of pure carbonate of lime, it is nevertheless the most convenient ground-form, to the axis of which the faces of all other crystals of this substance may be referred, and it is therefore selected for that purpose. These forms, although far exceeding in number those observed in any other mineral species, are however (omitting the regular hexagonal prism, *c*, and its terminal faces, *o*, *fig. 6*), but of two kinds, being either rhombohedrons, of which varieties are represented in *figs. 1, 2, 3, and 4*, or scalinohedrons, one of the most common of which is seen in *fig. 5*. Their relations to each other and their combinations have been developed principally by Haüy, Bournou, and Monteiro, by whom no less than 30 different rhombohedrons and 50 scalinohedrons have been distinguished. As might naturally be expected, the combinations resulting from so large a number of simple forms is exceedingly great, and Bournou, who has written a treatise of three thick volumes on this mineral and arragonite, has distinguished no less than 700 varieties of form. Of these 154 are described in the large work by Haüy, accompanied by very accurate drawings of each.

A general knowledge of the crystalline form of this mineral may however be easily obtained by acquiring a knowledge of the relation of the faces of the five simple forms and the hexagonal prism referred to above; as, in almost all the more ordinary combinations, the general feature of the crystal is produced by one of these. The *fig. 2*, which, as has been already stated, is considered as the ground-form, is a rhombohedron, the faces of which are inclined to each other in the terminal edges at $103^{\circ} 5'$. This form, though exceedingly rare in pure calcspar, is however the prevailing crystal in the nearly allied species produced by the combinations of the carbonates of lime and magnesia, as will be seen by referring to BITTERSAP and DOLOMITE. In determining the relations of any form, the position of the planes of this rhombohedron in reference to the other parts must first be fixed, and this is readily accomplished in every case, owing to cleavage planes running parallel to its faces. This being determined, all other rhombohedrons are at once divided into rhombohedrons of the first order, such as *fig. 4*, which have their faces situated as the faces of the ground-form, or into rhombohedrons of the second order, the faces of which are situated as the edges of the ground form, as is the case with *figs. 1 and 3*.

The rhombohedron *fig. 1*, which may thus be seen to belong to the second order, is readily recognized by having its faces *g* making the same angle with the vertical axis *A B* as the terminal edges of the ground-form, so that in a combination the terminal edge of the ground-form is truncated by the plane *g*. This rhombohedron, which is called the first obtuser, has the angles at the terminal edges $135^{\circ} 57'$, and has with the same breadth its vertical axis one-half that of the ground-form. It is one of the most common of the rhombohedrons, and is frequently found alone, but still more frequently in combination with the hexagonal prism, producing the form seen in *fig. 7*. It occurs frequently at Andreasberg in the Hartz, and in the mines of Derbyshire.

The rhombohedron *fig. 3*, is also of the second order, and is called the first obtuser: its terminal edges correspond with the long diagonals of the faces of the ground-form, and therefore with the same breadth, its vertical axis is double that of the other: the inclination of the faces at the terminal edges is $78^{\circ} 51'$. In combination with the ground-form, if the faces *f* predominate, the form *P* appears as truncations of the terminal edges; if *P* predominates, the faces of *f* produce truncations of the six lateral angles, the edges of intersection being parallel to the inclined diagonals of *P* for two faces, and with the horizontal one for the third.

The rhombohedron *fig. 4*, bears to *fig. 3* the same relation as this does to the ground-form, the terminal edges of the first corresponding with the inclined diagonal of the second: the inclination of the planes to each other in the terminal edges is $65^{\circ} 50'$.

Fig. 5 is one of the more common scalinohedrons, and is commonly known as the Dog's-tooth Calcspar, and is found frequently in Derbyshire and other localities. It bears a close connection with the rhombohedrons *P* and *m*, having the lateral edges of the first and terminal edges of the latter, so that in combination with the first the form *fig. 8* is produced, and with the second it forms a bevelment of the terminal edges: the inclinations of the faces in the ter-

minal edges are respectively $104^{\circ} 38'$, and $144^{\circ} 24'$. This form frequently occurs as twins, formed by two crystals growing on each other, their principal or vertical axes being in the same right line, and the two crystals so situated that the obtuser terminal edges of the one abut on those of the other, and the acuter on the acuter.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

Fig. 7.

Fig. 8.

This mineral may be recognized by its untruncated terminal edges parallel to the faces *P*: the specific gravity of the crystals is 2.721; and the hardness is in the same order as *fig. 3*, being situated between gyps and fluor spar, and is of itself colourless, but frequently occurs of various shades of yellow, green, red, brown, and even black, from the admixture of impurities. Its glance is vitreous, with the exception of the terminal face *o*, which generally presents mother-of-pearl lustre. It is usually more or less translucent, and when transparent produces in a remarkable degree the double refraction of light: this property is best seen in the varieties obtained from Iceland, and hence known as Iceland-spar, and occurs as the ground-form, being in fact merely broken fragments of other larger crystals.

It would be useless to attempt to enumerate the localities

where this crystal is found, it being a common ingredient of every mine. It is perhaps sufficient to state that the lead mines of Derbyshire and Cumberland, and of Andreasberg in the Harz, are noted as affording the most beautiful crystals, and the greatest diversity of forms.

CALCEDONY. [QUARTZ.]

CALCEOLARIA, a genus of very ornamental herbaceous or shrubby plants, belonging to the natural order Scrophulariaceæ. Its distinctive characters are, principally, the flowers being diandrous, with a two-lipped corolla, the lower lip of which is much larger than the upper, and inflated so as to resemble a bag. All the species are South American, and are confined either to the western side of the Cordilleras, or to the southern extremity of the continent and its adjacent islands: in Chili and the mountainous parts of Peru, they are so common as to give a peculiar appearance to the vegetation. Some of them are lowlanders; others inhabit the highest parts of the Andes in the districts just below the regions of lichens and mosses; and thus, if both their wide geographical distribution and the various elevations at which they occur are taken into account, they are exposed to every kind of climate between those of England and Barbary. On this account no certain rules for their treatment in gardens can be laid down with reference to the whole genus; but the Chilean species will require to be separated from the Peruvian or Patagonian in the practice of all good gardeners; as well as those which, like *C. arachnoidea*, are hardy, from such as require the protection of a green-house or frame in winter.

The greater part of the genus has yellow flowers, a few have purple ones, and here and there in nature species occur with the two colours intermixed, by the addition of spots of purple to the yellow ground colour, the latter changing the former to a deep rich brown. By intermixing artificially the two colours natural to the genus, a production of hybrid varieties has resulted, and some crosses of extraordinary beauty have been obtained, especially from *C. integrifolia*, *corymbosa*, *arachnoidea*, *Chiloensis*, *crenatiflora*, *viscosissima*, &c., all species that have been figured in the 'Botanical Register.' These species, being all Chilean, have given its character to the English mode of cultivation, which, as it is the most successful of all, we shall briefly explain from Mr. Plant's statement in the 'Horticultural Register,' vol. ii., p. 266. 'Seeds are to be sown in the summer sufficiently early to produce by the month of December good stout plants fit for blooming the following year. They are to be placed in pots, size No. 48, in an airy part of a green-house. As the roots appear at the hole in the bottom of the pots, the plants are to be successively shifted into larger pots, care being taken to disturb the roots as little as possible. Finally, by the beginning of March the plants will have acquired such a size, that they may be removed to pots, size No. 12. At this time great care should be taken to keep the plants well ventilated, and the soil just moist, without ever being saturated. At the end of April or beginning of May, the plants are to be removed to a cold frame for ten days or a fortnight, in order to harden them gradually. If they are to flower in pots, the size used is what we call peck-pots, and these should be well drained with potsherds according to the hardness of the pots, and afterwards filled with the following compost: viz., two parts of fully decomposed stable manure, one part of leaf or vegetable mould, and one part of fine white sand, or, in the absence of that, one part of sandy-peat. Mix these well together, and beat the compost fine, rubbing it through the hands to break the lumps; for this process will answer much better than sifting. This compost is suitable for *C. Youngii*, *farinosa*, *fusca*, *pieta*, *pieta pallida*, *Atkinsonii* and *Morrisonii*. The polyantha is, according to my taste, one of the most interesting of the yellow-flowering species; the individual flowers are not so large as some of the others, but the very elegant habit of the plant, and the profusion of flowers it bears, render it very striking. I had a plant of this sort, treated as above, in full flower last July, formed a complete cone two feet and a half high, with at least 500 blossoms of the full size at one time; but I find this, together with *C. Wheeleri*, *atrosanguinea*, *Hopeana*, *Youngii-pallida*, *Eysenckii*, *monstrosa*, *pulchella*, white and crimson, ochre and crimson, and cream and crimson, delights in a compost something different from that recommended for *C. Youngii*, &c. Instead of any vegetable mould, add to the dung and sand one-fourth part turfy loam, as free as possible from oxide of iron. To have any fine sorts in

flower late in the autumn, nothing more is necessary than, as soon as the terminal flowers of the principal racemes are got to the full size (I am supposing the plants to be blooming in pots during summer), to cut the entire branches down to within an inch of the surface. Then take off about an inch of soil, and replace with fresh compost, sifted; this will in general happen about the end of July. When this is done, place the plants in a cold frame where they can be sheltered from rains by a covering, and in about a month they will be fine, vigorous plants, producing plenty of flower-stems, which will flower in the green-house during October and November. The sorts best calculated for the second blooming are—*Calceolaria Youngii*, polyantha, *Youngii pallida*, *pieta*, *pieta pallida*, white and crimson, cream and crimson, ochre and crimson, *Wheeleri*, *farinosa*, *monstrosa*, *Atkinsonii*, *atrosanguinea*.'

CALCINATION. This chemical term is derived from *calx*, the Latin for quicklime, which, as well known, is prepared by the action of heat upon limestone: the old chemists, therefore, employed the word calcination to express any supposed analogous change; for example, when certain metals, as tin and zinc, are exposed to heat and air, they were said to be *calcined*, and the product was called a *calx*, as of tin or zinc.

It will be observed, therefore, that different operations were included in this term; first, the expulsion of carbonic acid, as when lime is prepared; secondly, the acquisition of oxygen when the metals are heated, and the results of the action of heat and air upon them were termed *calces*: thus calx of tin is now called oxide of tin.

The term calcination is yet employed to express the separation of the volatile from the more fixed parts of a body: thus bones which are heated till they become black are termed *burnt bones*; but when, by the further operation of heat, they become white, they are called *calcined bones*; so also we say calcined flints, calcined clay, sulphate of lime, &c. But what were formerly termed metallic calces or calcined metals are now described as metallic oxides.

CALCIPHYTÆ. [CORALLINES.]

CALCISPONGIA. [SPONGIA.]

CALCIUM, a peculiar metal, of which lime is the well-known oxide. It was first obtained by Davy, in 1808, by the action of voltaic electricity; he made chalk or carbonate of lime into a paste with water, and placing it on a plate of platinum, a cavity was made in the paste to receive a globule of mercury. The mercury was rendered negative and the platinum positive by means of a battery of about 100 double plates. In this way the lime being decomposed, its metal formed an amalgam with the mercury. This amalgam was distilled in glass tubes filled with the vapour of naphtha. In an experiment in which the greater part of the mercury was expelled, the tube broke whilst warm, air entered, the metal, which had the colour and lustre of silver, instantly took fire, and burnt, with an intense white light, into lime.

That calcium is a white combustible metal is nearly all that is known respecting it; but many of its compounds with other elements have been long known and extensively employed:—the first we shall mention is lime, resulting from the union of

Oxygen and calcium: these substances combine to form two compounds, viz. lime, or the protoxide of calcium, and the peroxide of calcium. It has just been mentioned that calcium and oxygen unite with great force of affinity, which of course prevents calcium from occurring in nature uncombined with this element. Lime has been known from the remotest antiquity, and is one of the most abundant and universally diffused substances in nature. It is never found pure, but always combined either with other earths, or more generally with acids, for example with carbonic acid in marble, chalk, limestone, and calcareous spar, and in the shells of fish and eggs of birds; with sulphuric acid it constitutes sulphate of lime, or gypsum; with phosphoric acid it forms animal bone; and with silica and other earths it enters into the composition of many minerals and precious stones.

Lime is easily obtained in a pure state: the carbonate or any limestone free from impurity is to be mixed with coal or charcoal and exposed to a strong heat; in this way the carbonic acid is expelled, and the lime, or oxide of calcium, remains: this is, in fact, the common process of lime-burning, and the product is frequently called quicklime. Lime is composed of

1 Equivalent calcium = 20
oxygen = 8

Equivalent = 28

The properties of lime are, that it is white, opaque, inodorous, and its taste is acrid and alkaline; its specific gravity is 2.3. It is fusible in the strongest furnaces; but it is said to have been fused by the oxyhydrogen blowpipe. By exposure to the air it attracts moisture and carbonic acid, and falls to powder. Lime has great affinity for water, and two compounds of them are formed; one is solid and called *hydrate of lime*; and the other is *lime-water*.

Hydrate of Lime, or, as it is usually called, *slaked lime*, to distinguish it from *quicklime*, is readily prepared by sprinkling this earth with water; it almost immediately heats, cracks, swells, and becomes powdery. During this operation part of the water is rendered solid and combines with the lime, while another portion is expelled in vapour, light as well as heat being evolved; indeed the degree of heat has been found sufficient to set fire to buildings in which lime has been accidentally exposed to water. Hydrate of lime is composed of

1 Equivalent of lime = 28
1 " water = 9

Equivalent = 37

Lime-water is easily prepared by adding the earth to water, but it is better to employ the hydrate for this purpose; and it is a curious circumstance, first noticed by Dr. Priestley, that cold water dissolves a larger quantity than hot: thus an imperial pint of boiling water dissolves only 6½ grains of lime, but at near 32° it takes up almost exactly 13½ grains. When lime-water prepared with cold water is heated to ebullition it deposits crystals of lime; but it does not part with any at common temperatures.

Lime-water has a disagreeable taste, and the alkaline property of turning vegetable yellows brown and blues green. When it is exposed to the air the lime speedily attracts carbonic acid, and pellicle after pellicle of carbonate of lime being formed, the whole of the lime is eventually precipitated: hence the necessity of keeping this solution out of the contact of the air.

Lime is employed for a vast number of purposes in common life, the arts, and manufactures. Among its most important applications are the making of mortar, and the amelioration of certain soils; it is extensively used also in soap-making, leather-dressing, dyeing, and for various medicinal purposes.

Peroxide of calcium was discovered by Thenard; he procured it by the gradual addition of lime-water to peroxide of hydrogen. Small brilliant scales are soon formed, but if much lime-water be added at once, then the peroxide of calcium is pulverulent; it is in the state of hydrate, and decomposes spontaneously, losing its excess of oxygen even when left under water, and also by drying in vacuo. It is composed of

1 Equivalent of calcium = 20
2 " oxygen = 16

Equivalent = 36

Neither azote nor hydrogen combines with calcium.

Chlorine and calcium form one chloride; the quantity of calcium hitherto obtained has been too small to admit of this compound being formed by direct action; several modes of combination may however be resorted to: thus when chlorine gas is passed over lime heated to redness in an earthen tube, oxygen is expelled and chloride of calcium remains. It is however more easily procured by saturating hydrochloric acid with lime, evaporating the solution to dryness, and exposing the residue to a red heat to expel the whole of the water. In this operation the hydrogen of the hydrochloric acid unites with the oxygen of the oxide of calcium; water is formed and expelled, while the metallic chloride remains.

The properties of chloride of calcium (formerly called *muriate of lime*) are, that it is colourless, possesses a crystalline appearance when broken, is inodorous, and has an extremely bitter saline taste. It is very deliquescent, and on account of this property it is frequently employed in chemical researches to separate water from gases in order to render them dry, and also to combine with this fluid and with alcohol in other cases. It fuses readily by heat, and while in this state and exposed to air a portion of

chlorine is expelled and lime is formed. Chloride of calcium, after being heated, shines in the dark, and was formerly called *Humbert's phosphorus*. It is composed of

1 Equivalent of chlorine = 36
1 " calcium = 20

Equivalent = 56

When a concentrated aqueous solution of this salt is suffered to cool, crystals are deposited which, like the anhydrous chloride, are extremely deliquescent. They consist of

1 Equivalent of chloride of calcium = 56
7 " water = 63

Equivalent = 119

These crystals are remarkable for the great degree of cold which they occasion when mixed with snow; but the anhydrous chloride dissolves in water with the extrication of heat.

A subchloride of calcium probably exists, but it is quite unimportant.

Bromide of calcium is obtained by passing the vapour of bromine over red hot lime: as in the case of the similar action of chlorine, oxygen is evolved and bromide of calcium formed. It is a colourless, bitter, deliquescent substance which readily dissolves in water, with the evolution of heat. The aqueous solution does not easily yield crystals, but they contain much water. Bromide of calcium is composed of

1 Equivalent of calcium = 20
1 " bromine = 78

Equivalent = 98

Carbon and calcium form no compound.

Sulphur and calcium may be made to unite in three proportions. The sulphuret or proto-sulphuret is obtained by mixing anhydrous sulphate of lime with one-fifth of its weight of powdered charcoal, and heating the mixture to whiteness for two hours in a covered crucible. It is a red-dish-white compound, which is but slightly soluble in water, and suffers but little change even when long kept in it. The aqueous solution is colourless, and has an alkaline and hepatic taste; when evaporated in vacuo, white crystals of the sulphuret are formed. When acted upon by hydrochloric acid, sulphuretted hydrogen gas is evolved. This sulphuret shines in the dark, and has been called *Canton's phosphorus*. It is composed of

1 Equivalent of calcium = 20
1 " sulphur = 16

Equivalent = 36

Bisulphuret of calcium is obtained by boiling, but not to saturation, hydrate of lime and sulphur in water. On cooling, yellow crystals are obtained, which are soluble in 100 times their weight of water at 60°, but much more so in boiling water. They consist of

1 Equivalent of calcium = 20
2 " sulphur = 32

Equivalent = 52

and contain about 43.5 per cent. of water. When lime and sulphur are boiled together in water, till sulphur ceases to be taken up, persulphuret of calcium is formed, consisting of

1 Equivalent of calcium = 20
5 " sulphur = 80

Equivalent = 60

This compound was some years ago proposed to be employed in bleaching; but at present we believe no such use is made of it.

Phosphorus and calcium constitute the phosphuret, and like all the binary compounds of this metal hitherto described, except the oxide, it is entirely an artificial product. It is prepared by heating lime in a glass matrass with a long neck by a spirit lamp, and throwing small pieces of phosphorus upon it. A mixture of phosphate of lime and phosphuret of calcium is procured, which is of a brown colour.

This phosphuret readily decomposes water and phosphuretted hydrogen gas is evolved, and when dissolved in

hydrochloric acid this gas is abundantly procured. It has not been analyzed.

Selenium and calcium may be combined by exposing a mixture of selenium and lime to heat a little below redness. The resulting selenuret is a brownish-black substance which has neither smell nor taste, and is insoluble in water; when heated to redness it loses selenium and selenuret of calcium is obtained. Crystals of this substance may be formed by preparing a solution of lime in hydroselenic acid and exposing it to the air. It is composed of

1 Equivalent of calcium	= 20
1 " selenium	= 40

Equivalent = 60

No compound of boron and calcium is known.

Fluorine and calcium occur largely in nature, in combination, and form *fluoride of calcium*, called by mineralogists fluor spar. [FLUOR SPAR.]

Cyanogen and calcium form a cyanuret which has been but slightly examined; it is obtained by saturating hydrocyanic acid with hydrate of lime. It exists only in solution; by evaporation it is converted into carbonate of lime and ammonia.

Acids and lime combine to form a numerous class of salts; of these the more important only will be described; two of them, viz. the carbonate and sulphate, occur in great plenty in almost every part of the earth; and the phosphate is more rarely met with.

Nitric acid and lime very readily combine and yield nitrate of lime. It may be formed either by adding lime or chalk to the nitric acid. A colourless solution is obtained which is extremely bitter, and by evaporation long prismatic crystals are formed which, like the anhydrous salt, are extremely deliquescent; these crystals dissolve in one-fourth of their weight of cold water, and in all proportions in boiling water; they are also very soluble in alcohol. Nitrate of lime is readily decomposed by heat; the residue gives a feeble light in the dark, and has been called *Baldern's Phosphorus*; it is stated to be composed of nitric oxide, nitrous acid, and lime; but when the heat is very long continued then pure lime is obtained. Nitrate of lime is formed of

1 Equivalent of nitric acid	= 54
1 " lime	= 28

Equivalent = 82

It is found in considerable quantity in the spring water of Stockholm; it is applied to no use.

Carbonic acid and lime form carbonate of lime. [CALCAREOUS SPAR.]

Carbonate of lime constitutes the greater part of all shells, and enters into the composition of bones; like sulphate of lime, it is found in most spring waters, held in solution by an excess of carbonic acid; and to this in part the hardness of water is owing.

Carbonate of lime is composed of

1 Equivalent of carbonic acid	= 22
1 " lime	= 28

Equivalent = 50

This compound may be artificially procured by several processes, as by passing carbonic acid gas into lime-water, or by adding an alkaline carbonate to a solution of any salt of lime in water. The precipitate is at first bulky, but in a short time settles so as to occupy comparatively little space. Carbonate of lime is insoluble in water, and decomposed by most acids with the evolution of carbonic acid gas. It is in various forms largely employed, as in lime-burning, glass-making, the reduction of iron, &c.

Sulphuric acid and lime form sulphate of lime, frequently called gypsum, selenite, and plaster of Paris. It occurs largely in the mineral kingdom.

Sulphate of lime may be prepared artificially by several processes, as by mixing a solution of chloride of calcium or of nitrate of lime with one of sulphate of soda, or with dilute sulphuric acid. A bulky colourless precipitate is obtained when the solutions are moderately strong, which is sulphate of lime. This salt is nearly tasteless; it requires nearly 462 times its weight of boiling water for solution, and it is nearly as soluble in cold water. It is insoluble in alcohol. It is met with in most river and especially in spring waters, and is one of the salts which imparts to them

the property called hardness. The air has no effect upon it; the artificial as well as the natural crystals contain water, and the salt is composed of

1 Equivalent of sulphuric acid	= 40
1 " lime	= 28
2 " water	= 18

Equivalent = 86

When heated, the water is expelled, but it has a great disposition to regain this water, and when it is made into a paste with water it becomes warm, and then a solid uniform mass in a few minutes. It is upon this property of losing water by heat and recombining with it by admixture with a small quantity that its use in taking casts, &c. depends. When sulphate of lime is exposed to a violent heat it melts, and yields an opaque vitreous globule. Sulphate of lime is not only used for taking casts, but occasionally as manure, or rather, probably, as a corrector of certain soils.

Oxalic acid and lime form oxalate of lime. This salt exists in the form of calcu; and also in certain plants. It is readily procured by adding either oxalic acid, or, which is better, oxalate of ammonia to a solution of a salt of lime. It is a white, extremely insoluble substance; it is dissolved by acids, and decomposed at a high temperature, and converted first into carbonate and afterwards pure lime. Oxalic acid and lime form so insoluble a compound, that they are used as tests of each other's presence.

Phosphoric acid and lime form several compounds, one of which occurs in nature. [APATITE.]

There are some other phosphates of lime: the neutral phosphate is prepared by adding a solution of phosphate of soda to one of chloride of calcium. A white powder, insoluble in water, but dissolved by acids, is precipitated. It is composed of

1 Equivalent of phosphoric acid	= 36
1 " lime	= 28

Equivalent = 64

Sesquiphosphate of lime is obtained by mixing a solution of phosphate of lime in phosphoric acid with alcohol. It is a white substance, which reddens litmus paper on account of the excess of acid; this excess is removed by water, and then the neutral phosphate remains. It is composed of

1½ Equivalent of phosphoric acid	= 54
1 " lime	= 28

Equivalent = 82

Biphosphate of lime is formed by digesting the neutral phosphate in phosphoric acid dissolved in hot water. By the evaporation the salt crystallises in small scales. Its taste is sour, and it attracts moisture from the air. The biphosphate is also obtained when the phosphate of bones is treated with sulphuric acid. It is composed of

2 Equivalents of phosphoric acid	= 72
1 " lime	= 28

Equivalent = 100

Subphosphate of lime of bones, obtained by calcining them to whiteness, is insoluble in water, but dissolved and partially decomposed by most acids. It is composed of

1½ Equivalent of phosphoric acid	= 54
2 " lime	= 56

Equivalent = 110

Chlorine and lime act upon each other in a peculiar manner, which is not as yet perfectly understood. When hydrate of lime is exposed to the gas it absorbs nearly one-third of its weight, and the resulting compound has been called a chloride, a chlorite, and a hypochlorite of lime. Although its exact nature has not been determined it is a most important compound, and is used to a great extent for the purposes of bleaching, and frequently called *bleaching powder*. In solution it is employed as a disinfectant. The general properties of the salts of lime are, that those which are neutral and soluble in water are not decomposed by ammonia; but if the solutions be moderately concentrated, potash and soda throw down lime, and the alkaline carbonates precipitate carbonate of lime. The soluble

salts of lime are all precipitated by oxalate of ammonia, unless an excess of acid be present, and then the precipitate is to a certain extent redissolved.

CALCULUS is the general term for inorganic concretions of various kinds, formed in various parts of the body, and bearing a general resemblance in shape or composition to stones. The particles of which they are composed are frequently arranged by peculiar chemical affinities into regular forms; and in these, as in other crystals, the process may begin around a fragment of some other substance, such as a clot of blood, a pellet of mucus, or some foreign body, lying loose in the fluid which holds the elements of the calculus in solution. They are also formed by the mechanical aggregation about a nucleus, or otherwise, of particles of different kinds accidentally thrown together, and cemented into a mass by glutinous animal matter: or, lastly, they may be the product of secretion: the more fluid part of the secreted matter being conveyed away or absorbed, while the sediment gradually thickens and hardens into consistence, adhering perhaps to some rough surface or projecting point, or being deposited in a hollow where the accumulation is least liable to be displaced by friction or washed away by the fresh influx of fluid.

Tartar of the Teeth.—The most familiar instance of the last-mentioned kind of concretion is that which is deposited from the saliva and mucus of the mouth between the teeth, and upon their outer surface next the cheek. This affection is not only productive of deformity, but of considerable injury to the teeth, which become loosened by the displacement and absorption of the gums under the increasing pressure of the mass. It may easily be prevented by a little attention in the use of the brush, or remedied by the operation of *scaling*, which gives no pain, and should never be postponed when it is necessary. The substance deposited is gritty, of a dirty yellow colour, and goes by the name of *tartar*, though it has no connection with the vegetable product so called. It is stated to consist of the phosphato and carbonate of lime.

Salivary Concretions.—Similar deposits, consisting nearly of the same materials, occur under the tongue or in the substance of the cheek in the ducts which convey the secretion of the salivary glands into the mouth. They sometimes attain a considerable size, and require an incision for their removal.

Pulmonary Concretions.—Hard irregular masses of phosphate of lime, rarely larger than an almond, are frequently met with in the lungs of consumptive patients. They are sometimes found imbedded in the pulmonary tissue, to which they adhere intimately; but more frequently in the middle of tubercular deposits, especially when these take place in the substance of the bronchial glands. They occasionally find their way by ulceration into the air-tubes, and are brought up by coughing.

Calcareous Concretions in the Blood-vessels and Heart.—Brittle earthy deposits, consisting chiefly of the phosphate of lime, are exceedingly common, especially in advanced life, in the arteries, and in the valves of the left side of the heart, the cavities of which contain arterial blood. They are formed at first in nodules or scales, behind the membrane which lines these parts internally, and sometimes accumulate to such an extent as to convert the arteries into rigid tubes, and to impede or even stop the motions of the heart. They are frequently the cause of *aneurism* and other serious diseases, particularly a kind of mortification of the extremities called *senile gangrene*, and that distressing complaint, *angina pectoris*, which is often found to arise from rigidity of the arteries which supply the heart itself with blood. These concretions are not, however, so often productive of mischief as might be expected; for scarcely an individual passes the middle period of life in whom this ossification of the arteries, as it is termed, does not exist in a greater or less degree. The veins are likewise subject, but much less frequently, to small corpuscular concretions called *phlebotithes* (from *φλέψ*, a vein, and *λίθος*, a stone). They appear to be formed behind the thin lining membrane, which, as they grow, is pushed forward into the calibre of the vessels, closing them in a kind of capsule, and forming a narrow pedicle by which they remain adherent. After a time they become detached and moveable. When they occur in the veins upon the surface of the body, they may be removed if troublesome; but they are not in general of any consequence, and are seldom larger than a very small pea. They are quite white, and consist of car-

bonate and phosphate of lime, combined with much animal matter.

Calcareous deposits are also found occasionally imbedded in the muscles (where however they partake more than in other situations of the fibrous nature of bones), on the surface of the spleen and pleura, in the brain, and other organs, and in various morbid growths of a cancerous, scrophulous, or fungous nature; as well as round foreign substances of any description retained in the body, and subject to the action of its fluids. They do not admit of classification, but all consist of combinations of lime with carbonic or phosphoric acid, and animal matter.

Chalk-stones.—Gouty and rheumatic persons are subject to the deposition of a matter thus denominated, and resembling half-dried mortar, under the skin, about the joints chiefly of the fingers and toes. They have been met with in severe and long-continued rheumatism of the head beneath the skin which covers the cartilage of the ear. They frequently excite ulceration, and when they protrude externally may be removed; but an operation is rarely resorted to. They are found to consist of *urate of soda*.

Intestinal calculi.—The bowels are sometimes obstructed by rounded masses formed by the agglutination of dry fibrous particles, such for instance as the fine down or beard of the oat, which is not entirely removed by sifting the meal. These concretions usually form round a small piece of bone, a plum-stone, or other such body. They are smooth and compact in their structure, but of small specific gravity: the fibrous matter of which they consist occasionally alternates with concentric laminæ of phosphate of lime, which usually forms a layer upon their surface. The circumstances which lead to their formation are obscure, but are possibly connected in some measure with constitutional predisposition, as they are found to recur habitually in the same person in spite of all precautions. The symptoms and most appropriate remedies for this complaint will readily suggest themselves; but its existence is in most cases rather suspected than ascertained till the calculus passes, as the symptoms may arise from other and very different causes of obstruction.

Gall-stones.—Calculi thus denominated are frequently found in the gall-bladder, or reservoir of the bile, which is attached to the liver, especially in persons who have reached the middle period of life, and have been long addicted to luxurious habits, or whose general health has been seriously impaired by mental distress or bodily ailment. They are often numerous, and one instance is recorded in which nearly three thousand were found at once. Generally however there are not more than three or four, and they are often solitary. They consist of one or more of the constituents of bile, with the occasional addition of phosphate of lime, and are white, or of shades intermediate between this colour, brownish yellow, and dark green. The white consist almost wholly of *cholesterine* (from *χολή*, bile, and *στερεός*, solid), a substance like spermaceæ, first detected in the bile by Chevreul. The intermediate shades are composed of this substance, with more or less admixture of bile; and the darker kind seem to consist entirely of bile itself inspissated. The last are rough and friable in their texture, sometimes much resembling cinders; the lighter varieties, on the contrary, are smooth and unctuous to the touch, presenting several surfaces apparently flattened by mutual pressure. They are moreover distinctly crystalline, and sometimes lamellated as if deposited in successive layers.

Biliary calculi are not productive of much inconvenience as long as they remain in the gall-bladder; but when they are protruded through the proper duct of that organ into the canal by which the bile passes from the liver into the intestine called the duodenum, they occasion great pain and disturbance of the health. The pain occurs in paroxysms, and is seated in the pit of the stomach, or a little lower and to the right, shooting to the back; and it is generally attended with vomiting and shivering, but not at first with a quickened pulse. If the bile be wholly obstructed, the evacuations lose their colour, and become unfrequent; the skin is tinged with a deep yellow, or *jaundiced*, as it is termed; rapid emaciation succeeds, with fever, and extreme dejection and weakness. The event is sometimes fatal, but in general the stone passes at length into the duodenum, the flow of bile is re-established, and the disturbance subsides. The best remedies are emetics, aperients, opium, the warm bath and fomentations, and occasionally bleeding.

Urinary Calculi.—The urine is a very complex fluid,

holding in solution at least twelve different ingredients in health, and more in disease. Some belong to the class of acids; of the uric, phosphoric, and oxalic; others are alkaline or earthy, as ammonia, soda, lime and magnesia. In certain conditions of the system these elements are no longer kept in complete solution, but are precipitated or combined in a solid form, constituting various kinds of crystalline or sedimentary deposits often arranged in successive layers; thus inducing those well-known affections, *gravel* and *stone in the bladder*.

Renal calculus and gravel.—Urinary concretions for the most part originate in the *pelvis* or hollow part of the kidney, either as small stones or in the form of minute sand-like crystals. In this situation they are called *renal calculi* (from *ren*, the kidney). They may remain there permanently, and even attain a considerable size, so as to distend the cavity and cause absorption of the gland itself, without more inconvenience than an occasional sense of weight and a dull aching in the loins. They may also produce inflammation and abscess of the kidney, which sometimes ends in the discharge of the stone with the other contents of the abscess through an ulcerated opening in the back, and sometimes in a lingering death. More commonly the deposit is carried with the urine while yet of small size or in the form of sand into the *ureter* or duct of the kidney, along which it descends more or less slowly into the bladder with symptoms much resembling those which attend the passing of a gall-stone. These are shivering, sickness of the stomach, pain shooting in paroxysms from the back to the groin, and down the thigh of the same side; and, in males, retraction of the corresponding testicle. The circulation does not partake in the disturbance unless the calculus be so large as to obstruct the ureter, and thereby excite inflammation of the kidney. These symptoms constitute what is called a *fit of the gravel*, and generally terminate in the expulsion of the offending matter with the urine, which is not effected without much pain in the neck of the bladder and the urethra; the urine being voided in small quantities and with difficulty, and occasionally mixed with blood. The remedies employed in gall-stone afford relief in a fit of gravel. Copious draughts of some mild warm fluid should also be taken, with small doses of alkaline or other medicines, suited to the nature of the deposit.

Vesical calculi.—It sometimes happens that a renal calculus, having reached the bladder in the manner described, is detained there and becomes the nucleus of fresh concretions. Vesical calculus may also be formed upon a foreign body, such as the broken end of a catheter, or upon a small stone which has made its way inwards. Nuclei of this last kind are formed originally in the ducts of the prostate gland, which surrounds the male urethra just where it issues from the bladder, and consist of phosphate of lime.

In whatever way it may first arise, *vesical calculus* or *stone in the bladder* is one of the most dreadful maladies to which man is exposed. Even in its nascent state, but most certainly when it becomes at all large, the stone occasions excruciating pain. This is seated chiefly in the neck of the bladder where the stone usually rests, and, by sympathy, in the urethra near its external orifice: it is attributable, in a great measure, to the strong spasmodic contractions of the bladder upon the stone, and is most severe immediately after micturition. Hence, fortunately, it is intermitting; for when the bladder is full, the weight of the stone is partly sustained by the fluid, and it does not touch the sensitive internal membrane in so many points. In some cases the pain is more endurable than in others from peculiarity of constitution, or the comparative smoothness and lightness of the stones; but sooner or later the period of agony arrives; the bladder becomes intolerant of the smallest amount of distension, so that the urine is voided, as it enters, drop by drop, mingled with blood and mucus; and at length the patient inevitably dies, worn out by unremitted suffering.

There are remedies which are capable of affording a certain amount of relief for a time; but the only means that offer even a chance of a happier termination than death itself, are the removal of the cause by an operation. The stone must either be withdrawn through the urethra by a properly constructed instrument, which often succeeds when it is small in the male, and seldom fails in the female unless it be large; or it must be drilled and crushed into fragments small enough to be voided with the urine, according to a brilliant method of operating lately brought into notice

[*LITHOTRITY*], or an incision must be made large enough to permit its extraction [*LITHOTOMY*]; a method practised by the ancients, and unfortunately by no means superseded (as some imagine) by lithotripsy, which is out of the question in very young children, and often inapplicable in more advanced life. This disease is curable by the various means that have been devised, or a combination of them, in perhaps five or six out of seven cases, even in its advanced stage; and the average number of failures in young children does not amount to one in fourteen. It is always advisable that an operation should not be delayed when the existence of stone is proved, which, it may be observed, can only be done by actually striking it audibly with a metallic instrument called a *sound*; for not only is the stone constantly increasing in size, but the parts concerned may become incurably diseased in consequence of delay, or the general health may sink beyond the power of restoration. The idea of dissolving the calculus is a dream.

It is a curious fact in the history of this disease, that exceedingly common in some places and very rare in others. Thus at Norwich and Paisley together, there are probably more cases in a year than in the whole of London; while at Hereford the disease is almost unknown. No researches into the cause of this difference have yet afforded a satisfactory explanation of it.

It would be tedious to enter at length into the chemical nature of urinary calculi. In weight they vary from a few grains even to several pounds, but seldom exceed a few ounces. They have been distinguished (chiefly by the labours of Dr. Wollaston) into the following kinds, which are here arranged nearly in the order of their frequency:—

1. Uric acid.
2. Oxalate of lime, called also the *mulberry calculus*, from its dark colour and rough surface.
3. Ammoniac-magnesian-phosphate; called also the triple-phosphate.
4. Phosphate of lime, or bone earth calculus.
5. The fusible calculus, a combination of the last two species; so called from its fusibility under the blow-pipe.
6. The mixed calculus; composed of several of the other kinds confusedly mixed.
7. Urate of ammonia.
8. Carbonate of lime.
9. Cystic oxide.
10. Xanthic oxide.

The three last are extremely rare. The phosphatic varieties generally include a nucleus of the first or second species, and are found chiefly in advanced life, or in cases of long standing.

The substance called uric acid, of which probably three fourths of the concretions in question consist wholly or in part, is sparingly soluble in water unless an alkali be present in a quantity more than sufficient to neutralize it; and from such a solution, of which healthy urine is an example, the addition of almost any other acid will precipitate either the salt of the alkali, or the uric acid itself in the form of powder. To this peculiarity is probably due the formation of chalkstones—consisting, as we have seen, of urate of soda—in those who are subject to gout, as well as the proverbial liability of such persons to gravel and other calculous disorders: for in this complaint acetic acid is so abundantly generated as to be observable in the perspiration. Children also, in whom the food is so apt to turn sour upon the stomach, are much more liable to stone than the middle-aged, and their calculi almost invariably consist of uric acid. In such cases the alkalies and absorbent earths are of eminent service, by preventing the admixture of free acid in the urine, which is thus rendered more capable of retaining the urates in solution. These medicines, on the other hand, are extremely injurious if the phosphates happen to prevail, when acids should take their place, for reasons somewhat analogous. These considerations may have their use in pointing out the propriety of attending to the diet and the digestive functions, with a view to prevent or correct the formation of urinary concretions; and they no less forcibly illustrate the necessity of a knowledge of chemistry on the part of those who are intrusted with the treatment of such disorders, that the different kinds may be justly discriminated. This can only be done by a careful analysis of the urine and its sediments; a process which will be explained in the article on URINE.

CALCULI IN INFERIOR ANIMALS.—*Vesical calculi* are rare in the horse and the deer, for these animals have no

gall-bladder, and the hepatic duct is large and straight, and the bile flows through it as fast as it is secreted. They are often found in the gall-bladder of the ox, sheep, and dog. There is scarcely a stall-fed ox slaughtered from Michaelmas to Lady-day in which they do not exist of large size, or in great numbers: sometimes there is only one concretion, but that of considerable magnitude. In an ox that died of jaundice, a gall-stone was found which weighed 15 oz. when first removed from the bladder. More frequently there are numerous calculi of a small size, scarcely larger than grains of sand, or many of them agglomerated together, forming rounded or irregular balls, from the size of a pin's head to that of a millet seed. More than 800 have been counted in the gall-bladder of one beast. Occasionally there is found an irregular crystallized body of a green or azure blue colour, glistening and polished. This forms a valuable pigment. The cause of these concretions is not well understood, but it depends greatly on want of exercise and impaired digestion. In the grass-fed ox they are seldom found. These calculi may exist in the gall-bladder without apparent injury to the health, but occasionally they press upon and close the passage through which the gall should be conveyed to the intestinal canal; or they enter into the hepatic duct and obstruct it, and prevent the flow of the bile through it; or, being numerous and large, they may, by their presence and weight and friction, irritate the mucous membrane of the cyst, and thus be productive of disease. [BILE, DIGESTION, and JAUNDICE.] If the existence of inspissated bile, or biliary calculi, in the gall-bladder were indicated by a certain train of symptoms, the experience of the farmer would supply a ready and almost certain cure. The stall-fed ox has the gall-bladder partially filled with minute or larger concretions. The grass-fed beast in June will rarely furnish one. The former was idle and over fed; the latter was compelled to exert himself a little in order to obtain his food, and he was kept under the salutary aperient influence of the newly-sprung grass.

Biliary calculi have been observed in the gall-bladder of almost every domestic quadruped, and very often in poultry. They differ materially in their composition, but agree in being crystallized bodies, formed of layer upon layer, and containing margaritic acid, animal mucus, a yellow colouring matter, and salts, principally phosphate of lime and magnesia.

Cerebral Calculi have been found more frequently in the horse than in any other quadruped. They are contained in the ventricles of the cerebrum or the cerebellum, and attached to or enveloped by the plexus choroides. They are usually white, variously formed, of a stony hardness, and consist nearly of pure phosphate of lime. No peculiar symptom indicates the existence of the calculus, but the horse is suddenly attacked by inflammation of the brain and dies; upon examination the ventricles are found distended with fluid, and these concretions attached to the plexus of vessels. Afterwards, perhaps, it is recollected that the animal had been somewhat dull and stupid, sleepy, and self-willed, and had frequently hung his head; that, in fact, there had been something wrong about the head. The irritation produced by the foreign body had been long existing and increasing.

Gastric Calculi are rarely or never found in the stomach of the horse; but they are of frequent occurrence in ruminants. Concretions varying from the weight of a few ounces to seven or eight pounds have been found in the paunch of cattle. There are traces of concentric layers in all of them, but they are far from being regular. There is usually some central nucleus, such as a small bit of nail or stone, around which has been collected a mass of earth and food and hair, cemented by the mucus of the stomach. When loose in the rumen, they acquire a globular form, but, having been confined in one of the compartments of that viscus, they are occasionally flattened, and in a few cases angular. The symptoms by which their presence is indicated are not well known, nor the effects which they produce; but one thing of some importance is certain, namely, that they are seldom found in healthy and thriving cattle. They may be either the cause or the consequence of disease, and much may be said on both sides. The method by which they may be dissolved, or otherwise got rid of is unknown. A different kind of concretion is found in the abomasum or fourth stomach of the ruminant, and particularly of calves. It is composed almost wholly of hair, agglutinated by the mucus of the stomach. They are frequently observed to spend a

considerable time in the friendly office of licking each other, a portion of the hair mixed with the saliva is occasionally swallowed; and, not possessing sufficient solidity or weight to break through the roof of the paunch and enter that stomach, it passes along the oesophagean canal to the fourth stomach, where, by the peristaltic motion of that stomach, it is formed into a ball. There are no symptoms which clearly indicate the presence of these balls, nor is it plain by what means they could be expelled; but it is very evident that they have an injurious effect, producing distension of the paunch and loss of digestive power in the fourth stomach; the first by sympathy, and the latter by their direct presence. The animals in which these hair-balls are found after death were never well conditioned or healthy, and those that have expelled a hair-ball by stool have immediately begun to thrive.

Similar balls, but composed of felted wool with portions of different kinds of food and various earthy and saline matters, mixed up with the mucus of the stomach, and having undergone a process of crystallization, are found in the fourth stomach of the sheep, the goat, the chamois, the antelope, and the deer. They have usually a small nucleus, but the structure of the surrounding mass and the form of the whole admit of much variety. [BEZOARS.]

Intestinal Calculi are often found in the horse. They have almost invariably some central nucleus, as a seed, a small stone, or a bit of nail, around which particles of food and saline matters have accumulated and crystallized. They differ from the gastric calculi in the greater portion of earthy and saline matter of which they are composed, and scarcely a trace of food is detected in many of them. The concentric layers are well defined, and the ball, when dried, will bear a beautiful polish. They assume different forms according to the portion of intestine which they occupy. In the colon they adapt themselves to the shape of the cells of that viscus, and represent a kind of four-sided prism: at the fundus, or base of the cæcum, they are globular. Twenty or thirty of the cells of the colon will sometimes be occupied by them, varying in weight from half an ounce to three-quarters of a pound. In the cæcum, a single concretion has occasionally weighed eight or ten pounds.

They are oftenest found in heavy horses of slow work. Mill-horses are also subject to them, and horses that are fed on much dry bran. The symptoms of their existence are obscure, and can scarcely be distinguished from those of colic. They have occasionally been expelled in the act of purging, but it would generally be a fruitless and a dangerous attempt to dislodge them, for they are embedded in the cells of the colon or the blind pouch of the cæcum. They destroy the horse by the irritation which they occasion, and by their weight, and especially in the concussion of rapid action, they rupture the parietes of the intestine. It would seem almost incredible that they should remain so long as those of larger size must necessarily do. Many months or years must have passed away in the formation of a calculus that ultimately weighs eight pounds. There is scarcely a case in which they have occasioned the death of the animal, where careful inquiry will not elucidate the fact that during a very long time the animal had experienced occasional attacks of apparent colic.

Salivary Calculi are oftener found in the herbivorous animal than in the human being, because there is a greater expenditure of saliva in mastication, and the salivary glands are larger and more susceptible of inflammation. They mostly exist in the parotid duct. They are of a dead white colour, usually of an oblong form, of considerable density and specific gravity, and the surfaces highly polished or capable of being so. They are only injurious when they completely obstruct the duct; then the salivary fluid, continuing to be secreted, accumulates behind the calculus, and the canal becomes distended, and will burst, unless an incision is made upon the calculus, and the obstructing body removed.

The salivary calculus of the horse consists of 86 parts of carbonate of lime, 6 of animal matter, 4 of water, 3 of phosphate of lime and other salts, and 1 of mucous matter.

Urinary Calculi. These, whether found in the kidneys, or ureters, or bladder, or urethra, have been observed in almost every domesticated animal. In the horse, a urinary calculus has occupied the whole cavity of the kidney and has weighed more than a pound. It has obstructed the ureters, and destroyed the horse and the ox: it has completely filled the bladder of the dog, and has been

shivered into a thousand pieces by the sudden fall of the animal from a considerable height. In the urethra also it has been productive of fatal inflammation in the dog. In almost every animal said has occasionally occupied the fundus of the bladder. Minute leuæ have been found in almost countless numbers, or one large calculus has produced extreme pain, suppression of urine, and destructive inflammation. In most of these cases means have been found to allay to a certain degree the irritability of the bladder, but no medicine has the slightest solvent power on the calculus. The operation of lithotomy has been performed with success on almost every domesticated quadruped, and that of lithotripsy has been effectual in the horse.

Nearly the same constituent principles enter into the composition of these calculi in the herbivorous animals. The carbonate of lime prevails: there are, on an average, 83 parts out of 100 of it in the urinary calculus of the horse; 87 in that of the ox, and 91 in that of the ass; the remainder is made up of subphosphate of lime and animal cement. In the hog, however, ammoniacal phosphate of magnesia is, with the animal cement, nearly the sole material. In none of them has uric acid been detected.

The concretions which are found in other tissues and organs differ little from those in the human being.

CALCULUS, CALCULATION. The word *calculus* means a small pebble, such as was made use of in teaching or practising calculation. We must refer to articles of a more specific kind for different methods of calculation, but as regards this individual word, we have only to draw the distinction between it and *mathematics*. Generally speaking, a calculator is taken for a mathematician; which he may or may not be. Mathematicians are sometimes fond of and skilful in calculation, and sometimes the reverse of both: Euler and Wallis are instances of the former; Lagrange, according to report, of the latter. To perform a calculation is to put numbers together by rules, the reasons of which may or may not be understood by him who uses them. It is true that a mathematician must, in the process by which he becomes such, increase his power of calculation; but whether he will ever attain the expertness and correctness of a banker's clerk in the commonest operation depends upon qualities of mind which have little or nothing to do with his mathematical power. It is necessary to caution our readers not to take a result as *mathematically* correct, because it is produced by a skilful calculator; or as *numerically* correct, because it has been worked by a good mathematician. The method of the first, and the work of the second, may be wrong without any inference against either in relation to his peculiar pursuit.

The term *calculus* is commonly applied to signify any branch of mathematics which may involve or lead to calculation: any, in fact, except pure geometry. Thus the part of algebra which relates to exponents and logarithms is sometimes called the exponential *calculus*. The references immediately following are to those branches which, without any particular reason, have permanently acquired the name of *calculus*. And the word being now completely introduced, every new specific development of any part of mathematics will receive the name. Thus the calculus of definite integral, the calculus of discontinuous functions, &c., are terms which are beginning to be used.

CALCULUS, DIFFERENTIAL. [DIFFERENTIAL CALCULUS.]

CALCULUS, INTEGRAL. [INTEGRAL CALCULUS.]

CALCULUS OF VARIATIONS. [VARIATIONS, CALCULUS OF.]

CALCULUS OF FUNCTIONS. [FUNCTIONS, CALCULUS OF.]

CALCUTTA, the capital city of Bengal, and the seat of the supreme government in British India, is situated on the left or east side of the Hoogly, in 22° 23' N. lat., and 88° 28' E. long.; about 100 miles from the sea.

In the beginning of the last century Calcutta was only an insignificant village, inhabited by native husbandmen; and a great part of its present site was completely covered with jungle. The spot appears to have been ill chosen as regards salubrity. The proximity of the low, damp, and dreary region of the Sunderbunds, a woody tract containing eight mouths of the Ganges, is necessarily unfavourable in this respect; and the healthiness of the city is still further impaired by a dense forest on the east, and some extensive mud-flakes on the south. The English have done some-

thing to this evil by properly draining off the surface-water near the town, and by filling up several stagnant ponds, as well as by clearing away the surrounding jungle to a considerable extent, but the air is still considered far from healthy.

In 1698 the English factory was removed from Hoogly to this spot, then occupied by the village of Govindpore, but the progress of the city was at first so slow, that in 1756 there were not more than 70 houses in it occupied by Europeans. An attempt had been made in 1742 to defend the place from the incursions of the Maharattas by surrounding it with a ditch, a precaution which availed but little against the attack in June, 1756, by Suraja ud Dowlah, the soubahdar or viceroy of Bengal. On the occasion of this attack the factory was deserted by the governor, the commandant, and many other of the European functionaries and residents. On the capture of the place, the English who had remained to defend the factory were thrust into a small unwholesome dungeon called the Black Hole, and of 146 individuals who were thus shut up at night only 23 were found alive in the morning. In the beginning of the following year, a squadron consisting of five ships of war, accompanied by 2400 troops under the command of Colonel Clive, arrived in the Ganges from Madras, and re-took the town of Calcutta, from which the garrison of the soubahdar retired, after an attack of only two hours' duration.

The citadel, to which the name of Fort William was given, was constructed by Clive soon after the battle of Plassey, fought in June, 1757. This fort stands on the bank of the Hoogly, about a quarter of a mile below the city. Its form is octagonal; five of the sides, which are towards the land, are regular, and three, which front the river, have their lines varied according to local circumstances. Fort William is the most regularly constructed fortress in India. The works are low, and there are but few buildings within the walls, which are so extensive, that it is said 10,000 men would be required to man them properly in case of attack; it is computed to have cost in its construction altogether two millions sterling. Its principal batteries are towards the river, from which side only an attack is to be apprehended.

The space between the fort and the city, called the Esplanade, contains the government-house, built by the Marquess Wellesley, which is the finest building in Calcutta: it consists of a centre with four wings, one at each corner, connected together by circular passages. The centre building contains two very fine rooms. The lower of these, the hall, is paved with marble, and supported by Doric columns; over this is the ball-room, supported by Ionic pillars. The private apartments, the council-room and other offices are contained in the wings. On a line with this building is a range of magnificent dwelling-houses with spacious verandahs.

The town extends for four miles and a half in the direction of the river; it varies in breadth considerably in different parts, the average being one mile and a half. The parts in which Europeans reside are mostly occupied by handsome detached houses, built of brick and stuccoed with lime, which gives them the appearance of marble palaces. The principal square measures 1500 feet on each side, and in the middle has a large tank, from which the square takes its name. This tank, which is 60 feet deep, is surrounded by a wall and balustrade, and has steps on the inside reaching to the bottom. During the administration of Lord Hastings large sums were expended in improving the ventilation of Calcutta; a street sixty feet wide was opened through the centre in its longest diameter, and several squares were made, which, like the one already described, have each a tank in the middle surrounded by planted walks. A quay, called the Strand, between two and three miles long, was formed, which extends upon the river-bank along the city. This quay is forty feet above low-water mark, and is furnished with many ghauts, or broad flights of steps, which are useful for the landing of goods, and for the accommodation of the natives in making the frequent ablutions prescribed by their religion.

The principal public buildings, besides the government-house, are the town-hall, the courts of justice, two churches for Episcopalian Protestants, and one for Scotch Presbyterians, besides Catholic chapels, a Greek and an Armenian church, several Hindu pagodas and Mohammedan mosques, and a Seik temple. On the south side of the town are an hospital and a gaol. The quarter in which the natives principally reside is to the north, and consists of narrow

dirty, unpaved streets: this quarter offers a complete contrast to the parts occupied by Europeans. There are a few brick houses of two stories, with flat terraced roofs, in this part, which is called the Black Town, but the far greater part of the dwellings are mud hovels, covered with small tiles, the walls frequently consisting of mats and bamboos, from which circumstance fires are of frequent occurrence. This quarter swarms with population. The total number of inhabitants in the city and suburbs has been estimated at 625,000. In 1819 the School Society reckoned the native population alone at 750,000, but as the limits comprehended in their computations were not defined, it is not possible to come to any certain result on the subject. So long ago as 1802 an opinion was expressed by the police magistrates, that, including with Calcutta a circuit of twenty miles, the number of inhabitants amounted to 2,225,000 souls. This number is probably wide of the truth; but there can be no doubt that the whole of the district comprehended within the described limit is very densely peopled. About one-third of the native inhabitants of Calcutta are Mohammedans, and nearly all the remainder are Hindus. The number of Christians was stated in 1822 to be 13,138, since which time that part of the population has probably increased. There are besides a few Chinese, Armenians, and professors of other systems of faith which prevail in different parts of the continent of India.

With so large a population, Calcutta presents at all times an animated scene. It was ascertained a few years ago, by means of persons stationed in various quarters for the purpose, that the number who daily enter the city from the suburbs and from the opposite side of the river amounts to upwards of 100,000 persons. The great mass of the population speak the Bengali language; and many, including the servants attending upon Europeans, speak the Hindustanee also.

The botanic garden, a splendid establishment of the East India Company, is situated on the west side of the Hooghly, where that river takes a bend, to which the name of Garden Reach has been given. Above this garden is an extensive plantation of teak, which wood does not occur naturally in this part of India. The introduction of this species of tree is considered desirable, as ship-building forms an important branch of industry. On the west bank of the river, both above and below as well as opposite to the city, there are several private yards for that purpose.

The soil in and about Calcutta is so deficient in water, that, after boring to the depth of 110 feet, no springs have been found. Many trunks of trees have been discovered 60 feet under the surface, standing erect, with their roots and branches perfect. Thin strata of coal and blue clay have been met with between 50 and 60 feet below the surface.

The external trade of the province of Bengal being almost wholly carried on at Calcutta, its nature and amount have been given in our description of the province [BENGAL]. The river is a full mile wide at high water, and trading vessels of the largest size ascend as high as the town.

The attention of strangers is much excited on first visiting Calcutta, by the number of vultures, kites, crows, and a species of crane, which, from its stately walk, has received the name of Adjutant [ADJUTANT]. These birds clear away the surplus food provided for Europeans, which is thrown at night into the streets, as it cannot be kept in that climate, and there are few poor persons to consume it whose religious prejudices will allow of their doing so. These scavengers are assisted by numerous foxes, jackals, and wild dogs, who enter the city at night for the purpose from the neighbouring jungles, and whose mingled howlings produce a very unpleasant effect.

The markets are abundantly supplied with game, meat, fish, vegetables, and fruits, the whole of which are sold at moderate prices. The game consists of wild-ducks, teal, ortolans, quails, hares, and venison. Among the fish is one—the mango fish—which is described as a great luxury: it has derived its name from the fact of its appearing in the river only at the season when the mangoes ripen. Fruits are furnished in an infinite variety, and of delicious flavour; pine-apples, melons, mangoes, oranges, guavas, peaches, loquats, and strawberries, are among the more usual descriptions.

The European residents have established several institutions for literary, scientific, and educational objects. The Asiatic Society, formed by Sir William Jones, was founded at Calcutta in 1784 [ASIATIC SOCIETY]. Among

the institutions for promoting education are the college of Fort William, a government establishment for the instruction of young men who have been partially educated in the college at Haileybury. A Sanskrit college, a Mohammedan college, and an Anglo-Indian college, are likewise supported by the government, which also gives assistance to many private institutions for instructing the children of natives and of the poorer classes of Europeans. The residents of Calcutta support a variety of charitable institutions and of societies for religious objects.

Calcutta is the seat of the supreme court of judicature for the presidency of Bengal. This court is under the control of a chief justice and two puisne judges appointed by the king. The courts of Sudder Dewanny Adawlut, and Nazamut Adawlut, established in Calcutta, the first for civil, the last for criminal causes, are courts of appeal from the provincial courts in all parts of India.

In 1814 a bishop's see was erected within the Company's dominions in India; the bishop, under the title of Bishop of Calcutta, has his residence in that city; his salary was fixed by act of parliament at 5000*l.* per annum.

The travelling distances measured in English miles from Calcutta to several of the chief places in India are as follows:—Agra, 839; Allahabad, 544; Ahmedabad, 1234; Amednuggur, 1119; Aracan, 475; Arcot, 1070; Ava, 1150; Bahar, 297; Balasore, 141; Baroach, 1220; Bareilly, 895; Bednore, 1290; Benares, 460; Bombay, 1301; Buxar, 408; Cabul, 1761; Candahar, 1781; Chertore, 1063; Comorin Cape, 1470; Dacca, 177; Delhi, 956; Ganjam, 369; Guallior, 805; Hyderabad, 902; Juggernaut, 311; Lahore, 1342; Lucknow, 649; Madras, 1030; Mirzapore, 493; Monghair, 275; Mooltan, 1450; Moorshedabad, 118; Mysore, 1178; Nagpore, 722; Nagpore (Little), 280; Oude, 562; Patna, 340; Pondicherry, 1130; Poonah, 1208; Semungapatam, 1170; Silhet, 325; Sumbulpore, 438; Surat, 1238; Tanjore, 1235; Trichinopoly, 1238; and Vizagapatam, 557.

CALDARA. [CARAVAGGIO.]

CALDAIUM. [BATH.]

CALDER, one of the rivers of Yorkshire, rises in the high grounds on the borders of Lancashire, in a marsh in Chigger Dean, S.E. of Burnley; and from the same marsh rises a branch of the West Calder, which runs in an opposite direction, and joins the Ribbles. The course of the Yorkshire Calder is easterly, through the deep valley of Todmorden; at Sowerby the river passes within two miles of Halifax, and by Dewsbury and Wakefield, at which latter place it is crossed by a bridge of nine arches. From Wakefield the course of the Calder is nearly N.E. to Castleford, near Pontefract, where it joins the Aire, which enters the Ouse five miles from Smithy. At Sowerby, about three miles S.W. of Halifax, the Calder receives a considerable brook from Ripponden, five and a half miles S.W. of Halifax. A little below Salterthwaite, about two miles S.W. of Halifax, its volume is increased by the Hebble, a small but rapid stream, which rises above Oveland, and passes round the north and east sides of the town of Halifax, and a few miles farther east the Calder receives the river Coln, which rises near Holm Moss, and runs past Huddersfield.

The Calder is an important feature in the canal system of Yorkshire and Lancashire, and forms part of the line of internal navigation between the eastern and western coasts. The Rochdale canal, thirty-one miles and a half in length, commences in the Calder and Hebble navigation at Sowerby bridge wharf, and terminates by a junction with the Bridgewater canal at Manchester. The Calder and Hebble navigation is twenty-two miles long, from its junction with the Aire and Calder navigation, about a quarter of a mile from Wakefield, to the basin at Sowerby bridge, in which it terminates. The Calder forms a considerable portion of the line, except where cuts are made to avoid the circuitous course of the river. There is a branch to Halifax. The Barnsley canal, fifteen miles long, commences in the lower part of the Calder, near Wakefield, and joining the Dearne and Dove canal, nine miles long, which terminates in the river Don navigation, opens a communication with Sheffield and Rotherham. The Ramden canal, four miles long, commences in the Calder and Hebble navigation, and terminates at Huddersfield, from which a line of canal, nine-

miles and a half in length, called the Manchester, ton, and Oldham canal, extends to Duckenfield in the parish of Ashton-under-Lyme, near which place it is joined by the Peak Forest canal. The canals of Lancashire and the West-Riding of Yorkshire are connected with the Ouse by the Aire and Calder navigation, which includes the Selby canal, and the new canal from Ferrybridge to Goole. In 1625 an attempt was made to obtain an Act 'for the making and maintaining the rivers Ayre and Cawldes,' but no Act was passed before 1699. At this latter date the cloth goods manufactured at Wakefield and Leeds were conveyed twenty-two miles by land carriages to Rawcliffe, within two miles of the Ouse; Halifax was thirty from all water communication, and Rochdale forty miles. The clothiers of Leeds and Wakefield, in a petition presented to the House of Commons in favour of the bill, complained heavily of the difficulty of transporting their manufactures: 'the expense whereof,' they state, 'is not only very chargeable, but they are forced to stay two months sometimes while the roads are passable to market, and many times the goods receive considerable damage, through the badness of roads, by overturning.' Another Act was obtained in 1774, under which further improvements were effected in the two rivers; and within the present century the Aire and Calder navigation has been rendered one of the most efficient lines of water communication in the kingdom. The Aire is not navigable above Leeds, which town is thirty miles above the junction of the Aire with the Ouse, and twelve above the junction of the Aire and Calder. A little above Leeds bridge the Leeds and Liverpool canal locks down into the Aire. The branch of the Aire and Calder navigation to Wakefield is twelve and a half miles in length from the junction of the two rivers at Castleford; and with the Calder and Hebble navigation and Rochdale canal forms the line of communication with south Lancashire, while the Leeds and Liverpool canal is carried through the middle and western parts of that county, and terminates at Liverpool. At Huddlesey, four and a half miles from the Ouse, the Aire and Calder navigation has a branch to Selby, which facilitates the interchange of commodities between Leeds and Wakefield and the populous districts to the West, and the agricultural districts of the East and North Ridings of Yorkshire. In 1820 the undertakers of the Aire and Calder navigation obtained an Act, under which a fine canal, sixty feet wide at top, and eighteen and a half miles in length, has been formed from Ferrybridge to Goole. At Goole, which was previously a small hamlet, capacious docks have been constructed, and a custom-house established, so that goods can be shipped hence to foreign parts.

In 1828 further improvements were commenced in the Aire and Calder navigation, by which vessels of 100 tons burthen can go to Leeds and Wakefield. Additional cuts have also been made in order to avoid the circuitous course of the river, and the line has by this means been rendered several miles shorter. Goods which leave Leeds and Wakefield in the evening by the fly-boats arrive at Goole in eight hours, where they can be at once put on board steam-boats for Hamburg, London, and other places. Steam-boats for passengers are employed on this navigation.

(Priestley on *Canals*; 'Physical and Political Geography of the British Islands,' in the *Library of Useful Knowledge*.)

CALDER, a river of Scotland, called the Calder Water, runs into the Clyde five miles above Glasgow.

CALDERON DE LA BARCA, DON PEDRO, a great Spanish dramatist, born of noble parents at Madrid, in 1601, suggests a striking parallel with Lope de Vega, his celebrated countryman and forerunner in the same career. Both were wonderfully precocious: Lope wrote plays at the age of 11 or 12, and Calderon exhibited no inferior genius at 13, in his 'Carro del Cielo' (the Heavenly Chariot). Both devoted the vigour of life to the military profession, and their maturity to the ecclesiastical order; and the poetic talents of both continued to advanced age. Both of them acquired reputation and even affluence from a gift proverbially doomed to penury and at the most hardly promising more than posthumous renown*.

Lope and Calderon gave the law to the Spanish theatre.

* Lope, in one of his letters, discourses his son from poetry as unprofitable, although he was then already living in splendor in the very same street in which Cervantes was actually starving. Cervantes, however, has been the object of Europe for two long centuries, while the former, notwithstanding a bulk of his works in 22 volumes, is comparatively neglected, even by his countrymen. (Pellicer's *Life of Cervantes*, and Lord Holland's *Account of Lope de Vega*.)

They exhibit all the irregularity of Shakspeare, his mirth, and his absurdity, with his flashes of genius, and his truth to nature; thus frequently redeeming their numerous faults, and making amends for many to us now very ridiculous scenes. The fertility of these two writers is not the least surprising part of their history. Lope added 2000, and Calderon 500 pieces at least to the national dramatic stock. Their success could not fail to call forth numerous imitators at home and abroad, and to prepare the way for a more correct class of writers, such as Corneille, Molière, &c.: the French translations by Linguet doubtless contributed largely to produce this effect.

But while Lope, under Philip II. and Philip III., both of whom were averse to the stage, had to minister to the fanciful and extravagant taste of the crowds to whom alone he could look for support and success till Philip IV.'s accession in the year 1621,-- Calderon, more fortunate, enjoyed early in life the patronage both of the multitude and of the reflecting few, by coming later under a prince who was fond of theatrical amusements, and himself supposed to be the author of certain pieces bearing the title of 'Comedias de un Ingenio de esta Corte' (Plays written by a Wit of this Court).

Calderon's talents, which had been early manifested at school under the Jesuits, developed at Salamanca, and already admired in the Spanish possessions of Italy and the Low Countries, were at last encouraged by the patronage of Philip IV. Philip, who was anxious to increase the éclat of his court, and to set the first-rate wits to work for the purpose, bestowed on Calderon a knighthood of Santiago in 1636; invited him to Madrid in 1640 to write the 'Certamen de Amor y Zelos' (the Contest between Love and Jealousy), a sort of festival to be performed on the lake of Buen-Retiro; and soon raised his allowance to an *escudo* more per day. Subsequently, in 1649, he intrusted to his taste and ingenuity the plan and directions of some triumphal arches, under which the royal bride Mary Anna of Austria was to pass.

At the age of 30 Calderon entered the church, and, two years afterwards, the king bestowed on him a chaplaincy of Toledo. In 1663 he gave him another similar piece of preferment, with a handsome pension charged on the revenue of Sicily, and other similar acknowledgments of his services and merits. During the long period of thirty-seven years he wrote, by special commission of the municipality of Madrid, and of other cities, such as Toledo, Sevilla, and Granada, about 100 'Autos Sacramentales,' or sacred pieces, which resemble those of the 16th century, commonly called 'Mysteries.' The Autos of Calderon soon superseded those of all previous Spanish authors; and to their composition the poet devoted the remaining 30 years of his life after he had entered the ecclesiastical profession. In his 80th year he wrote his 'Hado y Divisa.' As the booksellers were now selling spurious works under his name, he was urged by the duke of Veraguas to make a true list of all his works, but he merely sent a list of his Autos, expressing, on religious grounds, very little concern for the rest.

Some of the Autos of Calderon, especially that entitled 'La Devocion de la Cruz' (the Devotion of the Cross, meaning its miracles), are the best productions of the kind. Augustus Schlegel has translated it, with some others of the best of his dramas, such as 'El Principe constante,' a tragedy which might be called the Lusitanian Regulus for its Portuguese lofty subject. It is indeed Calderon's masterpiece, and displays the full lustre of his genius. He wrote also a poem in octaves on the *novisimos* or *postrimerias* (the old scholastic and ascetic collective denomination of death, judgment, heaven, and hell). There is also among his works a discourse on painting, 'La Nobleza de la Pintura'; another in vindication of the stage, 'Defensa de la Comedia'; and many songs, sonnets, and ballads, with numerous short poems to which the highest prizes were adjudged on various occasions.

1 After a long controversy, it is believed that Corneille formed his *Horatius* upon the play of Calderon, as most undoubtedly he took his *Cid* and his *Mentor* from Guillermo de Castro.

2 Molière's 'Femmes savantes' was suggested by Calderon's 'No hai burles con el Amor' (Love is no joke); and Scarron, who spoiled everything, grossly disguised, under the title of 'La fausse Apparence,' Calderon's 'Nunca lo es el engaño' (The worst is never true).

3 On Linguet's 'Viol pur,' a translation of Calderon's 'Alcalde de Zalamea,' the well-known Collet d'Herbois built his 'Fayon magistrat,' represented with success in 1777 at one of the provincial theatres of France, and again in 1789 at the Théâtre Français at Paris.

4 Not to mention numerous other histories of similar kind, it should not be forgotten that Calderon's 'Secretos a voces' (The published Secret), has appeared in the Italian, French, and German languages.

he date of Calderon's death is variously stated, but that of 1681, on the 25th of May, Whitsuntide day, which is given by an old biographer, his great friend and panegyrist, appears to be the most correct; and to a certain extent it is confirmed by the word *octogenarium*, which occurs in a monumental inscription to the poet's memory in the parochial church of San Salvador, near the Hôtel de Ville of Madrid.

To revert to the parallel between the two great Spanish dramatists. Lope was bolder and ruder, Calderon more brilliant and refined, a keener observer of the female mind and manners, a readier contriver of plots, which are full of business and bustle, naturally arising from intricacies which are most happily disentangled in his *dénouements*. In this respect he surpasses even Moreto and Solis, but he does not always keep within the rules of strict morality. He allows vice too frequently to triumph, out of deference, probably, as some would have it by way of apology for him, to the fashionable morals of the time. The chivalrous delicacy as to the point of honour, which often supplies the place of morality, is displayed in its most favourable aspect in some of his dramas. Sometimes he appears to be seized with a moralizing fit, which contrasts strangely with the levity, meriment, intrigues, and mad gallantry which were exhibited for the first time on the Spanish stage in his 'Comedias de Capa y Espada' (plays of cloak and sword). These pieces take their name from the dress in which they were performed (then the general costume of the gentry throughout Europe), and in contradistinction to the 'Comedias heroicas' (historical dramas), which were intended to excite surprise and admiration. In the latter, love is the feeling which actuated the champions of chivalry, while in the former it is merely a verbose and glozing gallantry which succeeded to the poetical worship of the fair. These being a sort of dramatised novels, on subjects selected from fashionable life, gave full scope to Calderon's elegance of language, gracefulness of dialogue, facility of versification, richness of diction, and fertility of imagination; qualities indeed which sometimes make him too diffuse.

Calderon gave the last polish to the Spanish theatre without changing its nature. He imparted dignity to the historical, or, as they were styled, *heroic* comedies; but while some of them are the best, others are the most trivial of his productions, and are full of historical blunders.

The greater part of Calderon's works were published at Madrid in 9 vols. 4to. 1689: the first three volumes contain his comedies, and the six last a great number of his Autos Sacramentales. They were reprinted at Madrid in 1726 and 1760 in 10 vols. 4to. A collection of his Autos appeared also at Madrid in 1759 in 6 vols. 4to. In 1830 George Keil published at Leipzig a splendid edition of Calderon in 4 vols. 8vo., to be followed by a fifth, which is to contain some of his inedited pieces and critical remarks. The 'Teatro Español,' published by La Huerta, gives but a partial idea of Calderon's talent; for he has selected the *Comedias de Capa y Espada*, two only excepted, one of which is styled *heroica*, although it belongs to the mythological class.

CALEDONIA, the name given by Tacitus and other ancient writers to the most northern part of Britain, N. of the estuaries of Glota and Bodotria (the Clyde and the Forth), which formed the permanent boundaries of the Roman province. Tacitus calls the natives the 'Britons who inhabit Caledonia,' and he says that the reddish colour of their hair and their large limbs denoted them to be of German extraction. (*Agricolæ Vita*, 11, 25.) Agricola was the first Roman general who came in contact with the Caledonians. In the sixth year of his government he advanced beyond Bodotria by land, while his fleet followed along the coast. He found a sharp resistance, and the ninth legion was surprised by night in its camp by the natives, who were at last repulsed after much loss on both sides. In the following year Agricola marched again into Caledonia as far as the Grampians, where more than 30,000 of the natives were posted under the command of Gulgacus, their principal chief. The battle, which was won by Roman tactics, and attended with a dreadful slaughter of the Caledonians, is described in a most lively manner by Tacitus. In the night the natives retreated into the interior, after burning their houses or huts, and Agricola could not tell which way they had gone. Accordingly he moved back his army to the S. of the borders of Glota and Bodotria, the line between which he had formed by strong

outposts. [ANTONINE WALL.] There is no evidence of the Romans having ever after advanced much beyond those limits. The name of Caledonia has been often applied to Scotland in general, though improperly.

CALEDONIA, NEW. [NEW CALEDONIA.]

CALEMBERG, a principality nearly in the centre of the kingdom of Hanover, now comprised in the Landdrosterei or province of Hanover. It is a fertile tract, produces much grain, flax, hemp, &c., is well wooded in the western districts, and is watered by the Leine and Weser. Its area is about 1040 square miles. It contains 12 towns, among which are Hanover, the capital of the kingdom; Hameln, on the Weser (5800 inhabitants); and Eldagzen (2050). Market villages, and 392 villages and hamlets. The number of inhabitants was in 1812 about 139,200; 1822, 159,000; and in 1828, 162,540; it is now estimated at upwards of 170,000. In arable and garden lands it possesses about 295,000 acres, and in meadows and pastures about 120,000; the net income which they yield the owners is about 110,000*l.* (803,000 dollars), being rather more than five shillings per acre. Calenberg is also a royal bailiwick in the same principality; its name is derived from a burgh, situated on the right bank of the Leine, where the former dukes used to hold their court. The steward of this bailiwick has his office in Calenberg, a village on the Leine, with 9 houses and about 100 inhabitants.

CALENDAR. [KALENDAR.]

CALEND. [KALENDÆ.]

CALEPINO, AMBROGIO, born at Calepio in the province of Bergamo, was an Austin friar, and wrote a Latin dictionary, which was one of the earliest works of the kind, and was first published at Reggio, fol., 1502. It went through many editions, most of them with numerous additions, which made it almost a new work. Passerat's edition, 1609, with the title 'Dictionarium Octolingue,' contains the corresponding words in Greek, Hebrew, Italian, German, Spanish, French, and English. Other editions added the Slavonian and Hungarian. Facciolati, assisted by Forcellini, published a new edition of Calepino's, or rather Passerat's, dictionary, also in eight languages, two vols. fol., Padua, 1731. While engaged on this labour, Forcellini conceived the idea of a totally new and more complete and critical lexicon, and after spending 30 years in compiling it, he published it under the title of 'Totius Latinitatis Lexicon,' four vols. fol., Padua, 1771. Forcellini's lexicon superseded all former Latin dictionaries. A new edition has been lately published at Padua by the Abate Furlanetto. Calepino died in 1510 at a very old age.

CALF. The rearing and fattening of calves is a very important part of rural economy, and on the care with which this is done depends much of the profit of grass-land in particular situations. In the dairy districts the milk is so valuable, that calves are got rid of as soon as possible. In some countries they are killed when only a few days old, and the flesh is of little value, being very soft and tasteless. In others the flesh of very young calves is considered unwholesome, and penalties have been imposed on those who kill a calf before a certain age. This is the case in France and Switzerland, where ten days is the earliest time at which a calf is permitted to be killed for sale.

Wealth and luxury have introduced a very different mode of proceeding in England. Calves are suckled with great care, and allowed to take as much milk as they can swallow, in order to make them fat, and their flesh white, firm, and delicate. The price at which a fat calf is sold, when ten or twelve weeks old, is often much greater than he would fetch at twelve months, if reared in the common way. It is chiefly in the neighbourhood of large towns that the practice of fattening calves is profitable. The self-dealer buys calves in the dairy districts, and sells them again to those who suckle them. The animals are carried to a great distance in carts made purposely flat and shallow, their four feet tied firmly together, and their heads hanging over the back and sides of the cart. In this position they remain whole days without food or drink, and when they arrive at the place of sale they are so weak and attenuated that many of them die; and all of them require the greatest care and attention for several days before they recover sufficient strength to bear their natural food. If they are allowed to satisfy their appetite at first they invariably *scour*, that is, purge violently, and die. If the strong, astringent medicines sold in the shops for the *scouring* of calves is given to them in this weak state, it only accelerates

The best remedy is to boil the milk for them, and give them little at first; to mix some starch or arrow-root with it, and to give them a raw egg beat up in milk. This restores the strength of the stomach, and generally cures them. When the calf begins to thrive on the milk which he sucks, or which is given him warm from the cow, nothing more is necessary than to keep him extremely clean and dry, to give him plenty of air, but not much light, and never to disturb him between his meals, which are generally twice in the day, at the usual time of milking the cows. Where it can be conveniently done, it is better to let them suck three times a day. If one cow does not give sufficient milk to satisfy the calf when he begins to get large, another cow must be at hand. Where a number of calves are fattened at once, and no butter or cheese is made, the number and age of the calves must be regulated by the number of cows and the quantity of milk which they give, so that there shall be milk enough for all.

The calf pens should be made like narrow stalls, each for the accommodation of only one calf, just wide enough to allow him to lie down, but not to turn about and lick himself, which, if it become a habit, will much retard his progress in fattening. The bottom of the pen should be paved with brick, and washed clean morning and evening—or it should be boarded; the boards should be six inches from the ground, and have holes bored in them to let the urine drain through. A piece of chalk or powdered limestone is frequently put in a small trough, which the calf licks, and thus corrects the acidity which is apt to be generated in the stomach. The common notion that it makes the flesh whiter is a mistake, except so far as good health in the calf produces whiter flesh. When the calves are taken out of their stalls to suck the cows, they must not be allowed to play instead of suckling. If they appear not to have much appetite a little salt may be rubbed into their mouth, and they may occasionally have a raw egg put down their throat. At five or six weeks old, if a little sweet hay is tied in a small bundle with a string and hung before them, they will pick a little of it; and by thus exciting the saliva the digestion will be assisted. It is only by minute attention that the suckling of calves can be made more profitable than the making of butter or cheese. When it is well managed, and the price of veal is about one-half the price of butter by the pound, there is an advantage in suckling, but otherwise making butter is more profitable.

Calves should be fat by eight or nine weeks old, and it is seldom advisable to keep them above twelve weeks. When they get large they take a much greater quantity of milk, in comparison with what they do at seven or eight weeks old, to produce the same increase of flesh. A calf of 16 or 18 weeks (eight pounds to the stone) the four quarters, and well fattened, will always sell better than one that is larger.

When milk is scarce, and the calves have not enough to satisfy them, it may be necessary to give them some substitute, such as meal mixed with warm milk, or bal of meal and water with a little gin in them, which makes them drowsy. Linseed made into a jelly with boiling water and mixed with warm milk is given by some, or powdered oil-cake. All these substitutes can only be recommended when the milk fails—they deteriorate the flesh more or less. The best plan, in such a case, is to sell the largest calves and reduce the number, so that they may all have their fill of milk. To know the weight of the four quarters of a calf when killed, take the live weight and multiply it by 0.6. Thus if a live calf weighs 200 pounds, his four quarters when he is killed will weigh $200 \times 0.6 = 120$ pounds.

When calves are intended to be reared for grazing or for the dairy, the most perfect individuals should be chosen. They should be well examined, especially the cow calves, to ascertain whether they have a perfect udder and teats, a broad pelvis, and good lungs. If any deficiency appears, they ought to be sold or fattened. They should be allowed to suck the mother three or four days, but no more, and then be taught to drink milk out of a pail. This is soon accomplished by gentleness and care. Should there be any difficulty in teaching him to suck with the hand in the usual way, a wisp of twisted straw is put into the pail and one end of it in his mouth. This seldom fails to bring him to drink. When the calf is a week old, skimmed milk which has been boiled and allowed to cool again, so as to be milk-warm, may be given him. After a time this may be diluted with water, and a little meal stirred into it; or some thin

gruel may be made to which skimmed milk is added. Carrots or turnips make an excellent food for calves, especially if they are boiled with cut hay and given warm. In this way calves may be reared with very little milk, till they can live on grass alone. A bull-calf not intended to be kept as a bull may be castrated when three months old.

The diseases of calves are chiefly *scouring* and *constipation*; for the first, if the calves are strong, the following recipe is recommended by Clater, and appears likely to remove the complaint:—prepared chalk four ounces, crabs' eyes two ounces, white powder of burnt bones five ounces. These ingredients are pulverized and well mixed, and a large table-spoonful of the powder is given in a pint of new milk every night and morning before the calf is fed, until the purging ceases. For costiveness the following is a good and safe remedy:—castor oil one ounce, prepared kali half a drachm, ginger in powder one tea-spoonful. Mix these for a dose, and give it in half a pint of warm milk.

CALIBRE, CALIPER, or CALLIPER. The first of these words is French, and was a technical term of artillery, signifying the internal diameter or *bore* of any piece of ordnance. Since it has been naturalized in England, it has come to signify generally the diameter of any round substance, and figuratively the extent of intellectual or other qualities. Calipper compasses or callipers are compasses intended to measure the calibre or diameter of round bodies, and are formed with curved legs, knobbed instead of pointed. Being opened until the body to be measured can only just pass through them, the distance between the two internal extremities of the knobs is of course the diameter of the body.

CALICO. [COTTON.]

CALICO-PRINTING, the art of dyeing woven fabrics of cotton with variegated figures and colours more or less permanent. It has been practised from time immemorial in India, upon the kind of cotton cloth called calico, from Calicut.

There are very few dye-stuffs capable by themselves of imparting to cotton colours of sufficient lustre and durability combined. They must in general be rendered fast as well as brilliant, by the intervention of certain substances, which, in consequence of their attraction for the textile filaments and the colouring matters, form a bond of union between the two, and are on that account sometimes called bases, and at other times mordants, from their taking firm hold of, or biting, the dyes. These intermediate bodies, though colourless themselves, generally possess the power of modifying more or less the colour of the dye, or of producing from the same dye-stuff different tints; so that a piece of white cloth, after being imbued with various mordants, will assume various colours in a single dye-bath. Thus if white calico be impressed with the mordant of acetate of alumina in one set of lines, with that of acetate of iron in a second, and with a mixture of these two mordants in a third, on being exposed to the madder bath for a proper time, it will become permanently printed in red, black, and chocolate stripes.

This curious process would seem to be characteristic of the scientific refinement of the present time, and yet it was known to the ancient Hindus and Egyptians. Pliny describes it with sufficient precision. 'Robes and white veils are painted in Egypt,' says he, 'in a wonderful way; being first imbued, not with dyes, but with dye-absorbing drugs, by which they appear to be unaltered, but when plunged for a little in a cauldron of the boiling dye-stuff, they are found to be painted. Since there is only one colour in the cauldron, it is marvellous to see many colours imparted to the robe, in consequence of the modifying agency of the exipient drug. Nor can the dye be washed out. Thus the cauldron, which would of itself undoubtedly confuse the colours of cloths previously dyed, is made to impart several dyes from a single one, painting while it boils *.'

In India, where manufacturing processes have probably suffered little change in the course of three thousand years, not only is the art of using mordants well known, but that of applying resist pastes, in order to preserve the cloth from the action of the dye-bath in any desired figures or spots. In the *Société Industrielle* of Mülhausen, a town of great celebrity in calico-printing, may be seen specimens not only of modern Indian calicoes in the preparation state, typically covered with wax, to serve as a resist to the indigo dye, but of ancient styles of pencilled cloths,

* Natural History, book xxxv, chap. ii.

which had been the work of princesses, covered with figures of such complexity as could not be made without a very tedious and costly education, beyond the reach of ordinary artisans. Among other curiosities, the counterpane of a state bed is shown, six yards long and three broad, which must have taken a lifetime to execute, on their plan of applying the melted wax with a pencil.

Processes of printing, similar to the Indian, have been long practised in Asia Minor and in the Levant; but they were not attempted in Europe till about the middle of the seventeenth century, some time after its extended commerce had made the brilliant colours of the eastern world objects of general admiration and desire. Anderson, in his 'History of Commerce,' places the origin of English calico-printing as far back as the year 1676; but Mr. Thomson, of Primrose, near Clitheroe, a better authority, assigns the year 1696 as the date of the commencement of this art in England, when a small print-ground was established on the banks of the Thames, at Richmond, by a Frenchman. The first large establishment of the kind was at Bromley-hall, in Essex. It was not till the year 1768 however that the business was carried into Lancashire, where it now constitutes one of the most interesting and productive branches of English manufactures. From its outset, the printing of cotton goods encountered the keenest hostility from the silk weavers of Spitalfields, who in the year 1680, and often afterwards, assailed in a riotous manner the East India House, on account of the Company importing the chintzes of Malabar. The English government gave way to the remonstrances of the silk trade, and imposed, first of all, heavy duties on Indian calicoes, and in 1700 prohibited their importation altogether. This law became nearly inoperative, in consequence of the excessive penalties annexed to its infraction. In 1720 the wear of all printed calicoes whatsoever, foreign and British, was prohibited by a new law, passed for the purpose of allaying the clamour of the woollen and silk manufacturers; but in 1730 parliament was pleased to permit British calicoes only, made of cotton weft and linen warp, to be printed and worn, on paying a duty of 6d. the square yard. It was not till 1774, and after a most expensive application to parliament, that cloth made entirely of cotton was allowed to be printed, though cotton cloth was far better adapted to the purpose than the mixed webs of linen and cotton, which took on the colours unequally, owing to the unequal attraction of these two fabrics for dyes. The calico-printing of this country continued to groan under the most oppressive fiscal laws till the year 1831, when they were finally repealed, and the business was left to its natural rate of development, under the taste, science, and capital of the country. Since that time it has probably quadrupled in extent; a single manufacturer, Mr. Coates of Manchester, has turned off in one year a million of pieces.

Linen was long ago, and silk and woollen fabrics also have recently been made the subjects of topical dyeing, upon principles analogous to those of calico printing, but with certain peculiarities, arising from the nature of their textile materials.

Calicoes, muslins, &c. intended for printing must be first of all freed from their fibrous down by the action of the singeing machine. This consists either of a semi-cylinder of cast-iron laid horizontally, and kept at a bright red heat by a furnace, or of a horizontal range of gas-jet flames: over one of these the plane of cloth is drawn with a steady continuous motion, and at a rate suited to its texture. When gas flames are employed, a line of suction-tubes is placed over the extended web, to draw the flame up through the interstices of the cloth, which effectually clears the threads, according to the ingenious plan of Mr. Samuel Hall, of Basford. Some manufacturers singe the goods as they come from the loom; but they would find their advantage in previously washing out the weaver's dressing from them at the dash-wheel, and then drying and calendering them.

The cotton cloth must be next well bleached, because the whiter it is the more light will it reflect from its surface, and the more brilliant will be the colour of its dyes. The first step in the bleaching process is boiling the cloth in an alkaline bath, which for delicate fine goods consists of a weak solution of soda, and for stronger articles slaked lime and water. For this purpose a bowking apparatus merits the preference. It consists of a large egg-shaped cauldron, with a flat false bottom placed a little above the rounded true one, to protect the cloth from the danger of being scorched

by the fire. Through the centre of the false bottom a vertical pipe rises from near the real bottom to somewhat higher than the top of the cauldron, and carries a conical cap (umbrella-wise) above its open mouth. The boiler being filled with goods, and supplied with a proper quantity of the detergent liquid, is securely covered with a dome-shaped lid. Whenever ebullition becomes active, the steam forces a constant stream of liquid up the central pipe, causing its constant overflow, whereby the goods are irrigated and soaked with the boiling hot ley of lime, soda, or potash. During its descent it is partially cooled, but on reaching the bottom it recovers its ascensional power by the agency of the steam, and thus circulates up and down as long as the heat is maintained. The cauldron having been allowed to cool a little, the goods are removed, and subjected either to the rinsing operation of the dash-wheel, or to the proper rinsing machine. This consists of a range of wooden rollers in pairs, each lying upon its fellow, mounted in a horizontal plane upon the top edges of an oblong wooden cistern filled with water, with single roller pins at the bottom of the cistern, in correspondence with, like hand and glove, the top ones. The beginning of a series of webs stitched together at the ends being introduced between the roller pins above and round the roller pins below, the last or traction roller is placed in connexion with the moving power of the factory, while a stream of pure water is made to flow through the cistern. The cloth is thereby alternately squeezed between the top rollers and immersed in the water, so as to get effectually rinsed with hardly any manual labour. In some calico print-works, this rinsing apparatus occupies a length of forty or fifty feet.

The goods are next steeped for a few hours in a leaden or wooden cistern, containing a weak solution of chloride of lime, usually called bleaching salt. They are once more rinsed. They are now boiled in an alkaline ley, made of crude soda dissolved in water and freed from its impurities by filtration or subsidence. The goods are again rinsed, and finished by a steep in sulphuric acid very largely diluted with water. This removes any adhering particles of lime or iron, which would be apt to give the cloth, after some time, a yellow tint. They are last of all rinsed, dried, and sometimes smoothed under the calender. If they are not calendered, they are run through a machine called in Lancashire the *candroy*, which spreads them smoothly in the act of rolling them upon a cylinder.

There are four mechanical modes of printing calicoes. first, by small wooden blocks, worked by hand; second, by large wooden blocks, set in a frame, and worked by a machine called the *Perrotine*, from the name of its ingenious inventor, M. Perrot of Rouen; third, by flat copper pla (a method now nearly obsolete); and fourth, by copper cylinders, mounted in a machine of great elegance and productive powers, but of no little cost and complexity, called a one, two, three, four, or five-coloured calico-printing machine, according as it is mounted with one, two, or more cylinders. The fifth colour is generally applied by what is called a surface cylinder, covered with figures like types in bas-relief.

The blocks are made of sycamore wood, or of deal faced with sycamore. They are about ten inches long and five broad, with an arched handle on the back for holding them by. The face is either cut in relief into the design required, or the same object is obtained by the insertion edgewise into the wood of narrow slips of flattened copper wire, in the desired configurations. These narrow fillets have one edge inserted into the wood, are fixed by the taps of a light hammer, and are all filed down and polished into one horizontal plane, to secure equality of impression in the several lines. The interstices between the copper ridges are filled up with felt-stuff. Occasionally both the wood-cutting and insertion plan are combined in one block.

Calico printing by hand is performed by applying the face of the block to a piece of woollen cloth stretched over one end of a sieve-hoop, and imbued with the colouring matter of a thin pasty consistence by means of a flat brush. The block is then applied to the surface of the cotton cloth while extended upon a flat table covered with a blanket, and the impression is transferred to it by striking the back of the block with a light mallet. This method, besides the great cost of labour which it involves, has the inconvenience of causing many irregularities in the execution of the work. It has been superseded to a considerable

extent, both in France and Belgium, by the Perrotine, a machine of a most novel and elegant description. Three thin wooden blocks, engraved in relief, about three feet long and from two to five inches broad, are successively brought to bear on three of the four faces of a prismatic roller of iron, round which the cloth is successively wound. Each block rests on springs which enable it to press with the delicacy of a skilful arm; and each receives its peculiar coloured paste from a woollen surface imbued by a mechanical brush in rapid alternation. We have seen this machine operate in many print-works with surprising speed and precision, its moving shaft being driven either by arms or by a steam pulley-band. One man, with three children for superintending the three colours, can turn off about thirty pieces English in a day, which is the work of fully twenty men and twenty children in ordinary block-printing. To print a piece of cloth by hand the block must be applied 448 times for each colour. The machine, moreover, may be conducted by persons with little manual dexterity, and therefore entitled to comparatively low wages. The use of the Perrotine is spreading rapidly into every quarter of the continent, even into Russia, though hitherto unknown in England. It executes a style of work different in some respects from that of the cylinder.

This latter machine is a hollow cylinder of copper fully three feet long and three or four inches in diameter, whose surface is engraved, not by the hand-graver, but by the mechanical pressure of a steel roller from one to two inches in diameter and three inches long, which transfers the figures engraved on it to the relatively softer copper. The first steel roller, called the die, is softened before being engraved in intaglio; it is then hardened, and made, by a powerful volutary press, to transfer its design in relief to a similar die called the mill, which is the one used for transferring the design to the copper cylinder. The process of etching is also sometimes had recourse to for covering the cylinder with various figures.

The engraved cylinders are mounted upon a strong iron shaft or arbor, carrying a toothed wheel at its end, in order to put it in train with the rotatory printing machine, for one, two, or more colours. On a roller, at the upper part of this apparatus, are wound whole calico webs stitched together, the end of which is then introduced between the engraved copper cylinder and a large central cylinder covered with blanket, against which it is made to bear with regulated pressure. The engraved cylinder turns on the top of another cylinder covered with woollen cloth, which revolves with the former while its under part is plunged in an oblong trough containing the dyeing matter, which is of a pasty consistence. The engraved cylinder is thus supplied with an abundance of impressible colour, and is cleared from the superfluous by the thin edge of a flat ruler made of bronze, called vulgarly the doctor (*doctor*), which is applied obliquely to it with a gentle force. The cylinder, after its escape from this wiping tool, acts upon the calico, and rolls it onwards with its revolution, imparting its figured design with great precision.

Three and four-colour machines are now made at Manchester, of such excellence that they will print a piece of 28 yards per minute, each of the three or four cylinders inserting its distinct colour or mordant into the pattern. At this rate the astonishing length of nearly one mile of well-coloured designs of exquisite beauty is printed in an hour. Such is the combined result of mechanical and chemical science, each of them brought to a high pitch of perfection.

Dye-stuffs, capable alone of imparting fast colours to calico, have been called substantive; and such as require the intervention of a mordant, adjective. Indigo, catechu, and certain metallic oxides, belong to the former class; madder, cochineal, and Persian berries, to the latter. There are five general styles of work in calico-printing—

1. The fast-colour or chintz style, in which the mordants are applied to the white cloth, and the colours of the design are afterwards brought up in the dye-bath.

2. Where the whole surface receives a uniform tint from one colouring matter, and figures of other colours are afterwards brought up by chemical discharges and reactions. This is called the Rongean style in France.

3. Where the white surface is impressed with figures in a resist paste, and is afterwards subjected to a general dye, such as the indigo-vat.

There are besides a few partial styles of work of a peculiar nature.

4. Steam-colours, in which a mixture of the mordants and

dye-extracts is applied to the cloth, and the chemical combination is effected by the agency of steam.

5. Spirit-colours, consisting of mixtures of dye extracts with nitro-muriate of tin. These cannot be exposed to a steam heat without corroding the cloth. This style is brilliant, but fugitive.

There are only three bases which are of much importance as mordants—clay—iron—and tin. The first is commonly employed in the state called acetate of alumina; the second, acetate of iron; and the third, nitro-muriate, and oxy-muriate, or perchloride, of tin.

The first mordant is prepared by the makers of wood vinegar, who decompose alum by acetate of lime, both being in a state of solution. It is called red liquor because it is the mordant for reds in calico-printing. The second mordant is made by exposing iron turnings to the action of crude vinegar. The third mordants are prepared by the ordinary chemical means, which we need not here describe. For the most delicate purposes the acetate of alumina is prepared according to the following excellent French prescription:

50 gallons of boiling water
50 pounds of alum
10 " of soda crystals
37½ " of acetate of lead.

The alum is to be dissolved by pouring the water upon it in a tub, and stirring with a rake. The soda crystals are to be added gradually to that solution. When the effervescence is over, the acetate of lead, well pulverized, is to be strewn in at once, and stirred about till it disappears by decomposition. A deposit of sulphate of lead is formed at the bottom. Acetate of alumina, mixed with a certain portion of alum, is contained in the supernatant liquor. To form an acetate of alumina free from alum, 82 parts of acetate of lead, instead of 37½, should be employed for 50 of alum. About one-half of the alum therefore remains undecomposed in the above operation. For certain purposes a formula is prescribed in which 50 pounds of acetate of lead are used to 50 of alum.

The clay mordant is used also for particular styles in a state of combination with potash. It is prepared from the following ley:

100 gallons of water
100 pounds of potash
80 " of quicklime, boiled together for an hour.

After the calcareous matter is settled, the clear liquor is to be drawn off and boiled down to specific gravity 1.320 (64° Twaddell's Hydrometer). In 30 gallons of this ley, 100 pounds of pulverized alum are to be dissolved at a boiling heat. On cooling, crystals of sulphate of potash form.

The supernatant liquors being decanted, and the crystals slightly washed with water, about 33 gallons of mordant will be obtained.

The tint or shade of colour produced in the dyeing-bath is proportional to the strength of the mordant previously applied to the cloth. Hence by diluting the mordant to various degrees, any desired shade may be obtained. By mixing the red liquor and the iron-liquor any shade intermediate between red and black is producible in the madder-bath. When the iron-liquor is diluted, various shades of violet result from the same dye. Too much of this aluminous mordant should not be prepared at a time, as it is injured by keeping in consequence of its letting fall subsulphate of alumina.

The thickening of mordants is one of the most important operations in calico-printing, for the permanence and beauty of the impression depend not a little on the consistence and quality of the inspissating substance. Several circumstances require the consistence to be modified; such as the nature of the mordant, its density or acidity. A strong and acidulous mordant does not thicken well with starch; it requires British gum or gum Senegal. Some other mordants inspissated by starch, which have a tendency to liquefy after some days, are also liable to run during their printing on, an inconvenience easily counteracted in France by the addition of two ounces of alcohol to the gallon of the mixture, a remedy which cannot be economically practised in this country from the excessively high duties on spirit of wine. The same mordant, when thickened in different degrees, gives different shades in the dyeing; for instance, one thickened with starch gives a deeper shade than when thickened with gum. Yet there are many cases where the

latter merits a preference, because it imparts more transparency to the colours, whereas a portion of starch often remains in the cloth along with the mordant after the rinsing operation. In general, however to obtain a like consistence, much more gum is required than starch, and thus the former not only dilutes the mordant much, but by letting it dry too quickly prevents its forming an intimate combination with the stuff. Hence the tints are thin and scratchy.

The substances usually employed for thickening are the following:—1. Flour starch; 2. flour; 3. roasted starch; 4. gum Senegal; 5. gum tragacanth; 6. salep; 7. pipe-clay mixed with gum Senegal; 8. sulphate of lead and gum; 9. sugar; 10. treacle; 11. glue.

Care should be taken, after thickening with gum, not to add any metallic salts in a liquid state, such as nitrate of iron, solutions of tin, copper, subacetate of lead, &c.; for they have the property of coagulating gum. The thickener should, in fact, be skilfully adapted to each particular colour, a rule too little observed by British calico-printers.

In the colour-house there ought to be ready prepared a variety of dye-decoctions, concentrated to a proper degree either by steam boilers, or by liquid baths of regulated temperature. When evaporated over a naked fire their tint is generally degraded. The following prescription may serve as an example:—Take 5 lbs. of Brazil-wood or peach-wood, boil it for an hour in 10 quarts of water, and strain: boil the residuum in the same quantity of water for half an hour, and again strain; finally boil it a third time, and mix the whole strained liquors together. Evaporate the whole till it be reduced to 10 quarts. Add as much red mordant (acetate of alumina or nitro-murate of tin) to the liquor as will brighten its tint to the desired degree, and thicken it with British gum. The older the decoction the more beautiful will the colour be. The decoctions usually kept ready are those of logwood, Brazil-wood, peach-wood, Persian-berries, quercitron, galls, fustic, archil, cochineal, ammoniacal cochineal, and catechu.

The printing shops ought to be kept always at a pretty high temperature, as from 65° to 75° Fahrenheit; with an atmosphere rather humid than dry. It is often observed that goods printed the same day and with the same mordant exhibit inequalities in their tints; being sometimes strong and well brought out in one part, flat and meagre in another. The latter portion has been printed in too dry an atmosphere, an accident more liable to happen with cylinder goods than others on account of the small quantity of colouring matter which they receive. The nearer the mordant is to a neutral state, the less likely is this inconvenience to ensue. In the padding process, where the cloth is uniformly imbued with the mordant, the stove-room, where a great many pieces are dried at the same time, ought to have a free issue for the watery and acetic acid exhalations. The goods ought likewise to be properly extended before they are dried, for without this precaution the acetic acid would accumulate in the folds, and prevent the base of the mordant from combining with the fibres of the cloth. The consequence would be white spots in all such places, which would render the print unsaleable. When a strongly acid mordant has been employed, too much pains cannot be bestowed in facilitating its escape from the hot flue through which the goods are drawn in the drying, for the acetic fumes are capable of affecting the surface to such a degree as to cause a white down to appear upon the cloth after it is dyed. Fans will be found very useful in such cases to blow away the acidulous vapours.

After these general remarks we proceed to describe the processes of each of the five styles of printing above enumerated:—

I. The chintz or madder style, upon a white ground.

The following topical colours belong to this head: 1. *Black*. It consists of two quarts of iron liquor, sp. grav. 1.040 (8° Twaddell), thickened with four ounces and a half of starch, and four and a half of flour; the starch being first rubbed up with a little of the liquor, then mixed with the flour. The old liquor being added, the mixture must be boiled over a brisk fire to form the paste, care being taken meanwhile to stir so as to prevent its being burned by sticking to the bottom. The colour is to be poured into an earthen pot, over half an ounce of olive-oil, and the two are to be thoroughly incorporated. 2. *Red*.—Take two quarts of red liquor at sp. grav. 1.035 (6½° Tw.), eight ounces of starch, and tinge with a little Brazil-wood. Boil for five or six

minutes, and pour into a pipkin, stirring all the while. Different shades of red are obtained by preparing mordants of different strengths from the above, thickened either with raw or roasted starch. 3. *Dark Purple*.—Take one quart of red liquor at 8° Tw., one quart of iron-liquor at 8° Tw.; Mix, and thicken like black, No. 1. By varying the proportions of the two liquors any brown tint may be obtained. When British gum is employed to thicken reds one pound and three-quarters of it are required for every two quarts of the liquor; in which case no other tingeing substance is needed.

4. *Violets*.—Take two quarts of iron-liquor of sp. grav. 1.007 (1½° Tw.), thicken with starch, and tinge with a little logwood. These four mordants, for four colours, are sometimes applied at once, but where brilliant reds and rose-colours are wanted the dark colours must be inserted separately, after the bright ones are raised, by a subsequent process called grounding (filling up the ground of the figures) in this country, and *rentrures* (re-entering additional colours) in France.

The goods, after being thus printed by the rollers, the hand blocks, or the perrotine, must be hung up in a warm chamber for 36 hours at least before having their colours brought up in the dye-house.

The dyeing may be divided into three operations. 1. The dunging; 2. the madding; 3. clearing the madder-grounds. The grounded colours will be treated of afterwards.

1. The dunging is undoubtedly one of the most important though mysterious processes in calico-printing, and too much pains cannot be bestowed upon it, since it determines in a great measure the success of the madder-dyes. Its objects are the following:—1. to effect the complete combination of the subsalts with the cloth, and to separate the acetic acid which had not been dissipated in the stove room; 2. to dissolve and separate from the cloth a portion of the substances used for the thickening, and to wash away at the same time the mordants mechanically retained by the paste; 3. to prevent the uncombined part of the mordants, as well as the acetic acid, with which the bath becomes eventually charged, from re-acting upon the part of the mordant combined with the cloth, or from attaching itself to the white ground. Cow-dung, the kind employed, affords to chemical analysis the following constituents:—1. an animalized fibrous substance, to the amount of ten per cent; 2. albumen; 3. animal mucus; 4. a substance resembling bile; 5. several salts, of which the principal are muriate of soda and of ammonia, acetate of ammonia, and phosphate of lime; 6. benzoin, or musk, which gives it a peculiar flavour. Among all these ingredients the fibrous matter plays the principal part in the dunging of prints, from its great affinity for the alumina and the oxide of iron; it seizes them the moment they are diffused in the bath, and thereby prevents their being deposited upon the parts of the cloth which should remain white.

The chalk occasionally added to the dung-bath serves to neutralize the acids as they are evolved from the mordants; a little carbonate of soda is used in preference by some printers.

For delicate pinks, pale yellows, and cochineal lilacs, a bran-bath answers better than one of dung.

The dung-bath cistern is now made of an oblong rectangular form, three or four feet wide, four or five feet deep, and 12 or 15 feet long. Cast iron is usually employed for making the cisterns in this country, and wood for those of the continent. It has one range of rollers level with the surface of the liquor, and another range near the bottom, over and under which rollers the expanded cloth is slowly passed in a serpentine course, so as to ensure the thorough operation of the dung upon it. The rollers revolve by mechanical power, the extreme one being double, and placed above the cistern like a calender to draw the cloth (which is in webs stitched together) continuously through the bath by means of a cord tied to its end. One pail of dung is diffused through fifty or sixty pails of water. The bath must be replenished with dung from time to time, as it gets exhausted by the passage of the mordanted goods. The temperature of the bath should be maintained at about 150° Fahr. by means of a steam-pipe entering at the bottom. The duration of dunging is different for different goods, from fifteen to twenty minutes being the average time, which is regulated by the speed of the discharging calender rollers. Too high a temperature and too much dung are injurious to delicate colours, such as the pinks and the yellows; but colours thickened with starch require a higher temperature than

those thickened with gum. The piece should never be allowed to stop for a moment in its progress through the bath, for the part in contact with the surface of the water would run, and cause a line mark across the cloth.

The goods must be washed in the dash-wheel, or run through a rinsing trough, and then winched through a fresh dung-cistern (commonly called a *dung-copper*) at a lower degree of heat than the former, and then washed again. They are now ready for the dye-bath.

Madder always contains a free acid, which is more abundant in some species of the root than in others; that grown in calcareous soils often contains so much chalk as to be sufficient for neutralizing the acid in the bath. The other species requires the addition of a little chalk or carbonate of soda, but care must be taken not to add an excess, for that would degrade the colour. Madder is the only dye-stuff which can saturate mordants so completely as to permit the goods to be subjected to other dyeing-baths, such as yellows, olives, &c. without losing its brilliancy by these fresh operations.

Black, red, and chocolate are dyed with madder and sumach, but purple with madder alone. Different quantities of madder are used according to circumstances, from one pound to three pounds and a half per piece of 21 yards, the sumach being one-eighth of the madder. The goods are entered into the automatic-reel bath when the copper is cool, the heat being brought up by slow degrees by means of internal steam-pipes, or an external fire, during the course of two or three hours, till ebullition begins. The boiling is continued sometimes for a quarter of an hour. The goods are all the time kept in a state of constant motion, down through the liquid bath on one side, up through the air and incumbent steam, and down into the bath through the other side, there being an open frame of wooden spars between them and the two sides of the copper. They are then washed and boiled in bran and water for ten or fifteen minutes; indeed if they have much white they must be branned a second time or even a third time, to clear the ground, and must be washed between each branning operation. The whitening is completed by spreading the goods upon the grass for a few days, or by passing them over a self-acting winch-reel, through a weak solution of chloride of lime.

For strong reds a second maddering is sometimes given. In all these dyeing operations too great a length of cloth should never be winched over one reel, for it would be left too long in the bath, and might get spotted or stained. The modern automatic coppers are of an oblong shape, semi-cylindrical at bottom; and the revolving axis which runs along their top is mounted with eight or ten reels, each of which winches only a few pieces tacked together into an endless web.

Reds and pinks are brightened by being winched for half an hour through a soap bath, at 150° Fahr., containing three-quarters of a pound per piece. They are then washed in clear water. At other times they are passed for a quarter of an hour through a bath containing a little of the solution of nitro-muriate of tin, called *spritz* by the dyers; and are then soaped, and rinsed, and laid out upon the grass; or cleaned, as in France for fine colours, with a weak solution of chloride of soda.

The grounding colours, or topical dyes, employed after the maddering, are the following:—

1. Pencil-blue: to two quarts of water heated to 145° Fahr. put eight ounces of indigo, eight ounces of orpiment, each in powder, and eight ounces of quicklime. Heat the mixture up to the boiling point; withdraw the vessel from the fire, and when its contents are lukewarm, add six ounces of subcarbonate of soda (dry); stir the whole ingredients well together, and let them settle for twenty-four hours. The clear liquor being decanted off, is to be thickened with one pound of gum for each two quarts of it in measure. This colour was formerly introduced by the pencil; it is now applied by one of the rollers of the calico printing-press. Twenty-four hours after receiving this impression, the cloth must be rinsed in running water.

2. Another pencil-blue is made as follows:—take two quarts of caustic soda-ley, sp. grav. 1.160 (32° Tw.) heated to 115° Fahr., add twelve ounces of hydrate of protoxide of tin, and eight ounces of ground indigo. Heat the mixture till it boils, removing or applying the heat twice or thrice. Lastly, let it cool, and thicken with three pounds of raw sugar. The application of this colour requires very nice management. Dry, fine sand is sometimes dusted over the

piece as soon as it is printed, to prevent the colour from running. If these blues be not skilfully and rapidly introduced, the tints are liable to differ in different parts of the

3. The following affords an excellent-cylinder blue:—fourteen quarts of caustic-ley, as above; three pounds and a half of indigo; five pounds of hydrate of protoxide of tin. Boil the mixture for ten minutes; take it off the fire; add three pounds of Venice turpentine, and then thicken with eleven pounds of pulverized gum. Print on this colour; let it dry for two days; wash in the dash-wheel; and pass the goods through a soap-bath, containing a little soda to brighten the blue, and take off its grey tint. The turpentine serves to obstruct the contact of air in the pot with the deoxidized indigo, which would spoil it as a dye before application.

4. Topical Prussian blue dye:—diffuse through two quarts of water eight ounces of starch, boil, and pour into a pipkin. Take two ounces and a half of Prussian blue, grind it up with three ounces of muriatic acid, and after twenty-four hours dilute with two ounces of water. Mix this preparation with the above starch-paste while it is warm. When the mixture is cold, add to it four ounces of oxymuriate of tin, and pass the whole through a sieve. Goods grounded with this colour must be passed merely through the rinsing trough.

Topical yellows are prepared from Persian berries, quercitron, and bi-cromate of potash; orange from the subchromate of lead; green from nitrate of lead, bi-cromate of potash, Prussian blue, and nitrate of zinc. The details of their preparation exceed the limits prescribed to this article.

II. Yellow-dye or Bath.

For bark-yellows, the same mordant is used as for madder-reds. The piece, when slightly dunged, is winched in the quercitron-bath, heated gradually up to from 130° to 140° Fahr. during about an hour. A gold colour is given in the following way:—dissolve five pounds of sulphate of iron, and one and a half of acetate of lead, in a gallon of water; mix well, and after the precipitated sulphate of lead has subsided properly, decant the clear liquor, thicken it with gum, and apply the paste by the block or cylinder to the cloth; expose to the air for eight or ten days; and then winch it through a solution of potash thickened a little with lime. Whenever the black oxide of iron first precipitated upon the cloth begins to turn red, the piece must be removed into a rinsing cistern and well washed. Yellows are however now given very generally with chrome. For this purpose the following prescription will serve:—thicken two quarts of water with six ounces of starch, pour the paste into a pipkin and add to it immediately four ounces of acetate of lead, and four ounces of nitrate of lead, both in powder; mix the ingredients well, and leave the mixture to settle and cool, colouring it with a few drops of solution of chromate of potash. Print on this paste with the cylinder or the block, and pass the goods through a roller dyeing-bath containing bi-cromate of potash dissolved in the proportion of two ounces per piece; having first charged the cistern with a solution containing half a pound in solution. Then pass them first through the rinsing-rollers, and finally through a very dilute muriatic acid to clear up the ground.

Green printing with chrome may be performed as follows:—mix two quarts of caustic soda-ley at 1.160 sp. gr. (32° Tw.) with three ounces of ground indigo and ten ounces of hydrated protoxide of tin. Heat the mixture to the boiling point, withdraw it from the fire, and when lukewarm add, by slow degrees, a solution of one pound of acetate of lead in half a pound of acetic acid of sp. gr. 1.050. When the effervescence ceases, thicken it with twenty ounces of gum and twenty ounces of roasted starch. Pass the mixture through a very fine sieve or sieve. After this paste is applied by the cylinder or block, the goods must be passed through milk of lime for ten minutes; then plunged for an hour in running water, and well rinsed. They must now be passed through a solution of bi-cromate of potash then rinsed, and finally passed through weak acetic acid to clear the grounds. They may now be dried and prepared for the market. This colour requires for its perfection, that the goods be not, through the bath in too dry a state, because the colour would be apt to scale off. Before passing them through a machine therefore they should be hung up in a humid atmosphere.

Madder purp. obtained by the application of the acetate of iron mordant allowed to act upon the goods hung

in the air for six or eight days; and after dunging, and passing them through the madder-bath, then branning and clearing.

Cochineal pink is communicated by applying the aluminous mordant, with the precautions above prescribed, and raising the colour in a bath containing about an ounce of cochineal for every piece of cloth. Cochineal has a feeble affinity for cotton, and neither needs nor admits any other process for clearing the ground except simple washing in water.

Manganese brown.—Solution of sulphate or muriate of manganese, properly thickened, being printed on, the calico is to be dried, and passed through a powerful caustic lye; from which it must drop into a solution of chloride of lime. The manganese is thereby raised to a higher state of oxidization in which it exercises a pretty strong affinity for cotton. In France a little tartaric acid is added to the solution of muriate of manganese before thickening it with gum, of which one pound and a quarter are used for two quarts of the liquid, at a sp. gr. of 1.075.

Catechu brown, called *carmelite* by the French. In one gallon of water boil one pound of powdered catechu till the liquor is reduced to half its bulk; pass it through a very fine sieve; dissolve in the filtered liquor four ounces of verdigris, and let the solution cool. Thicken with five ounces of starch, and while still tepid dissolve in it five ounces of powdered sal ammoniac. Print this dye on the goods, and after a few days pass through the rinsing apparatus.

The second style of calico-printing consists in giving a general dye to the cloth, and discharging portions of the ground, which has the effect of producing a number of white or variously coloured figures upon it. Discharges are of two kinds: the simple, and the compound or mordanted.

1. Discharge on a Turkey red ground. For the communication of this beautiful fast colour to cotton cloth, see DYEING.

The elegant style of simple and mordanted discharges of Turkey red cloth was invented many years ago by MM. Kœchlin, of Müllhausen, and introduced into this country by Mr. Thomson, of Primrose, near Clitheroe. An excellent white discharge paste is made by the following prescription: dissolve in two quarts of water three-quarters of a pound of oxalic acid and a pound and a half of tartaric acid, and add to the solution two quarts of lime juice concentrated to sp. gr. 1.230 (46° Tw.). Thicken with six pounds of pipe-clay and three pounds of gum. This is to be applied with the block or the cylinder-machine. The piece after being dried is passed through a bath of solution of chloride of lime of the following construction:—

A cistern of wood, frequently lined either with zinc or lead, about five feet square, and six feet deep, is furnished with a square wooden frame-work, bearing a series of parallel rollers in two ranges from top to bottom; which frame may be let down into the cistern, and lifted out at pleasure by the help of a pulley and counterpoised cord. The cistern is to be filled with a solution of chloride of lime, having a specific gravity of about 1.040 (2° Tw.), and a proper decolouring force by the indigo test. Before entering the goods, the bath should be stirred up a little. The calico-pieces, stitched together lengthwise, are now by means of a guiding-cord led serpent-like over the respective rollers in horizontal planes, and are drawn through by a pair of squeezing-rollers at the opposite side to that where they entered. The cloth should be exposed to the action of the chloride liquor during a space of three minutes, by the equable motion of the drawing-rollers; and on its escape from them should be allowed to fall into a cistern of water, or be passed through the rinsing apparatus.

Common madder reds and pinks are discharged in another way. The goods are passed through the acetate of alumina liquor in the trough of the padding-machine, called *fontard* by the French, whereby they are prepared for the madder-bath. They are dried, and then impressed with the discharge paste by means of the engraved block or cylinder. This paste consists of concentrated lime-juice, properly thickened with pipe-clay and gum. Sometimes a little tartaric acid is added, or even bisulphate of potash for the sake of economy. This mordant is also sometimes applied before passing the cloth through the padding-machine; a practice supposed to produce the blarest whites, as the mordant in this case is never allowed to attach itself to the places intended to be white. If cloth so treated be subjected to dyeing in the madder-copper, its ground will come out red; if in the madder and logwood-copper, it will come out

reddish brown; if in the cochineal, it will come out a beautiful pink; and in the logwood alone, a chocolate; with logwood and galls, black.

If, after applying the above discharge-paste by the block or cylinder, the goods be padded with iron-liquor or a mixture of iron and aluminous liquor, on dyeing them up in the madders, or other coppers, prints with various dark grounds will be obtained, enlivened by white figures. The best discharges upon manganese or bronze grounds consist of the acidulous nitro-muriatic solution of tin, or salt of tin. To two quarts of water, made into a paste with nine ounces of wheaten flour, add, when cold, from half a pound to a pound of muriate of tin crystals, according to the depth of the manganese tint to be discharged.

Compound discharges not only remove the mordant from the ground wherever they are applied, but introduce a new mordant upon the discharged points, so as to lay the foundation for these points receiving peculiar colours in the subsequent dyeing or padding operations. When mordanted goods are intended for the discharge process, they should not be much exposed to the air, as the mordant becomes thereby too fixed a nature to be completely removed. Nor should they be washed out before the piece receives the discharge; for it ought to be kept in mind, that passing the goods through either the dung-bath or even chalk and water, tends to fix the mordant too firmly for the perfect action of the discharge. After receiving the discharge-paste from the block or cylinder, the goods should be hung up in a cool place; for if suspended in a hot chamber the effect of the discharge will be impaired. After exposure for about 21 hours, more or less, according to the nature of the discharge, they must be subjected, at the rinsing-roller machine, to water heated to about 140° Fahrenheit, and mixed with a little chalk or carbonate of soda, just enough to saturate the acidulous washings. They are then washed in cold water, next dunged, and finally dyed up in the proper copper.

Violet ground with red-and-white figures.—Pad with very weak iron-liquor; dry moderately; print on the cloth with the one cylinder of the two-colour machine the red liquor mordant properly acidulated with concentrated lime juice of specific gravity 1.240 (48° Tw.), and with the other cylinder the discharge-paste strengthened with tartaric and oxalic acids. After drying, rinse the goods through chalky water; dung, and dye in the madder-copper, and clear them as already prescribed.

Grey ground with pink figures.—The grey is first given with decoction of galls and nitrate of iron, applied the one after the other. The discharge-paste is made by thickening two quarts of a strong decoction of Brazil wood or peach-wood with nine ounces of flour, and adding to the paste when cold ten ounces of solution of tin, made by dissolving salt (muriate) of tin in twice its weight of muriatic acid.

Chrome-yellow discharge upon Turkey-red ground.—Take 2 quarts of lime-juice of specific gravity 1.09; dissolve in it 2 lbs. of tartaric acid, 2 lbs. of nitrate of lead; thicken with 3 lbs. of pipe-clay and 1½ lbs. of gum, each previously pulverized. Tinge the mixture with a little chromate of potash, to indicate its nature. Most mordants are faintly coloured for that purpose. After applying this paste as above prescribed for the white discharge, pass the goods through the bath of chloride of lime, and rinse; then pad with bi-chromate of potash, which converts into a brilliant yellow all the figures to which the discharge-paste has been applied.

Green discharge of Turkey-red ground.—To the above discharge for chrome-yellow add 12 ounces of Prussian blue colour, prepared by mixing 5 lbs. of Prussian blue in powder with 6 lbs. of muriatic acid, and diluting the mixture after 24 hours' digestion with 4 lbs. of water.

Bi-chromate of potash may be employed as a discharge. After having dyed the goods in the indigo vat, they are to be padded in a bath of bi-chromate of potash, containing from 1 oz. to 1½ oz. of the crystals per quart, according to the depth of the blue to be discharged. Dry in the shade without heat, and print on the following discharge:—dissolve in 2 quarts of water 1 lb. of oxalic acid, 8 oz. of tartaric acid, and thicken the solution with 3 lbs. of pipe clay and 1½ lbs. of gum, adding to the whole 4 oz. of muriatic acid. After this paste is printed on, the goods must be rinsed through chalky water heated to 145° Fahrenheit, then washed in clear water, and passed through very dilute sulphuric acid.

The bi-chromate acts here a similar part to chloride of lime, for wherever the roller applies the acidulous paste there is an immediate white discharge, with the disengagement of a peculiar odour.

III. Resist Pastes.—This name in England, and *reserves* in France, is given to the substances which possess the property of counteracting the indigo-vat dye, in the spots to which they are applied to cloth. They have been divided into four classes:—those of a fatty nature; those with a basis of metallic salts; the coloured reserves, capable of communicating different colours in the course of their application; and lastly, mordant reserves, which form the *lapis lazuli* style. The first are used only in silk-printing.

After printing on the resist pastes, the goods should be hung up in rather a damp than a dry atmosphere.

White resist for deep blue, to be applied by the cylinder.—Dissolve in 3 quarts of water $1\frac{1}{2}$ lb. of acetate of copper in crystals, and 5 lbs. of sulphate of copper, adding thereafter 3 lbs. of acetate of lead; thicken with 5 lbs. of gum, and add to the whole 5 lbs. of sulphate of lead. Print on with this paste; hang up for two days, and dip it during two hours, by repeated immersions, in the blue-vat. Finally, pass through very dilute sulphuric acid to clear up the white figures.

Chrome-yellow resist.—Dissolve in two quarts of water $\frac{1}{2}$ lb. of nitrate of lead, $\frac{1}{2}$ lb. of the acetate of copper (vulgarly called distilled verdigris); add to the solution one pint or nearly so of a saturated solution of subacetate of lead; thicken with $\frac{1}{2}$ lb. of gum and 3 lbs. of pipe-clay. Triturate the whole together, and pass through a sieve.

After printing on this resist paste, the goods must be hung up for two days, and then dipped in the proper blue-vat; for the composition of which see DYEING. Steep the goods in water for half an hour, then rinse out slightly, and pass through a trough 12 pailsful of tepid water holding half a pound of soda crystals in solution. Turn over for a quarter of an hour, and rinse again. Now pass the goods for half an hour through a solution of bi-chromate of potash, containing 5 oz. for every piece; rinse; and, in order to separate the paste, pass through muriatic acid largely diluted with water, till the yellow hue comes fully out. Wash and dry.

The Lapis Lazuli style. Resist for a full-bodied red.—Dissolve in two quarts of red liquor, specific gravity 1.09, 2 oz. of corrosive sublimate, and thicken with 2 lbs. of pipe-clay and 1 lb. of gum, adding 4 oz. of olive oil. This and other coloured reserves are to be printed upon the cloth with the three or four-coloured calico-machine; four days thereafter give the pieces, at different periods of ten minutes each, successive dips in the blue vat of the desired hue, with alternate exposure of them in the air also of ten minutes, according to the blue tint in demand. Rinse in a stream of water for half an hour.

Into a copper nearly filled with water put two pailsful of bran; make the contents boil; then add cold water to lower the temperature to 180° Fahrenheit. Enter the goods, and winch them during twenty minutes in the bran-liquor; remove and rinse them; pass them next through a trough containing sixteen gallons of water acidulated with three quarts of vinegar, and thereafter wash to prepare for the madder-dye, which is to be done with the precautions already prescribed, taking care not to raise the heat of the madder-copper above 190° Fahrenheit. The lapis style of goods must be finished with a bath of bran and exposure on the grass, twice or oftener alternated if necessary, to bring out the lustre of the colours. A little soap-water aids in the brightening.

Though China blues differ in their principle of application, they may be considered most conveniently under this head. The blue colour is prepared by grinding 16 lbs. of indigo, 3 $\frac{1}{2}$ lbs. of orpiment, 22 lbs. of copperas, with 5 $\frac{1}{2}$ gallons of water, in the common indigo mill during three days. A part of this paste is to be thickened with strong gum-water in successive degrees of dilution, and a part is to be served unmixed. Take three different shades of blue, the darkest being thickened with starch, and the pale with gum, and apply them by the cylinders of the three colour machine. Hang up the pieces for two days in an airy place not too dry, and then proceed to dip them as follows:—three cisterns must be charged; the first with 300 lbs. of lime for 600 pails of water; the second with a solution of sulphate of iron (green copperas), at a density of 1.048 (9 $\frac{1}{2}$ Twad.); the third with a solution of caustic soda lye,

at a density of 1.055 (11 Twad.), prepared from soda crystals and quicklime with water. The pieces being stretched on the frames, are to be dipped into the vat No. 1, and left there for ten minutes; they are then withdrawn, and allowed to drip during five minutes. They are now dipped in vat No. 2, for ten minutes, and taken out to drip for five minutes. The following table will place the series of operations in a clear light.

Dip in the vat.	Du	g ten minutes.	Drip for five minutes.
1	.	.	.

In the dipping of China blues care should be taken to swing the frames during the operation. After the last dip, the frame with the piece upon it must be immersed in a fourth vat, charged with sulphuric acid of specific gravity 1.027 (5 $\frac{1}{2}$ Twad.). The object of this immersion is to remove the oxide of iron deposited upon the surface of the cloth in its successive passages through the lime and copperas vats. It is next exposed for an hour to a stream of water, and finished by the action of a tepid bath of sulphuric acid of specific gravity 1.027. The blues are afterwards enlivened by a feeble soap bath, at a heat of 145° Fahrenheit.

The theory of China blues is one of the most beautiful developments of modern chemistry. The indigo and sulphate of iron imprinted at first on the cloth exercise no mutual action upon each other till the cloth is plunged into the lime-water vat. Here a portion of the sulphate of iron is decomposed, and its protoxide is rendered free to de-oxidize the indigo, and to render it soluble in the lime-water. In this dissolved state its particles can penetrate the textile tissue, combine with its filaments, and on exposure to the air become a fixed insoluble blue. On dipping the cloth into the second copperas vat a new layer of oxide of iron is formed on the whole of its surface, which oxide operates only on the indigo spots, de-oxidizing another portion of the indigo, which becoming soluble is removed at the second dip into the lime-vat. By these alternations successive deposits of oxide of iron and sulphate of lime ensue, for the separation of which from the cloth the frame needs to be agitated in the lime-vat. In the copperas vat, on the contrary, the frame should be kept motionless, to favour the deposition of as much oxide of iron as possible upon the indigo points. From these circumstances we may account for the accidents which frequently befall the China blue process in unskilful hands. The blues sometimes scale off, from the paste being dried too hard before the goods are dipped. When the temperature of the vat-liquors is too low, the blues get a grey tint, and are always dull.

IV. Steam-Colours.—This modern style combines with the beauty of colour such a degree of solidity as can be obtained only by the madder copper. An example will illustrate the mode of procedure. The goods are to be padded in the following mordant at a sp. grav. of 1.047. In 30 gallons of boiling water dissolve 30 lbs. of alum, 5 lbs. of dry carbonate of soda, and 15 lbs. of acetate of lead. After mixture and subsidence, draw off the supernatant acetate of alumina. After being padded, the goods are to be dried over the hot flue, and, after being hung up three days, they are to be washed in chalky water at 133° Fahr., then rinsed in clear water and dried. The goods should be smoothed by the calender before being printed.

Preparation of mordant for steam-colour:—

Dissolve in 7 gallons of boiling water 10 lbs. of alum, 5 lbs. of acetate of lead, and 20 oz. of sal ammoniac. Let the mixture settle, and decant the supernatant liquor, of sp. gravity 1.075. Thicken with gum.

Black figures are given by printing on the following paste. In two quarts of strong decoction of logwood, thickened with 8 oz. of starch, dissolve, while tepid, 2 oz. of sulphate of iron. Pour into a pipkin containing 1 oz. of olive oil; stir, and when it is cold, add 4 oz. of nitrate of iron containing a little acetate.

Full-bodied Red.—Thicken 2 quarts of a strong decoction

of peach-wood by boiling 8 oz. of starch in it; when cold, add 12 oz. of solution of nitro-muriate of tin.

Steam-Blue by Prussiate of Iron.—In 1 quart of water dissolve 3 oz. of oxalic acid, or $3\frac{1}{2}$ oz. of tartaric; and in another quart dissolve 6 oz. of prussiate of potash. Mix these two solutions, let them settle during 24 hours, decant the clear supernatant liquor, and thicken it with $1\frac{1}{2}$ lb. of gum.

Steam-Green paste is prepared by adding to the preceding blue a strong decoction of Persian berries, mixed with the above aluminous mordant containing sal ammoniac, and thickened. The proportions of the yellow and blue pastes determine the shade of green.

The supernatant liquid of the blue formula contains ferro cyanic acid, convertible, by the steam-heat and the agency of the vegetable acid, into Prussian blue, which fixes on the cloths.

Lemon-Yellow.—Two quarts of a decoction of Persian berries, made from 2 lbs. of berries, 2 quarts of the above mordant with sal ammoniac, thickened with 3 lbs. of gum.

The goods, after having one or more of these or other such colours printed on them with the cylinder machine, should be suspended for two days in a chamber of a temperature not exceeding 85° Fahr. The colours are afterwards raised and fixed by the application of dry steam; for any aqueous condensation would spoil the prints. There are five kinds of apparatus for applying steam in steam-colour printing. 1. The column or cylinder; 2. the lantern; 3. the cask; 4. the steam-chest; and 5. the chamber. We shall content ourselves with describing the column, as it is most generally used in this country. It is a hollow cylinder of copper from two to six inches in diameter, and about forty-five inches in length, perforated along its whole surface with small holes about one-sixteenth of an inch in diameter, and one quarter of an inch apart. To the lower end of the column a circular plate is soldered of about nine inches diameter, which serves to prevent the cloth coiled round the cylinder from falling down from it. The bottom of the hollow cylinder is terminated by a tube one inch wide, which fits tight into the socket of an iron chest beneath it, into whose side the steam-pipe of supply enters. The water condensed from the steam is also received into that chest, and may be run off by means of a top-cock near its bottom. In some columns the steam is admitted at the top, and the condensed water is allowed to run off by a small syphon tube at the bottom. The goods printed with the above steam-colours and properly dried are lapped tight round this hollow cylinder and covered exteriorly with an envelope of strong cotton cloth, blanket-stuff, or flannel. The steam is then let on, and continued for 20 or 30 minutes, according to the nature of the dyes. The steam being stopped, the printed goods are rapidly unrolled from the column while still hot, lest any condensation of vapour should take place to stain them.

V. Spirit-Colours are brilliant, but fugitive; they consist generally of decoctions of dye-woods, mixed with nitro-muriate or muriate of tin. The following red will serve as an example. Thicken two quarts of decoction of peach-wood with four ounces of starch; dissolve in the paste while hot four ounces of alum; add to the mixture when cold four ounces of oxy-muriate (perchloride) of tin, and two drams of sulphate of copper.

This and such colours are applied by the two, three, or four-coloured printing machine, and passed through a drying room slightly heated. The goods are next tenderly rinsed in running water; afterwards washed, and dried quickly, but with a moderate heat.

Though this article has extended much beyond the limits originally proposed, it has left untouched a vast variety of subjects in this the most interesting, curious, and refined of all the chemical arts.

CALICUT, a seaport town in the province of Malabar, in $11^{\circ} 15'$ N. lat., and $75^{\circ} 50'$ E. long. Calicut was the first Indian port visited by Vasco de Gama in 1498. The name of the place is properly *Calicodu*. Dr. Hamilton (Buchanan) gives the following account of the origin of this name:—"When Cheruman Permal (the first monarch of Malabar) had divided that country among his nobles, and had no principality remaining to bestow on the ancestor of the *Tamuri*, he gave that chief his sword, with all the territory in which a cock crowing at a small temple in the town could be heard. This formed the original dominions of the *Tamuri*, and was called *Calicodu*, or the cock-crowing. This place continued to be the chief residence of the

Tamuri rajahs until the Mussulman invasion, and became a very flourishing city, owing to the success that its lords had in war, and the encouragement which they gave to commerce."

In 1766 the town was taken by Hyder Ali, when he enlarged the fort. His son Tipoo afterwards destroyed both the fort and the town, and removed the inhabitants to Nelluru, the name of which place he changed to Furruckabad. When the province of Malabar was conquered by the English, in 1790, the former inhabitants of Calicut returned to their old abode. Before its destruction by Tipoo the town contained between 6000 and 7000 houses. Towns in India are very speedily established; and in 1800 Calicut again contained more than 5000 houses. The inhabitants are mostly Moplays, who are of Arab descent and profess Mohammedanism.

The manufacture of cotton goods was formerly carried on here to a great extent and furnished a considerable supply of those goods to Europe; but at this time the manufacture is so far fallen off that the greater part of the clothing used in the country is imported. The exports now consist principally of coco-nuts, betel-nuts, pepper, ginger, turmeric, teak-wood, sandal-wood, cardamoms, and wax. The town is 129 miles S.W. of Serangapatam, travelling distance.

(Rennell's *Memoir of a Map of Hindustan*; Mill's *History of British India*; Dr. Hamilton (Buchanan's) *Journey through Mysore, Canara, and Malabar*.)

CĀLIDĀSA, is the name of one of the most admired Indian poets. Hardly anything is known concerning the circumstances of his life. A tradition, very generally believed in India, makes him one of the *nine gems* or distinguished poets, who lived at the court of king Vicramāditya. If by this name the same sovereign is to be understood from whose reign (B.C. 56) the years of the Sainvat æra are counted, Cālidāsa must have flourished about the middle of the century preceding the commencement of our æra. Another king of the name Vicramāditya ascended the throne in A.D. 191, and a third in A.D. 441; and several considerations, especially the highly-polished style in which the works attributed to Cālidāsa are written, favour the assumption that the poet lived under Vicramāditya II. At all events our author must be distinguished from a poet of the same name who lived in the twelfth century at the court of Rājā Bhōja, the sovereign of Dhārā. The *Naiḍaya*, a Sanscrit poem on the subject of the story of Nala and Damayanti, from the *Mahābhārata*, written in an exceedingly forced and artificial style, full of rhymes and plays upon the sound of words, to which the name of Cālidāsa is affixed, should probably be attributed to the Cālidāsa of Rājā Bhōja's court. Persons who are at all conversant with the literature of the Hindus must be aware of the almost total absence of all historical records in the Sanscrit language, and will not therefore be surprised at our being as yet unable to offer anything beyond a guess as to the epoch indicated by the tradition concerning the greatest poet that India ever produced. Further inquiries will doubtless throw additional light upon the subject; and it is to be hoped that when Sanscrit literature shall have been drawn to light and critically examined to a greater extent than has hitherto been done, a chain of internal evidence will be formed, sufficiently strong to determine the relative age and, approximatively, the date to be assigned to the principal extant works written in Sanscrit.

But however imperfect in these respects our information about Cālidāsa may be, we possess in his works abundant evidence of the power of his genius. We do not hesitate to pronounce him the most universal, the least constrained by national peculiarities, not merely of all Indian, but of all Asiatic poets with whose works we are acquainted; and to this elevated tone of his mind, which while seeming to breathe the purely human air of Greece, yet retains all the quickness and glow of feeling, all the vividness of description and imagery of the Hindu, must in our opinion be mainly attributed the undivided admiration with which the translation of his drama, *Sacuntalā*, by Sir William Jones (the first work that made known the name of Cālidāsa to Europeans), has been everywhere received. This translation appeared for the first time at Calcutta in 1789, but was soon reprinted in England, and was from the English, at an early period, retranslated into several other languages of Europe. We may particularly notice the German translation by George Forster, who appended to it

a glossary explanatory of the allusions to Indian mythology, natural history, &c. The popularity which the play has acquired on the continent is attested by the fact that several attempts have been made to adapt it to the stage. In 1830 the Sanscrit text of *Sacuntalâ* was published at Paris from a MS. belonging to the *Bibliothèque du Roi* by the late Professor A. L. Chézy, with an original French translation; and upon this edition is founded a new translation into German by M. Hirzel, Zürich, 1833, 8vo., in which the various metres of the text are imitated. Both Sir William Jones's translation and Chézy's edition have however been lately found to exhibit the work of *Calidâsa* according to the interpolated shape in which it is now current in Bengal. This discovery was made by Mr. Hermann Brockhaus, of Leipzig, who, in 1835, examined and collated the numerous MSS. of the drama in the library of the East India Company, and in the private collection of Professor H. H. Wilson at Oxford, and to whom we hope we may soon be indebted for a new edition of the play according to the unadulterated text, in which it has been preserved by the Benares school of Pandits.

We must confine ourselves to a mere enumeration of the other principal works of *Calidâsa*. Besides *Sacuntalâ* we possess two other dramatic poems attributed to him,--*Vicramôrvasi*, founded upon an ancient Indian legend of the loves of king Jurrâvas and Urvashi, a celestial nymph (translated by H. H. Wilson, in his *Hindu Theatre*; the text printed at Calcutta in 1830, and critically re-edited with a Latin translation by Lenz, Berlin, 1833, 4to.), and *Dhîr-tasamâgama*, a burlesque piece, as yet unedited. The *Megha dûtâ*, or 'Cloud-messenger,' a lyrical poem of only 116 stanzas, contains the complaints of a demigod banished to earth, who entreats a passing cloud to convey an affectionate message to his wife. It was edited with a translation into English verse and with notes by H. H. Wilson, Calcutta, 1813, 4to. The *Raghu Vansa* is a narrative poem in celebration of the family of Raghu, in which Râma, the hero of the *Râmâyana*, and as the incarnation of Vishnu an object of great veneration with the Hindus, was born: it has been edited, with a Latin translation, by Stenzler, London, 1832, 4to., and with a Sanscrit prose paraphrase by the pundits of Fort William at Calcutta, 1832, 8vo. The *Cumâra Sambhava* is another epic poem designed to celebrate the birth of Cumâra, the son of Pârvasî; but it appears that either it never was completed, or that it has not been preserved entire, for at present it closes with Pârvasî's wedding. An edition and translation of this work by Stenzler is announced as preparing for publication under the auspices of the London Oriental Translation Fund. Part of the first canto is given in Sanscrit and English, and with interesting annotations by (we believe) the Rev. Dr. Mill, of Calcutta, in the *Journal of the Asiatic Society of Bengal* for July, 1833, pp. 329-368. A short didactic poem on prosody, exhibiting the most common sorts of metre, and called *Srutâ-bhâsha*, is likewise attributed to *Calidâsa*.

CALIDRIS. [CHARADRIADÆ.]

CALIFORNIA is situated on the shores of the Pacific Ocean, and forms the N.W. portion of the United States of Mexico. It consists of two parts, Lower California, a peninsula, divided from the mainland by the Gulf of California, and extending from the Cape of S. Lucas (22° 45' N. lat.) to the N. extremity of the Gulf (about 32° N. lat.); and Upper California, which comprehends the whole coast extending farther N. to 42° 30' N. lat., where it borders on that part of the United States which lies on the Columbia River.

Lower California may be considered as one continuous mass of high, bare, and steep rocks, with numerous ravines intersecting them. With the exception of two or three places, it hardly contains any level ground that can be called a valley. Nearly all the places which contain a small tract of cultivable ground are on the E. declivity of the mountains: the western side generally sinks with a steep descent to the shores of the Pacific. Towards the northern extremity of the Gulf, from about 30° N. lat., the mountains recede to a considerable distance from the shore, and leave a large tract of flat country between them and the sea; but this surface, being composed of fine sand, is entirely sterile.

The bareness of the rocks is chiefly owing to the climate, which is exceedingly dry and hot. Only the southern portion has the annual rains, which last for six weeks, or two months, in September and October. At Loreto (about 25° 30' N. lat.) it does not rain every year, but only at intervals of from five to six years, when the rains

descend in great abundance, but do not last for a long time. Further north it never rains, at least so far as is known. The heat is excessive. The thermometer is known to rise to 100° Fahrenheit, and even 110° and more, which however is probably caused in part from the reverberation of the sun's rays from the bare rocks. We are not informed how low the thermometer descends, but probably never much below 80°. Lower California may consequently be considered one of the hottest countries of America.

Earthquakes are not known; but there is a volcano near 28° N. lat., in a group of mountains called *Castres Virgines*.

The vegetation is very scanty. The number of trees is small, but some of them are valuable, such as the mesquite tree, on whose leaves cattle feed when there is no grass, which happens very frequently. The bark of some is used for tanning, and others produce edible fruits, which grow very well in the hot and dry valleys, especially figs, quinces, olives, dates, and vines, which have been introduced by the Spaniards. A good sort of wine is made. In a few places Indian corn, mandioca, and some other plants, are cultivated; but the produce of these spots is not sufficient for the consumption of the scanty population, and therefore Indian corn and wheat are brought from the mainland and exchanged for fruit, spirits, soap, salt, pearls, and tortoise-shells.

Cattle, horses, and mules are rather numerous in proportion to the population. They pasture on the mountains when grass is to be found, and at other times feed on the leaves of the mesquite-tree. Hogs are still more numerous, and fatten upon snakes. Among the wild animals are wolves, foxes, deer, and different kinds of goats, of which one, called *berenda*, is distinguished by enormous horns, and resembles the mouflon (*ovis Ammon*) of Sardinia. Ground-squirrels, rattle-snakes, lizards, and scorpions abound.

The mineral riches are very inconsiderable. Only one mine is worked, about ten or twelve miles N.W. of La Paz, where gold is extracted, but the metal is not abundant. It is supposed that the western declivity of the mountains contains a considerable quantity of minerals, but if this be the case, they will probably never be worked, as this part of the peninsula is quite uninhabitable.

Though Lower California was discovered by Hernando de Grijalva in 1524, no settlement was formed by the Spaniards before 1698, when the Jesuits established themselves here, and began to collect the wandering Indians into their missions, and to convert them. But the population was of course very scanty, and so it is still. All the inhabitants of the eighteen missions probably do not exceed 4000, and perhaps about an equal number live out of the limits of the missions. The Indians belong to several tribes, of which the Pericues, Monquis, and Colimies are the most known. They speak different languages, and go nearly naked.

Loreto is considered the capital of Lower California. It stands in a valley about 2000 or 3000 feet wide, and surrounded by wild and sterile mountains, of which La Giganta (the giantess) perhaps rises to 5000 feet. The valley contains only the town, which is small, and inhabited by about 250 persons; and two gardens, which belong to the community, and whose fruits supply the principal article of trade. Its anchorage is open to the winds from N.N.W. and S.E.

In the vicinity of La Paz, farther to the south, is a considerable quantity of cultivated land, and the gold mine of S. Antonio. At this place fruit and vegetables of excellent quality are raised. Its whole population is about 2000. The harbour of Pichilguo, which lies near La Paz, is good, but only small vessels can enter it, the water being shallow.

Upper California, in its western districts, which are the only parts known, in some degree resembles Lower California. The E. boundary-line of this country is not determined, but, according to the prevailing opinion of the Mexicans, it extends E. as far as the range of the Rocky Mountains, near 109° W. long. Its W. point, Cape Mendocino, is about 124° W. long. Thus this country would extend towards its N. extremity (40° N. lat.) nearly 800 miles from E. to W., and nearly as much from S. to N. But within these boundaries extensive countries are comprised, which so far from being settled by whites, are hardly visited by them, and are nearly unknown to geographers. This observation applies especially to all those wide-spreading countries which

extend along the numerous branches of the Rio Colorado. They have only been seen by a few wandering missionaries, who have given very unsatisfactory accounts of them. Even the mountain-range which bounds the basin of the Rio Colorado on the W. is so little known as to its extent and direction, that it cannot be laid down on a map. To the W. of this chain extends a sandy desert, from the N. extremity of the Gulf of California to the northern boundary of Mexico ($42^{\circ} 30'$), consequently about 700 miles in length. Its breadth at the southern extremity is about 100 miles, but it grows wider as it advances N., and may in some places be 200 miles and more across. Our information is limited to that portion of Upper California which, lying between this desert and the shores of the Pacific extends about 120 or 150 miles inland.

The mountain masses which constitute the peninsula of Lower California extend undivided as far N. as 34° N. lat. to the snow-capped peak of S. Bernardino, whose height has not yet been determined. North of this summit the mountains divide into two great ranges, both of which run N.W., and include between them the extensive valley of the Tule Lakes. The chain, which runs on the N.E. of the valley and divides it from the great desert, rises to a great height, a considerable part of it being covered with snow all the year round, which, between 36° and 37° N. lat., implies an elevation of about 10,000 feet above the level of the sea. But, except this circumstance, we are entirely unacquainted with these mountains. It is supposed that at 38° N. lat. they decline to the N.E., and join the Rocky Mountains in 40° or thereabouts. The range which extends to the S.W. of the valley of the Tule Lakes, and divides it from the seaboard, has its principal chain close to the valley, but several ridges branch off from it to the W., and thus form a number of longitudinal valleys, which are generally of very moderate width. The most remarkable is that ridge which branches off near S. Ines (35° N. lat.), and separates the Rio Buenaventura, or the Monterey river, from the coast. The mountains on the S.W. of the Tule Lakes terminate at the S.E. extremity of the bay of S. Francisco.

The two Tule Lakes occupy a considerable portion of the valley, extending about 100 miles in length, but their width is not known. At the end of the dry season they have so little water, that they are fordable at several places. Shortly after the rains, and whenever the snow on the adjacent mountains is melting, these lakes discharge a considerable volume of water by the river, which falls into the most S.E. corner of the Bay of S. Francisco; but after the vernal equinox the quantity of water thus discharged is very inconsiderable. The mountains which enclose the valley on the S.W. seem to advance close to the banks of the lakes; but those on the N.E. are at some distance, so that a tract of level or undulating land lies between them. This tract seems to be fertile, but is not yet cultivated, no agricultural establishment having been formed here.

The only settled part lies along the coast, the missions being nearly all within one day's journey from it. The settlements are generally not extensive, the valleys being in general narrow, and the mountains which enclose them too steep to be cultivated, though they supply pasture for a considerable part of the year. The most extensive valley is that of S. Gabriel, which is above 30 miles long, and of considerable width to the W., where it approaches the coast, and joins on each side the plains of S. Fernando and S. Luis Rey. The mountains are separated from the coast by a tract covered with low sand-hills, which in some places extend many miles inland.

The country about the Bay of S. Francisco seems to be the best portion of Upper California. Its soil is doubtless inferior to that of the valley of S. Gabriel, but the cultivable land occupies a much greater extent along the banks of the three rivers S. Joaquin, Jesus Maria, and Rio Sacramento, which fall into the bay. But the settlements in this part are not yet numerous.

Upper California partakes more of a cold than of a warm climate. The rainy season is from November to February. The rain is abundant in the northern districts, but decreases in quantity farther S.: at S. Diego, the southernmost of the missions, probably no rain at all falls, as in the N. of Lower California. The winter is much milder than in the same latitude on the E. coast of America. It does not appear that the Tule Lakes are ever covered with ice, nor is frost frequent in the valleys, though

the surrounding heights are covered with snow for a few months. The summer is very dry, no rain falling at all, except at Monterey, where there are sometimes, but rarely, slight showers. The heat is great, and the thermometer probably rises to 80° and more; but exact observations are wanting. On the banks of the Rio Colorado, at the extremity of the sandy desert, Dr. Coulter observed the thermometer rise to 140° in the open air.

The surface of Upper California being mostly covered with rocky mountains contains a very small proportion of arable land, but where the soil is arable it is usually rich. Maize and wheat are extensively cultivated: the former yields from seventy to eighty-fold, and the latter about seventeen-fold. Vines, and all kinds of fruit-trees that have been tried, thrive remarkably well, though they are sometimes destroyed by the locusts, which appear to breed along the coast in the sand-hills, and are carried inland by the strong N.W. winds. Most of the vegetables of Europe, especially the leguminous vegetables, grow well about the Bay of S. Francisco.

Black cattle form the principal article of produce. Though they were brought to California only seventy years ago, in 1827 the missions possessed 210,000 branded cattle, and it was supposed not less than 100,000 unbranded. About 60,000 are annually killed, and the hides, which are saved, form the principal and nearly the only article of export. Sheep are also numerous, but wool has not yet been exported. Horses and mules are only reared so far as is requisite for the consumption. Among the wild animals two are remarkable, the berenda, and an animal of the deer kind, which is distinguished by its great size, large horns, and great swiftness.

In minerals Upper California is not rich. A small silver mine was found E. of S. Ines, but it has been abandoned. In one of the rivers falling into the southern Tule Lake some gold has been found, but as yet in very small quantity.

Humboldt estimated the population of the missions of Upper California, according to official documents, at 15,600, at the end of the last century; the number of whites was then very small. Since that time great changes have taken place, and Dr. Coulter thinks the number of the white population cannot fall short of 6000, but at the same time he states that the aboriginal tribes are rapidly decreasing. According to other accounts however the number of the converted Indians amounted to 21,840 in 1824.

According to the missionaries, not less than seventeen different languages are spoken along the coast between S. Diego and S. Francisco. Langsdorf found that the country about the Bay of S. Francisco was inhabited by seven different tribes. The converts at that mission, though amounting only to about 1500, consisted of individuals collected from twenty different tribes, speaking different languages.

There are in this country four presidios, or military establishments, in each of which a small number of soldiers is placed, under the command of an officer. Each of them has to protect a certain number of missions, the number of which at present is twenty-one or twenty-two. Each mission contains a church, the dwelling-houses for two or three monks, some public buildings for the preservation of agricultural produce, utensils, and tools, and the houses of the converted Indians. The unmarried women are kept in separate houses, where they are occupied with spinning, weaving, and other manual work. Besides these missions, there are other places called pueblos (villages), in which invalid soldiers are settled with their families, and gain their livelihood by cultivating the ground.

The chief places are S. Diego, with a good but not deep harbour, whence large quantities of tallow and salted hides are exported; Monterey, the seat of the governor of Upper California, on a large bay, having good anchorage; and S. Francisco, on the bay of that name, which is very spacious, and from N.E. to S.W. extends upwards of sixty miles, with an average breadth of about twenty.

To the N. of the Bay of S. Francisco, and at a distance of about ninety miles, is the harbour of Bodega ($38^{\circ} 30'$ N. lat.), where the Russians formed an establishment in 1812, called Ross. (Venegas, *Hist. of Californ.*; Humboldt's *Essay*; Hardy's *Trav.*; and Dr. Coulter in the *London Geogr. Journal*, vol. v.)

The Botany of California is not much known: it appears however to be of a very peculiar character. The follow-

ing remarks apply nearly altogether to Upper California. Some noble pines, especially one called *Pinus Sabiniana*, with hard woody cones of an unusual size, have been discovered there; and herbaceous plants are in some instances strikingly different from those of any other country. Large numbers of *Polemoniaceae*, especially beautiful species of *Leptosiphon* and *Gilia*; some curious plants belonging to the genera *Nemophila* and *Emmenanthe*; several new genera of *Papaveraceae*, particularly *Dendromecon*, which is a shrub (!) looking like a *Cistus*; many kinds of *Eschscholtzia*, of *Lupinus*, of *Pentstemon*; an *Onagraceous* plant, intermediate as it were between an *Epilobium* and a *Fuchsia*, the *Zauschneria Californica* of Presl; and, finally, several kinds of *Calochortis*, *Cyclobotrya*, *Calliprora*, *Brodiaea*, and other bulbous plants, stamp the vegetation with a character quite unlike that of any other part of America.

CALIFORNIA, GULF OF, which was first visited by Hernando de Grijalva in 1534, extends along the W. coast of America, between the mainland and the peninsula of California, beginning on the S. between Cape Palmo in California (about $23^{\circ} 10'$) and the port of Mazatlan on the mainland (about $23^{\circ} 30'$), and extending N.W. to the mouth of the Rio Colorado (32° N. lat.). Its length is above 700 miles, and its breadth varies between 150 and 40 miles. To the N. of 27° it is hardly more than 80 miles across at any place.

Its W. shores are in general rocky and high, except to the N. of 30° , where the coast is sandy and flat. This low coast continues on the E. side of the gulf to the island of Tiburon, where it begins to be somewhat higher, and continues so as far as the mouth of the Rio Yaqui. From this point to the vicinity of Punta Arrieffes the coast is again low and sandy. At the Punta Arrieffes it is rocky, and lined with cliffs. Between this cape and the port of Mazatlan it is of moderate height, but in general not rocky.

This gulf contains pearl-fisheries. At the end of the sixteenth and the beginning of the seventeenth century a great number of valuable pearls were collected, but this branch of industry soon began to decline, and was almost entirely neglected. Different reasons were assigned for this circumstance, but we now know the true one. The pearl-beds were in a short time so exhausted or destroyed, that at present it does not pay the cost of bringing them up. The whole annual produce probably does not much exceed 1000. The pearl-banks are all situated along the high coast of Lower California, and none of them occur to the N. of $38^{\circ} 30'$. Salt is found in a lake on the island Del Carmin, which lies to the S.E. of the mission of Loreto in California. The island is uninhabited; but the inhabitants of Loreto and the other missions go there to collect it and to take it to the mainland.

seems to be plentiful, and among them are some enormous size, which are much dreaded by the pearl-divers. These are especially the *meros*, *tintareros*, and the sharks. The sharks, as well as seals, are most numerous to the N. of the island of Tiburon. Turtles and tortoises also abound, principally along the shores of the mainland and N. of Tiburon, where the shells of the latter are collected by the Indians. The aborigines who inhabit these coasts avail themselves of the abundance of fish, but the white inhabitants entirely neglect this branch of industry. The sea at the entrance of the gulf is much frequented by the spermaceti whale, and on that account is annually visited by a few English and American vessels.

The S. portion of the gulf is visited by a few foreign vessels, which supply the State of Occidente, and especially Sonora, with European goods, and take the produce of its copper-mines to China. These vessels go principally to the harbour of Guaymar (28° N. lat.). The same part of the gulf is also navigated by a few Mexican vessels, which carry Indian corn and maize to California, in exchange for the produce of the peninsula. A few small vessels are employed in the pearl-fishery. The northern portion of the gulf is seldom visited, the coasts being only inhabited by wandering tribes, who have nothing to offer in exchange. The navigation in the gulf is entirely interrupted in the month of September by the terrible hurricanes called *cordonzos* (gales), which blow at that time with great violence. (Hardy's *Travels*.)

CALIGULA, CAIUS CÆSAR, the fourth of the Roman emperors, son of Germanicus and Agrippina, was born in a Roman camp, in what place is uncertain. He was brought up among the soldiers; and is best known

by a nickname said to have been given him by these associates. The word *Caligula* is derived from *caliga*, a kind of shoe, which was worn by the common soldiers, and which he frequently wore himself in order to gain their affections. (Tacit. *Ann.* i. 41, 69.) The training and education which would have been suited to his rank appear to have been neglected. Caligula early devoted himself to observing the feelings and courted the favour of Tiberius, and by artful and unremitting attentions, he so far succeeded in ingratiating himself with the emperor, that he was soon promoted to responsible offices of state. The uncertainty of succession which followed the death of Tiberius, who was put to death probably by one of Caligula's favourites (Tac. *Ann.* vi. 50), together with the general popularity which Caligula himself enjoyed, afforded him a favourable opportunity of succeeding to the sovereign power (A.D. 37). His government began well, and with symptoms of great clemency: he set at liberty all the state-prisoners, discouraged informers, and promised the senate that he would act with the utmost moderation: he augmented the powers of the magistrates, and at least apparently curtailed his own. Soon afterwards he assumed the consulship, and chose for his colleague his uncle Claudius. During his consulship, Caligula gave many instances of mildness and generosity: among other things, he restored the Kingdom of Commagene, which Tiberius had reduced to a Roman province, to Antiochus, son of the former king. After about eight months, he fell ill, and the utmost anxiety was shown in inquiring for his health. His recovery was hailed with joy. His conduct, however, was soon changed. Caligula became addicted to intemperance and cruelty, and his extravagance knew no bounds. He took upon himself the highest titles of honour, and even had temples erected and sacrifices offered to him as a god. It seems probable that his grandmother Antonia died by his orders. According to Dion Cassius, he frequently visited the prison, and ordered all the captives, untried, guilty or not, to be thrown to wild beasts. Sometimes he would order a number of the spectators to be seized and thrown among them, after having had their tongues cut out, that their cries might not interrupt his ferocious delight. Old age and weakness rather attracted than averted his cruelty. He even put to death Macro, who had been the means of his elevation, and his wife with him. A favourite horse, *Incertus*, he fed with gilt oats and delicious wines: he appointed him a great number of attendants, and treated him with the most absurd attentions. He erected a bridge over the sea from Baia to Puteoli, on which he rode along, enjoying the sight of numbers of persons drowning under his order. He made great preparations for a war against the Germans, and crossed the Rhine with a large army, but returned without having seen a single enemy. He invaded and plundered Gaul, banished his sisters Agrippina and Livia, pretended that he was going to invade Britain, but returned, after he had got a few miles out to sea, and then on his arriving in Rome contented himself with an ovation. It is said that Caligula had a design to destroy the works of Homer, Virgil, and Livy.

[Brit. Mus. Actual size. Bronze, 450 grains.]

After a reign of three years, ten months, and eight days, and in the 29th year of his age, Caligula was murdered by a band of conspirators, headed by Cassius Chærea, a tribune, A.D. 41. (Sueton. *in vit.* c. 68.) The character of this emperor is pretty accurately given by Seneca (*De Ira*), who says that nature seems to have intended to show in the instance of Caligula how much harm can be done by the greatest vices leagued with the greatest power. Perhaps the true explanation of his proceedings is that he was insane. Caligula had several wives, but he left no children behind

him. The medal which is here given contains on the reverse the names of his three sisters—Agrippina (afterwards the wife of her uncle the Emperor Claudius), Drusilla, and Julia, who is called Livia or Livilla by Suetonius. (Dion Cassius, pp. 694, 717—763, H. Stephens, 1392.)

CALIGUS (Zoology). A genus of Pœcilopodous crustaceans, separated by Müller in which Latreille and Lamarck include the genus *Paracaligus* of Leach, but which Desmarest places under the fourth subdivision or race of Pœcilopoda: viz. those which have fourteen feet, of which the six anterior are unguiculate, the fifth pair being bifid with the last joints fringed with fine hairs in the form of cilia.

General character: body depressed, having its anterior portion covered by a membranous shell in the form of a shield, narrowed posteriorly. Abdomen narrower, of an elongated oval or nearly square shape, and terminated by two elongated antennæ-like processes cylindrical and simple. There are two small conical antennæ situated on the anterior border of the head, and directed laterally, and at the internal base of these are placed the two distant eyes. Beneath the head there is an obtuse beak.

Caligus, together with *argulus*, and other of its congeners of the family Siphonostomata, are commonly known among the fishermen as fish-lice. But *caligus* is without the cupping-glass-like suckers, by which *argulus* adheres to its slippery supporters; and the hooks of the anterior pairs of feet are the principal organs by which the former holds on to the fish.

Many naturalists have considered the tubular elongated antennæ-like processes of the posterior extremity of the body of *caligus* as ovaries or oviducts; and M. Surriray goes so far as to say, that having crushed these two processes in a *caligus elongatus* (?) which is very common upon the gill-cover of the gar-fish (*Esox Belone*), he extracted many transparent and membranous eggs, each inclosing a living fetus, very different from the parent. But Latreille evidently considers that there must have been some mistake, observing that he has frequently found the eggs beneath the posterior and branchial feet, but never in those tubes; and that such elongated oviducts are only seen in females, which deposit their eggs in holes or deep cavities, a habit which does not belong to *caligus*. Müller and others have remarked that these crustaceans raise and agitate these appendages; and Latreille agrees with the elder and younger Jurnes in thinking that they minister to respiration, like the appendages at the end of the abdomen of *Apus* [BINOCULUS].

We select as an example *Caligus Mülleri*, which is found upon the common cod, *Morhua vulgaris*.

[*Caligus Mülleri*, view of back.]

CALIPH, CALIPHAT. Caliph, properly *Khalifah*, is an Arabic word which primarily denotes a deputy, lieutenant, or vicergerent, but is generally used in a more limited sense, as the title of certain dynasties of Mohammedan sovereigns, regarded as the successors and representatives of the Arabian prophet Mohammed. It was first adopted by Abū Bekr, the immediate successor of Mohammed, and, together with *Emir al-Mūmanīn*, 'the commander of the faithful,' continued for several centuries to be the title of the principal line of Mohammedan sovereigns. The word Caliphat (Arabic, *Khilāfat*) is a general designation of the line of sovereigns caliphate, in a geographical sense, for the extent of their dominion. Disputes arose soon after the death of Moham-

med-as to the right of succeeding him in the command over the faithful, and several Mohammedan dynasties assumed the title of caliphs; hence it is that we hear of a Fatimide Caliph in Africa, and of an Qmayyade Caliph in Spain, flourishing at the same time with the Caliph of the Abbasides of Bagdad. The word in its usual acceptation is however confined to the Eastern dynasty of Mohammedan princes. It does not enter into our plan here to attempt a sketch of the history of the caliphate, for which we refer our readers partly to general articles, such as OMAYYADES, ABBASIDES, FATIMIDES, and partly to the biographical notices of distinguished individual Caliphs, such as ABU BEKR, ALI, HARUN, MAMUN, &c. We confine ourselves, on the present occasion, to a few remarks on the administration of the empire, and on its division into provinces.

The Prophet had enjoined his followers to spread the newly-established religion by waging war against those who refused to adopt it. This command, and the spirit with which it was obeyed by the fanatic zeal of the Arabs, established, within one century after the appearance of Mohammed, an immense empire, extending from the Pyrenees to the Indus, and uniting a motley variety of nations by the profession of one uniform creed, and under the authority of a sovereign at the same time spiritual and temporal, the caliph. The power and splendour of the empire reached its greatest height during the latter part of the eighth and the beginning of the ninth century of our era, under the caliphs Mansur, Harun-al-Rashid, and Mamun [ABBASIDES]; we may date its decline from the commencement of the tenth century, when many Mohammedan dynasties sprung up in different parts of the empire, who shook off their allegiance to the common sovereign; and even within the capital and the provinces that continued faithful, the authority of the caliph was diminished in consequence of the influence gained by the Emir-al-Omar, the commander of the Turkish body-guard.

Ibn Khaldun has preserved a memorandum of the annual revenue which the treasury of the caliphate derived from the several provinces of the empire during the reign of Mamun (A.D. 813—833). We subjoin a translation of this document, such as we find it in a Mauritanian MS. of Ibn Khaldun's prolegomena in the British Museum. (MS. No. 9574, fol. 162, verso, &c.)

The table begins with two provinces, the names of which we are unable to understand: the revenue derived from them is stated to be 37,750,000, and 14,890,000 dirhems. The other provinces are as follows:—1. Nejrân, 200 striped garments. 2. Sintân, 240 pounds (*rotl*) of terra sigillata. 3. Kesker, 11,600,000 dirhems. 4. Provinces along the Tigris, 20,800,000 dirhems. 5. Holwan, 4,800,000 dirhems. 6. Ahwaz, 25,000 dirhems, and 30,000 pounds (*rotl*) of sugar. 7. Fars, 27,000,000 dirhems, 30,000 bottles (*karat*) of rose-water, and 20,000 pounds of currants (*oranges zahib ul-uswad*). 8. Kerman, 4,200,000 dirhems. 9. Famen, 500 robes. 10. Sekwân, 400,000 dirhems. 11. Sind and neighbouring provinces, 11,500,000 dirhems, and 150 pounds of aloë-wood. 12. Segestân, 4,600,000 dirhems, 300 variegated robes, and 20,000 pounds of sweetmeats. 13. Khorasan, 28,000,000 dirhems, 2000 bars (*nokar*) of molten silver, 4000 baggage-horses, 1000 slaves, 27,000 robes, and 3000 pounds of balsam (*shilej*, Myrobalanus Chebula?). 14. Jorjân, 12,000,000 dirhems, and 1000 pieces (*shokkat*) of silk. 15. Kumis, 1,500,000 dirhems, and 1000 bars of silver. 16. Taberistân and Denyawend (?), 6,300,000 dirhems, 600 carpets, 200 garments (*asryat*), 500 robes, 300 towels, 300 *jdmât* (?). 17. Rei, 12,000,000 dirhems, and 20,000 pounds of honey. 18. Hamadan, 11,800,000 dirhems, 1000 pounds of preserved fruits, and 12,000 pounds of honey. 19. The country between Basra and Kufa, 10,730,000 dirhems. 20. Mâsindân, Mibrân, and the district of the mountains, 4,000,000 dirhems. 21. Shehrezûr, 6,000,000 dirhems. 22. Mosul and its territory, 24,000,000 dirhems, and 20,000 pounds of white honey. 23. Aljezirah, and the provinces along the Euphrates pertaining to it, 34,000,000 dirhems. 24. Azerbaijan, 4,000,000 dirhems. 25. Kerkh, 300,000 dirhems. 26. Ghilan, 5,000,000 dirhems, 1000 slaves, 12,000 leather bottles of honey, 10 robes of honour, and 20 garments. 27. Armenia, 13,000,000 dirhems, 20 carpets, 200 mules, 30 robes of honour, and two other articles which we cannot make out. 28. Kinnerm, 400,000 dirhems, and 1000 loads of currants (or raisins?). 29. Damascus, 420,000 dinars. 30. The district along the river Jordan, 96,000 dirhems. 31. Palestine, 370,000 dinars, and 300 pounds of currants.

(of raisins?). 32. Egypt, 1,920,000 dinars. 33. Yemen, 370,000 dinars, besides the go's noticed under No. 9. 34. Hejaz, 300,000 dinars. 35. Arká, 1,000,000 dirhems. 36. Africa, 13,000,000 dirhams.

Of the manner in which the government of the caliphs was organized we can as yet form but a very imperfect idea, since no Arabian historian has left us any connected account of it, and we must glean our information from what we find incidentally mentioned. The caliph is at the same time the supreme pontiff and the temporal sovereign of the empire, and from this twofold capacity Ibn Khallun deduces the five principal duties incident to the caliphate, viz., prayer, administration of justice, the passing of fetwas (i. e. the decision of matters under dispute which are not provided for by existing laws), war against the infidels, and the maintenance of order and security in the interior of the state. The caliph is the *imám* or first priest of the empire, conformably to the example given by Mohammed, who used to write public prayers before the assembled congregation of his followers. The preachers (*Wáiz, Khátib, Sheikh*) of the several mosques, who preach every Friday in the name of the caliph, are the delegates of the sovereign in this his pontifical character. As supreme judge of the empire, the several *cádis* are his responsible ministers, and the appointment of the latter is one of his principal duties: Omar is the first caliph of whom we find it mentioned that he appointed three *cádis*, at Medina, Basra, and Kufa. The passing of fetwas is the office of a separate class of judicial functionaries, the *muftís*. In his duty of extending the faith of Mohammed by waging war against the infidels, the caliph is assisted by the *emírs*, to whom he intrusts the command over the army and authority to conclude peace with the enemy: with these powers the governorship over conquered provinces is often united. Appointments of this nature can be traced as far back as the time of Mohammed, with whom likewise originated the custom of bestowing a banner (*sanjákh*) upon the person, in token of his office. For the purpose of maintaining order and security in the interior of the empire, the Abbassid caliphs (as well as those of Spain) established a body of guards, called the *shorta*, which was placed under the command of a judicial functionary, and had chiefly to watch over the due execution of the decisions of judges.

The two chief personal prerogatives of the caliphate (and of sovereignty in Mohammedan countries generally) are, the right of the caliph to have his name struck on the coinage of the empire, and to have it mentioned every Friday in the public prayers by the Khátibs or preachers throughout the country. In the history of Mohammedan Asia we find considerable importance attached to these two inalienable concomitants of sovereignty: they are the tacit expression of the public recognition of a new sovereign on his accession to the throne, as well as the sign of open rebellion on the part of a usurper, if either party has his name proclaimed from the pulpits in the mosques, or inscribed on the coinage of the realm. (Joseph von Hammer, *Die Länderverwaltung unter dem Chalífate*. Berlin, 1835. 8vo.)

CALIPPUS, CALIPPIC PERIOD. Calippus, of Cyzicus lived about 330 years B.C. He is said to have been a disciple of Plato. He observed at the Hellespont, and is said to have detected the error of the Metonic cycle by means of a lunar eclipse which happened six years before the death of Alexander. Very little more is known of him, and that little not worth stating.

The meaning of the *Calippic period* may be briefly stated as follows. Suppose a perfectly central eclipse of the moon to a spectator at the earth's centre, that is, suppose the centres of the sun and moon, and the junction of the moon's orbit with the ecliptic, or the node, to be all at the same point of the visible heavens. The revolutions of these three points, the sun's centre, the moon's centre, and the moon's node, would then begin, and a whole cycle of eclipses would take place, in a manner depending upon the relative motions of the three, until such time as the same phenomenon, namely the central lunar eclipse, again happened at the same node. After this, the cycle of eclipses would recommence in the same order, because all the circumstances of motion on which eclipses depend are recommencing. Thus if the second-hand of a watch were mounted on the same pivot as the minute and hour hand, would all be together at twelve o'clock, and all the

possible phases (appearances) which their relative positions could present would be completed in twelve hours, and then begin again. Next it is evident that, though such a coincidence of sun, moon, and moon's node never takes place, the period elapsed between two epochs at which the three are very near to each other will present a succession of eclipses which will nearly be repeated with nearly the same circumstances, in the next such

The cycle of Meton was composed of 235 lunations, or periods from new moon to new moon, containing very little more than 255 revolutions from a node to the same node again, about 254 complete sidereal revolutions of the moon, and 6940 days, or a few hours more than 19 years. This may be called a first approximation, and it is still sufficiently exact for finding Easter.

Calippus observed that a more correct period might be formed by taking four times the period of Meton, all but one day, or 27,759 days, or very nearly 76 years. This period contains 940 complete lunations, 1020 nodal revolutions, and 1016 complete sidereal revolutions; all very nearly. The Calippic cycle is therefore four Metonic cycles, all but one day. The analogy with the common and leap year will fix this in the memory. Calippus began to reckon his cycles from the new moon next following the summer solstice of the year A.C. 330, being the commencement of the 3rd year of the 112th Olympiad, A.U.C. 423, Julian period 4381, era of Nabonassar 418.

CALIXTUS, or KALLISTUS, I., one of the early bishops of Rome, succeeded Zephyrinus A.D. 219, and died in 223. Little is known about him; some say he suffered martyrdom, but this is doubted by others. One of the Roman catacombs, or subterraneous cemeteries, was named after him.

CALIXTUS II., son of William Count of Burgundy, succeeded in the see of Rome Gelasius II. in 1119, and died in 1124.

CALIXTUS III., Alonso Borja, a Spaniard and bishop of Valencia, was made pope after the death of Nicholas V. in 1455. He endeavoured to form a general league of the Christian princes against the Turks, in order to save Constantinople. He died in 1458, and was succeeded by Pius II. Calixtus was maternal uncle to Roderic Lenzioli Borja, whom he made cardinal, and who became afterwards pope Alexander VI.

There was another Calixtus, an antipope, who assumed the title of Calixtus III. in the schism against pope Alexander III. in the twelfth century, but afterwards submitted and resigned his claim.

CALLA, a genus of plants belonging to the *Arum* tribe, the most remarkable species of which, *C. Ethiopica*, is now referred to *RICHARDIA*.

CALLAN, partly in the barony of Kells and partly in the barony of Shillelogher in the county of Kilkenny in Ireland, a decayed borough 80 English miles S.S.E. from Dublin and 8 miles from Kilkenny city. Callan formerly returned a member to the Irish parliament, and at the time of the union George Lord Callan received 15,000*l.* compensation for the loss of the borough. The corporation consists of a sovereign, freemen, and burgesses, whose chief revenues arise from some very obnoxious tolls on all provisions entering the town. A town court is held here every Monday, with jurisdiction to the amount of 40*s.*; but there is neither gaol nor bridewell, nor any charitable institution, with the exception of a free-school under the superintendence of a committee. The population are principally Roman Catholic, and in the parish, town, and liberties amount to 6111, making 1205 families, of whom 580 are chiefly employed in agriculture, 349 in trade or handicraft, and 246 not included in either class, but chiefly paupers. The streets are unpaved, and the mail-coach is allowed twelve minutes extra in passing through. There is no inn in the town, and the state of poverty in which many hundreds of the inhabitants exist is truly frightful. On a mountain near the town is a stone bearing an inscription in Ogham characters which has been the subject of much dispute among Irish antiquarians. Callan is the property of Lord Clifden. (*Reports of Commissions on Municipal Corporations in Ireland; Inglis's Ireland in 1834.*)

CALLA'O, on the coast of Peru, in South America, is the sea-port of Lima, from which it is 7 miles distant by a good level road skirted on each side by trees. The bay is formed by the isles of San Lorenzo and Fronton, and a low sandy point projecting from the main, between which however

there is a safe passage half a mile wide, called the Vessels are well sheltered from all winds, except between the north and west, which seldom blow with violence. Callao is the safest and most convenient port, not only in Peru, but as far along the coast as Concepcion, in Chili. The sea is always tranquil, and there is anchorage every where in the bay from 7 to 10 fathoms, without any danger. A shoal extends about 400 yards from the beach, except immediately opposite the town, where a mole has been formed by sinking old hulks, within which vessels of large burden may lie and discharge their cargoes. During the war of independence they were secured by a boom across, and it was from this situation that Lord Cochrane so gallantly cut out the Esmeralda Spanish frigate. There is always a heavy surf on the beach, and to the southward of Callao point landing is seldom practicable, but within the mole boats may always land with safety and ease. Ships may obtain water from a small rivulet which runs through Callao and discharges itself within the mole, but the water is not good; it turns black, and has an unpleasant taste. Supplies of all sorts may be had in abundance—meat, live stock, vegetables, and fruit, cocoa, sugar, and spirits; but wood is very scarce.

The increasing commerce of Lima causes a corresponding influx of vessels from Europe into Callao bay, besides which there is great traffic with the other states of western America.

The town was originally built in the reign of Philip IV., and stood farther out on the point than its present site. In 1746 it was entirely destroyed by an earthquake, which demolished three-fourths of Lima itself; of the inhabitants about 4000 perished, and 19 vessels were lost, some of which were thrown to a considerable distance inland. Vestiges of the old town may still be seen on the point, buried in sand. Callao has been rebuilt on the same plan as before, but farther removed from the sea, and on a much firmer soil. The houses are flat-roofed and slightly constructed of cane wicker-work, plastered with mud, on account of the frequency of earthquakes, which take less effect on such frail edifices. The rare occurrence of rain in Peru, and its generally mild climate, render substantial dwellings unnecessary. Very heavy dews at night supply the want of fertilizing showers.

Callao itself consists almost entirely of the forts, barracks, custom-house, and other government buildings; the other houses, or rather huts, being chiefly pulperias (a low wine and chandler's shop): but the village of Bellavista, distant about three-quarters of a mile, offers more convenience for residence. The fortifications of Callao consist of two round castles connected by a curtain, and another on the point stretching towards San Lorenzo, all commanding the bay, towards which they present a battery of above sixty pieces of cannon, chiefly of large calibre. The principal fort was called San Philip, but is now named La Independencia; beneath its walls is the arsenal. Their great strength enabled the Spaniards to hold out long after Lima had fallen into the hands of the patriots, to whom however they ultimately surrendered in September, 1821, their supplies being cut off both by land and sea. Their fall may be said to have determined the independence of Peru.

A mile to the northward of Callao is the river Rimac, which passes through Lima, and six miles farther is another river called Carabaillo. Both of these streams run through a tract of very fine sand; they are not navigable even for boats.

The tides in Callao bay are very uncertain and irregular, being greatly influenced by the strength and direction of the wind. San Philip castle is in $12^{\circ} 4' S.$ lat., $77^{\circ} 4' W.$ long. (Various Voyages in the Pacific.)

CALLEIDA, a genus of coleopterous insects of the section *Francipennes* and family *Brachimida*.

This group was separated from the genus *Tarus* of authors, by Dejean, and is chiefly distinguished by the species having the penultimate joint of the tarsi bilobed.

Upwards of twenty species of this genus are enumerated in Dejean's catalogue, most of which are of brilliant metallic colouring, and inhabit the hottest climates, in both of which respects they likewise differ from the typical species of *Tarus*.

CALLEIER. [PERTHSHIRE.]

CALLET, JEAN-FRANÇOIS, born at Versailles, October 25, 1744. His mother was stated by a family tradition to have been of the family of Des Cartes. He came to Paris in 1768; in 1783 he published his edition of Gar-

diner's *Arithmétique* in octavo. In 1788 he was made Professor of hydrography at Vannes, and afterwards at Dunkirk. He returned to Paris in 1792, and was *professeur des ingénieurs au Dépôt de la Guerre* for four years. After the suppression of this place, he became a private teacher of mathematics. In 1795 he published his stereotyped logarithms, with tables of logarithmic sines for the new decimal division of the circle, the first which had then appeared. He died November 24, 1798.

The preceding dates and facts are from Lalande, *Bibliog. Astron.*, p. 805. The short account there given has been furnished verbatim by an anonymous writer to the *Biog. Univ.*, without acknowledgment.

The last logarithms of Callet (*Tables portatives de Logarithmes*, Paris, Firmin Didot, 1795) are still in general use, and are very convenient in many respects. The logarithms of numbers are arranged so that when the third figure changes, the line in which the remaining four figures are placed falls, so that the latter are opposite to their correct preceding figures. The logarithmic sines, &c., are to every ten seconds, sexagesimal as usual, the first five degrees being to every second.

CALLIANASSA (Leach), a genus of macrourous decapod crustaceans, the chela of which are very unequal both in form and in their proportions. The carpus of the largest chela is transversal, and forms a common body with the claw; the same joint of the other chela is elongated. The two posterior feet are nearly didactylous. The external foliation of the lateral fins of the end of the tail is larger than the internal. The carapace is slightly elongated, smooth, and terminated suddenly by a small beak. The abdomen is of considerable size, and nearly membranous. The other general characters are those of *Thalassina* [THALASSINA]. The only species known is *Callianassa subterranea*, which is found on the sands of the sea-shore washed by the tides, on the French and English coasts.

[*Callianassa subterranea*]

a, Intermediate antenna. b, External antenna. c, Right chela.

CALLIANIRA, or **CALLIANYRA** (Zoology), a genus of *Ciliograda*? established on no very sure foundations, by Péron and Lesueur, in their *Memoir on the Pteropoda*, and considered by them to belong to the type of the *Malacozoaria*, without sufficient evidence. Not that there is any very satisfactory proof of the actual state of its particular organization, though there is sufficient information to warrant the conclusion that in its general character it is not far removed from Berœ [BERŒ]. Lamarck, who perceived this relation, states that it was first established by Péron, in manuscript, under the name of *Sophia*; and the species described by him had, according to his account, a membranous gelatinous wing, divided into two large folioles provided with cilia on their margins.

De Blainville, who observes that callianira is only known by figures and descriptions not very complete in their details, states that Slabber's figure, copied by Bruguières, was drawn after an animal from the coast of Holland, and that the description was taken from another belonging to the waters of Madagascar; information which De Blainville acknowledges that he owes to Professor Vanderhoeven. De Blainville adds that M. Eschscholtz refers them to two different species.

The following is the generic character given by De Blainville:—Body regular, gelatinous, hyaline, cylindrical, elongated, tubular, obtuse at the two extremities, and provided with two pair of wing-shaped appendages, which develop themselves in large foliations, and are fringed with a double row of vibratory cilia upon their edges. A pair of tenta-

caliform appendages, branched, and apical. A large transverse opening at one of the extremities, and probably another smaller one at the other.

Example. *Callianura triploptera*.

[*Callianura triploptera*.]

CALLICERA (Meigen), a genus of insects of the order diptera and family Syrphidae, section *Athericera*. This genus is allied to *Ceria* of Fabricius, and differs principally in having the body shorter and wider in proportion, and silky. The second joint of the antennae is shorter than the last, and forms with it an elongated, compressed, slightly-curved club.

CALLICHOEMA, a genus of coleopterous insects of the section *Longicornes* and family *Cerambycidae*, distinguished from the allied genera (*Cerambyx*, *Phænocerus*, &c.) by having the maxillary palpi smaller than the labial, and shorter than the terminal lobe of the maxillae. The posterior tibiae are generally much compressed.

As in the genus *cerambyx*, the species of this genus emit a very agreeable odour.

CALLICHTHYS (Linnæus), a genus of fishes belonging to the section *Abdominal Malacopterygians* and family *Siluridae*; distinguished by the species having the body almost entirely protected by four ranges of large, hard, scaly plates: the head is also protected with plates of the same texture: the snout and under surface of the body are the only naked parts. The mouth is not deeply cleft, and is furnished with four long curri, two from each corner; the teeth are very small: eyes small, and situated on the side of the head.

The species of this genus generally frequent rivers and streams. Like eels, they can live for a considerable time out of water, and as they are natives of hot climates, the streams which they inhabit not unfrequently dry up: when such is the case they are said to perform long journeys over land, directing their course to some other stream. In some instances they bury themselves in the mud.

If we consider their structure, it certainly appears well adapted to such migrations, their large strong and bony pectoral fin ray being used as a propeller, and the large hard scales, which are serrated at the edges, would not only serve as a protection, but, from their disposition, would also help in propelling them through the herbage.

The genus *Callichthys* appears to be included in the genus *Cataphractus* of Willoughby and Ray and some others among the older authors.

CALLICRATES. [PARTHENON.]

CALLICRATIDAS, a Spartan officer who was appointed to succeed Lysander in the command of the Peloponnesian fleet in the *Ægean sea*, B.C. 406, at the beginning of the 24th year of the Peloponnesian war. Of simple, straightforward character, he was no match for Lysander and his friends in the arts of intrigue; and they used their best endeavours to perplex his plans, and frustrate all his opera-

tion. As the calling of Callicrates was concerned, he got over the difficulty by putting the simple question—whether they preferred that he should retain the command, or that he should sail home, and relate at Sparta the condition in which he found things: for none could stand the chance of accommodation at home. But, for the pay of his fleet, he was dependent on Cyrus [Cyrus], the Persian commander-in-chief of the king's forces in western Asia Minor; and when he went to that prince at Sardis to obtain a supply of money, he was so disgusted by Asiatic pride, and ceremony, and ostentatiousness, that, leaving the object of his journey unaccomplished, he returned to Miletus, saying that the Greeks were indeed miserable thus to cringe to barbarians for their money, and that if he lived to return home he would do his best to reconcile the Athenians and the Lacedæmonians. Having obtained a sum upon loan, he sailed to take Methymne by assault. The town was given up to loyle. Callicratidas was urged to sell the citizens for slaves, according to the usual practice of Greek warfare; but he replied, that while he had the command no Grecian citizen should be made a slave. This liberal sentiment, however, did not influence him in regard to the Athenians; for Xenophon (if there is no error in the text) says in the next line that the Athenians who formed the garrison were sold. (See the Note of F. A. Wolff on this passage.)

After this success Callicratidas met Conon, the Athenian commander, at sea; attacked him; gained a victory, and blockaded him in the harbour of Mytilene. Intelligence of this arriving at Athens, a powerful fleet of 110 ships was equipped and manned within the space of 30 days, and sent to the relief of Conon. Callicratidas left 50 ships to maintain the blockade, and with only 120 advanced to meet the enemy, whose number was increased by reinforcements from the allied states to 150 and upwards. The fleets met between Lesbos and the main land, near the small islands called Arginusæ. Hermon, the master of Callicratidas's ship, recommended the Spartan commander to retreat without hazarding a battle. He replied, that if he were dead Sparta would be no worse off; but that it was base to fly. The battle was long and doubtful, but ended in the complete defeat of the Lacedæmonians, with the loss of 70 ships. Callicratidas perished in it, being thrown overboard by the shock of his own ship against one of the enemy. (Xen. *Hellenics*, lib. i. c. 6.)

CALLIDIDIUM, a genus of coleopterous insects of the section *Longicornes* and family *Cerambycidae*. Technical characters: body depressed, thorax wider than the head, rounded at the sides; antennae generally shorter than the body; palpi rather short; the terminal joint thicker than the rest, and truncated at the apex. Legs short; femora and tibiae thickened towards the apex, especially in the males; tibiae simple.

Callidium Bajulus is not an uncommon insect in this country: it lives during the larva state in fir timber, and when it occurs plentifully is exceedingly destructive. The perfect insect is about three-quarters of an inch flattened elongate form, and dull black or pitch colour; the thorax is pubescent and has two smooth glossy tubercles on the disc; the elytra are furnished with a fascia (more or less distinct) of silvery white hairs.

Instances have been recorded of these insect boring the fir rafters of houses, to which they are of course very injurious, and we have known instances when the insect, in order to effect their escape, have perforated the lead with which the house-top was covered.

In many of the deal palings in the neighbourhood of London, and elsewhere, numerous oval-shaped holes (about a quarter of an inch in diameter) may be observed; these are formed by the perfect insect of this species of *callidium* to effect their escape, having passed through the larva and pupa states within the wood.

Mr. Stephens, in his 'Catalogue of British Insects,' enumerates thirteen species of this genus, but of these many have undoubtedly been imported in foreign timber.

CALLIMAGHUS, a Greek poet, was at the height of his reputation a little after the time of the first Punic war, 264 B.C. (Aul. Gell., xvii. 21, 41.) We learn from Suidas the following particulars respecting him. He was the son of Euphrates and Mesatima, was born at Cyrene, and studied under Hermocrates of Iastus. His wife was the daughter of one Euphrates, a Syracusan; he had a sister called Megatima, who married one Stasenor; the off-

spring of the marriage was a son, who bore the same name as his father, and wrote an epic poem of *Eleia* (*πρὸς ἑλεῖαν*). Callimachus, before he was taken into favour by Ptolemy Philadelphus, by whom he was highly honoured (Strabo, p. 838), kept a school in the quarter (*χωρὸν*) of Alexandria called *Eleia*, and had for his pupils Eratosthenes, Aristophanes of Byzantium, the celebrated grammarian, and Apollonius of Rhodes, the author of the *Argonautica*. He was alive when Ptolemy Evergetes ascended the throne, B.C. 247. This is the statement of Suidas (v. Καλλιμάχης). It appears from an epigram attributed to him (Jacobs, *Anthol. Palat.*, vol. i. p. 466) that his grandfather's name was also Callimachus; and the assertion of Suidas, that he was the son of Battus, is perhaps merely an inference from his epithet *Battiades*, which may be explained from the fact that he believed himself descended from the founder of Cyrene (Strabo, p. 837). Of his numerous writings only some hymns and epigrams remain. Of his lost works, which are most quoted, we may mention his *Healea*, a long poem (on which we refer our readers to the learned papers by Nake in the *Rheinisches Museum*, ii. 4, and iii. 4); his historical *Memorabilia*, which are also attributed to Zenodotus (Athen. iii. p. 95); a *Treatise on Birds*, also quoted by Athenæus; and a *List of all kinds of Writings* (*πινὰς παντοδαπῶν συγγραμμάτων*), which consisted of 120 books; so that he doubtless merited the epithet 'well-informed' (*πολύστοπος*), given him by Strabo (p. 438). He wrote an invective under the name of 'Ibis' against his scholar Apollonius, who had offended him, and the title was subsequently adopted by Ovid for a satirical poem of the same kind. [BERENICE.] As we might expect from the age and employment of Callimachus, his remaining poems display rather more of grammatical art than of poetical imagination, although they are not without that kind of beauty which is the result of much labour and learning. The first edition of the *Hymns of Callimachus* was by John Lascaris, Florence, 4to., probably printed about A.D. 1500: this edition is printed in capital letters. The latest editions are that by Blomfield, 8vo., Lond., 1816; and a small edition by Volger, Leipzig, 1817, &c.

CALLIMORPHA (Latreille), a genus of insects of the order *Lepidoptera*, section *Nocturna*, and family *Lithosiidae* (Stephens). Technical characters:—antennæ slightly ciliated in the males; palpi small, three-jointed; legs moderate, the hinder tibiae each with two pairs of spurs; body slender, especially in the males; wings large, somewhat triangular, with the hinder margins rounded.

Callimorpha jacobææ (the pink underwing), is a very beautiful and common moth: when the wings are expanded it measures about an inch and a half in width; the upper wings are of a greenish-black colour, with two round pink spots at the apex, and an oblong dash of the same colour extending nearly the whole length of, and parallel to, the outer margin. The underwings are entirely pink with the exception of the margins, which are of the same tint as the ground-colour of the upper wings. The head, thorax, abdomen, and legs are entirely black.

The caterpillar of this moth is not uncommon in the neighbourhood of London, but in some situations it is found in the greatest abundance in the month of June, feeding upon the flowers of the ragwort, and often upon groundsel. It is of a bright yellow colour, with numerous slender black bands, and is sparingly covered with hair. The moth appears in the month of May.

CALLINGTON. [CORNWALL.]

CALLIODON, a genus of fishes of the section *Acanthopterygii* and family *Labroides*. This genus was separated from that of *Scarus* (Linn.) by Cuvier, and differs in the species having the lateral teeth of the upper jaw divided and pointed; the upper jaw is also furnished with an inner range of small teeth. *Scarus spinidens* of Quoy and Gaimard is given as an example of this genus. [SCARUS.]

CALLIONYMUS, a genus of fishes of the section *Acanthopterygii* and family *Gobioidæ*.

The species of this genus are known in England by the name of *Dragonets*. Their branches have but a single small opening placed near the nape of the neck; their ventral fins are widely separated, larger than the pectorals, and situated under the throat: the head is oblong and depressed; the eyes are placed on the top of the head and rather close together: body smooth and without scales; in-
termaxillaries very protractile; teeth small, numerous, and

the anterior dorsal fin has the first rays elongated.

Two species of this curious genus (remarkable for the peculiarities of the pectorals and ventral fins, above noticed) are found on our coast: of these, the sordid *Dragonet* (*Dracunculus*) is the better known, being frequently met with at the mouth.

It is about ten inches long and of a reddish-brown colour; the head, pectoral and ventral fins are pale brown; the dorsal fins are of an immemorial pale brown.

The *Gemmeous Dragonet* (the other British species) very closely resembles the above described; and indeed has by been considered as the same species. There appears however to be very rating them, independent of the di or colour. The prevailing hue of this species is yellow of various shades, with sapphire stripes, and spots on the head and sides of the body. The ventrals and caudal fins are bluish-black.

This species has been found on various parts of our coast, as well as that of France. It occurs in the Mediterranean and on the coast of Norway.

[Gemmeous Dragonet.]

The *Dragonets* live at the bottom of the water, as might be supposed from the disposition of the eye. Their food consists of small shell fish and worms. They are sometimes caught by the shrimpers whilst fishing.

CALLIOPE. [MOSES.]

CALLIRHÖE (Zoology), a genus which, in the opinion of De Blainville, was ill characterized by Peron and Lesueur, and he adds that it would not be surprising if it should turn out not to differ from *Aurelia*. Eschscholtz places it under his fourth family, *Uruceidae*, of the *Cryptocarpa*, which forms the second section of his *Discophora*. Generic character:—Body circular, diversiform, furnished with cilia or tentaculiform cirrhi at the circumference, very much excavated below, with one orifice in the midst of four long and triangular appendages: ovaries four in number. Of the two species recorded, one, *Callirhœe Basteriana*, inhabits the German Ocean; the other, *Cal. micromema*, was found in the South Seas.

CALLISTHENES. [ALEXANDRIA.]

CALLISTUS (Bonelli), a genus of coleopterous insects of the family *Harpalidae* (Mac Leay). Technical characters: three basal joints of the anterior tarsi dilated in the males. Palpi with the terminal joint elongated, rather ovate, and terminated almost in a point. Antennæ filiform and slightly compressed. Labrum transverse, emarginated anteriorly. Head somewhat triangular. Thorax nearly heart-shaped. Body rather short and depressed.

Only one species of this genus has hitherto been discovered, but it is found almost all over Europe: it is not uncommon in France, and is found beneath stones. In England it is rather scarce.

This species (*Callistus lunatus*) is conspicuous in the cabinets of British insects from its beauty. It is about one-quarter of an inch long, the head and under parts of the abdomen are of a greenish black colour, the thorax is reddish yellow, and the wing-cases are yellow with six black spots, placed, two at the base, one on the disc of each elytron which extends to the outer margin, and two at the apex: these spots are large, and occupy about one-half of the whole surface of the elytra. The antennæ are black, with the two

* In the *Sordid Dragonet* the head bears the proportion of one to five of the whole length of the fish, and is of the form of an equilateral triangle: the distance between the eyes and the nape is only equal to one diameter of the former.

In the *Gemmeous Dragonet* the head is of an elongate form, and its length, compared with that of the fish, is as one to four: this species may also be distinguished from the former by its less depressed form.

basal joints yellow. The legs are black, with the base of the femora and tibia yellow. The head and thorax are very thickly punctured; the elytra are punctate-striated. The upper parts, with the exception of the head, are devoid of glossiness.

CALLITRICHACEÆ, a small natural order of *Achlymydeæ*, *dicotyledonous* plants, consisting of a few obscure, floating species, all of which belong to the genus *Callitriche*. The distinctive character resides in the presence of several one-seeded carpels, combined into a single pistil with two styles, and altogether destitute of any floral covering. Brown, and many others, consider the order related to *Haloragacæ*; but Lindley places it near *Podostemacæ*, and looks upon its affinity to other *dicotyledons* as being of the same nature as that borne by *Lemna* to *Monocotyledons*. (*Natural System of Botany*, second edition, p. 191.)

CARLOT, JACQUES, an eminent engraver, was born at Nancé, of a family recently ennobled, in the year 1593. His father, disappointed in his choice of a profession, he fled from home in order to make his way to Rome, the capital of the fine arts. Falling in with a troop of gipsies, he travelled in their company as far as Florence, where a gentleman, pleased with his ingenuous air, placed him with an artist to study; but he soon left him for Rome. At Rome he met some acquaintances of his family, who compelled him to return home. He ran away a second time, and was a second time brought back, by his elder brother, whom he met at Turin. During his youthful adventures, as the story goes, his morals were preserved uncorrupted, by his constant prayer that he might grow up a good man, excel in his profession, and live to the age of forty-three. He set out a third time, with his father's tardy concurrence, and studied for a long time at Rome. On his way homewards he was detained for many years by Cosmo II. After the death of his patron he returned to Nancé, married, and fixed his residence among his friends. He acquired considerable wealth, and his fame was such that he was invited to witness and perpetuate the events of the siege of Breda, and afterwards the sieges of Rochelle and Rhé; but he declined to commemorate the subsequent capture of his native place, and likewise refused a pension and lodging at Paris, offered to him by Louis XIII. He died March 28, 1635, of complaints incidental to the practice of his art.

His invention is lively and fertile, and he had a singular power of enriching a small space with a multitude of figures and actions. He engraved both with the burin and the needle; but his best works are free etchings, touched with the burin, delicately executed, and sometimes wonderfully minute. There is a want of unity and breadth of effect in some of his larger engravings, which is not surprising in one who did not practice painting, and engraved even fewer pictures than most of his profession, working chiefly from original designs. His principal works are the 'Sieges,' now-mentioned, the 'Miserics of War,' certain 'Festivities at Florence,' and a set of 'Capricci' (Felibien: Perrault.)

CALMAR, or **KALMAR**, a town in Sweden (about 56° 40' N. lat., and 16° 20' E. long.), in that portion of the ancient province of Smaland which now forms the political division of Calmar Län. The town itself is on an island called *Särholm*, in the straits, which divide the island of Oeland from the mainland, and are called the Straits of Calmar. It is united by a bridge to the suburb, which is on the continent. The suburb contains the old castle, in which the union of Calmar was agreed to in 1397, by which the three northern kingdoms were united under one sovereign. In one of its chambers the magnificent bed of Queen Margaret is still shown. The town is regularly built, but few of the houses are of stone, though there are excellent stone-quarries in the neighbouring island of Oeland. The most remarkable building is the cathedral, which stands in the middle of the great square. Calmar has a good grammar-school, and another for the lower classes, and also institutions for the instruction of poor children. The harbour is good, and the commerce of the town active, though less so than formerly. It exports the produce of the country—iron, alum, pitch, tar, boards, &c., and a great quantity of stone from the quarries of Oeland. Many vessels are built here; and the ships belonging to the town amounted in 1814 to seventy-five. There are four manufactories of snuff, and one of potash. The population is about 5000. (Schubert's *Reise durch Schweden*.)

CALMET, AUGUSTINE, was born at Mesnil-la-

Horgne, near Commercy, in the modern department of the Meuse, on Aug. 6th, 1672, and received the first rudiments of his education at the priory of Breuil; he studied rhetoric afterwards at Pont-a-Mousson. He afterwards entered among the Benedictines in the abbey of Stansuy, in the Fauxbourg of Toul, where he passed their vows in 1689. Greek, Hebrew, philosophy, and divinity engrossed his time until 1704, when he was appointed sub-prior at the abbey of Munster, in which he appears to have diligently pursued his biblical studies. In 1707 he published in French the first volume of his commentaries upon the Bible. In 1715 he purchased the priory of St. Lay from the Abbé Morel, the king's almoner, for a pension of 3600 livres, and three years afterwards he was appointed abbé of St. Leopold of Nanci. His priory of St. Lay was surrendered by him when, in 1723, he was chosen abbé of Ségonne, and he then also declined the title of bishop *in partibus infidelium*, which was offered to him by Pope Benedict XIII., at the suggestion of the college of cardinals. He died in his abbey on the 25th of October, 1757, greatly esteemed both for learning and for moderation. The following is a list of his principal works:—

'Commentaire Littéral sur tous les livres de l'Ancien et du Nouveau Testament,' 1707—1716. In 23 vols. 4to. Reprinted in Paris 1713, 26 vols. 4to. and 9 vols. fol.; and abridged in 14 vols. 4to. Rondet published a new edition of this abridgment, Avignon, 1767, 1773, 17 vols. 4to. The Dissertations and Prefaces belonging to his Commentary were published with 19 new Dissertations, Paris, 1720, 2 vols. 4to. 'Histoire de l'Ancien et du Nouveau Testament,' intended as an introduction to Fleury's Ecclesiastical History, 2 and 4 vols. 4to., and 5 and 7 vols. 12mo. 'De la Poésie et Musique des Anciens Hebreux.' Amst. 1725, 8vo. 'Dictionnaire Historique, Critique, et Chronologique de la Bible, enrichi d'un grand nombre de figures en taille douce qui représentent les antiquités Judaïques.' 'Dictionnaire de la Bible,' &c., 2 vols. 4to., Paris, 1722. 'Supplement à ce Dictionnaire,' 2 vols. 4to., Paris, 1728. Reprinted in 4 vols., 4to., Paris, 1730. This most valuable work was translated into English, under the title 'Historical, Geographical, Critical, Chronological, and Etymological Dictionary of the Holy Bible.' To which is added 'Bibliotheca Sacra,' or a catalogue of the best editions of the Bible, and commentaries upon it translated by J. D. Oyley and J. Calson, with cuts. London, 1732, 3 vols. folio. A new edition, to which the following work has been added, 'Fragments Illustrative of the Manners, Incidents, and Phraseology of the Holy Scriptures, intended as a continued Appendix to Calmet's Dictionary of the Holy Bible,' was published Lond. 1798, 1800, 2 vols. 4to. 'Histoire ecclésiastique et civile de la Lorraine depuis l'entrée de Jules César dans les Gaules jusqu'à la mort de Charles V. Duc de Lorraine; avec les pièces justificatives à la fin.' Nancy, 1728, 4 vols. fol. Reprinted 1745 in 5 vols. fol. 'Bibliothèque des Ecrivains de Lorraine,' 1751, folio. 'Histoire Universelle Sacrée et Profane,' 15 vols. 4to. This undertaking Calmet did not live to finish, and, in other respects, it is not his best work. 'Dissertations sur les Apparitions des Anges, des Démons, et des Esprits, et sur les Revenans et Vampires de Hongrie,' Paris, 1746, 12mo. Einsiedlen, 1719, 12mo; Paris, 1751, 2 vols. 12mo. Translated and published in English in 1759, 8vo. 'Commentaire Littéral, Historique, et Moral, sur la Règle de St. Benoît,' 1754, 2 vols. 4to. Perhaps the most useful of Calmet's works, certainly the one most familiar to the English reader is the 'Dictionary of the Bible.' All his works indeed are replete with learning, but should be read with some degree of caution. Calmet was deeply imbued with sacred and rabbinical theories. Though a man of great learning he had a strong leaning to the marvellous, and his tendency to superstition was not controlled by a sound judgment. Voltaire, in his usual lively manner, describes him as a man who does not think, but furnishes others with materials for thinking.

CALMS (at sea) occur at certain seasons in every part of the ocean, except perhaps the parts near the poles; but they seem to increase in frequency and duration as we approach the equator, and in the immediate vicinity of the equator there is an immense extent of sea, in which they are so prevalent that it has been called the *region of calms*. The calms, however, do not always occupy the same portion of the ocean, but they vary according to the position of the sun. When the sun is in the Northern hemisphere, they are sometimes found to extend as far as 16° N. lat., and

then the S.E. trade-wind passes four or five or even six degrees to the N. of the equator. When the sun is in the southern hemisphere, the calms also occur to the N. of the equator, but they come very near to it and sometimes reach it, whilst their northern border extends to 60° or 70° N. lat. Thus it appears that the region of calms does not extend on both sides of the equator, but is entirely in the N. hemisphere. In some seasons the calms extend over eight or even nine degrees of latitude; at others over a smaller space, and sometimes only over two and a half or three degrees. The average breadth of the region of calms may be between five and five and a half degrees. These remarks, however, refer only to the Atlantic Ocean, and for want of observations we are unable to decide whether or not they apply to the Pacific also.

In the region of calms which separates the N.E. and S.E. trade-winds the calms do not continue without interruption. Sometimes light breezes blow, especially from the S. and S.W. Besides this the calms are commonly interrupted every day by a wind which lasts a quarter of an hour or twenty minutes. After noon a black and well-defined cloud is formed near the E. horizon, which seems to announce a violent thunderstorm. The cloud increases, a wind suddenly rises, and blows with great violence for a few minutes. It is accompanied by a few drops of rain, but in a few minutes the rain ceases, the air resumes its clearness, and the calm returns. These daily squalls, though of short duration, enable the navigator to pass the region of calms, which even with this aid always proves very disagreeable. These calms, united to the immense quantity of fucus or gulf-weeds which is found W. of the Cape Verde Islands, may have given rise to the opinion of the ancients that the sea near the equator grows shallow, and becomes a swamp unsuited for navigation. (Horsburgh, *India Directory*; Rennell's *Invest.*; and Humboldt.)

CALMUCKS, or CALMACKS, is the name given by the Russians to one of the principal branches of that division of the Mongols which bears the general name of Olöth, or Oirat. This nation is more widely dispersed over the globe than any other, even the Arabs not excepted. Calmuck tribes occur over all the countries of Upper Asia between 38° and 52° N. lat., and from the most northern bend of the Hoang-ho to the banks of the Volga. We are acquainted with four principal branches. The Olöth inhabited chiefly the centre of these countries, to the S. and N. of the Thian-Shan range, in the present Chinese government of Ili, whence they extended their conquests over the neighbouring tribes during the seventeenth century, and founded an empire of great extent and power, which was destroyed by the Chinese emperor Kang-hi in 1698. Upon this event the name of Olöth merged in that of Zoongars, another numerous nation of the same origin, which inhabited the adjacent countries. The Zoongars also were for a short time formidable to the neighbouring tribes, especially the Khalkas, or proper Mongols: their empire was destroyed by the Chinese in 1757. By these continual and unsuccessful wars both nations have nearly been annihilated, and their names have nearly disappeared. The Torbod or Turbut, forming the third principal branch, had long before these events submitted to the Chinese emperors: and they still inhabit the countries about the lake of Koo-koo-nor, and along the Hoang-ho river, where it forms its great northern bend. They are considered and treated by the Chinese rather as allies than as subjects.

The fourth branch of the Olöth, which received the name of Calmucks from the Russians, is properly called Tuorgoot, and inhabited the countries W. of those of the proper Olöth. But during the continual wars which they had to wage with these more powerful neighbours, they began to extend their excursions towards the W., and at last settled, with the permission of the Russians, in the steppes which extend between the Volga and the Ural, in 1672. There they remained nearly a century. But in 1771, after having repeatedly been invited by the Chinese to return to their native country, the greatest part of them suddenly left the Russian territories, and returned, by a march of eight months, to the banks of the river Ili, where the countries whose inhabitants had been destroyed in the wars between the Chinese and Zoongars were assigned to them by the Chinese. Their number was estimated at 50,000 families, or 300,000 souls. The smaller portion of the nation remained in Russia. In the following year the remainder, as well as a small number of families belonging to the Olöth

Proper, who had taken refuge in Russia at the time of the destruction of their empire, also returned to the Ili. The number was about 30,000 families, or 180,000 souls, who were settled in the same country, between the Ili and the upper branches of the Irtysh. The number of families that remained in Russia was estimated by Pallas, in 1793, at 8229.

In the form of their body the Calmucks do not differ from the Mongols, and the language of the two nations perhaps not more than the Italian and the Spanish; but the proper Mongols have a rich literature, while that of the Calmucks seems to be limited to a few compositions or translations respecting the tenets of Bhuddism, a religion which has been embraced by all the nations of Mongol origin.

The Calmucks have no fixed abodes, but miserable huts, called kybitkas, which they carry from one place to another, in order to be always near the best pasture for their herds. They live entirely upon animal food, and do not cultivate the ground. They have large numbers of camels, horses, and sheep, but not many cattle. Their horses are of a middling size, very strong and swift. Their sheep are of the same kind as those of the Khyrgis, with large tails and good wool, of which the women make different stuffs for dresses, blankets, coverings for the kybitkas, &c.

They are not the immediate subjects of the princes in whose countries they live, but have their own hereditary chiefs, and an hereditary nobility, to whom they are much attached, and to whom they pay strict obedience. Their military or marauding excursions, to which they are much inclined, owing to their wandering habits of life, make them very troublesome to their neighbours. (Pallas; Ritter's *Asien*.)

CALNE, a parish, borough, and market-town in Wilts, in the hundred of Calne, 87 miles W. from London, on the Bristol road. It derives its name from being situated on a river called the Calne or Marden, which, after passing through the town, falls into the Avon. The parish contains about 8000 acres, and the population in 1831 amounted to 4795. The new parliamentary borough includes the parish and also those portions of other parishes which are surrounded by the parish of Calne. It returns one member to parliament; before the passing of the Reform Act it had returned two members from the 23rd of Edward I. with a few occasional interruptions. The municipal borough at present extends no farther than the old parliamentary borough did, not including the whole of the town.

This place is of remote antiquity; many Roman remains have been found in the neighbourhood, particularly in the hamlet of Studley, which was a Roman station. The West Saxon kings had a palace at Calne, and an hospital of black canons existed here. In 977 a synod was held here for adjusting the differences between the monks and the secular clergy, at which the celebrated Dunstan presided: the floor of the room gave way, and the whole assembly fell with it except Dunstan, whose preservation was attributed to the miraculous interposition of Providence on the behalf of the cause which he advocated. Calne is described in Domesday Book as 'Terra Regis,' and is called 'Cauna.'

The church is a large, lofty, and handsome edifice, well pewed, and lighted in a very superior manner with gas: it exhibits many different orders of architecture, having been built at various times. The tower, which stands at the N. side of the church, and contains a peal of eight deep-toned bells, is remarkable for the beauty of its proportions: it was built by Inigo Jones after 1628, in which year the tower and spire standing on the transept of the church fell. The living, which is a vicarage, with the chapelry of Cherhill and Berwick Bassett annexed, is in the presentation of the treasurer of the cathedral church of Sarum, and is in the peculiar jurisdiction of the dean of Sarum; it was one of the churches first given up by Bishop Oswald to the above cathedral on its foundation in the reign of William Rufus, and is rated in the king's books at *sl. 5s.* The present average net income, according to the *Ecclesiastical Revenue Report*, is 769*l.* The Marquis of Lansdowne is the lay proprietor. There are places of worship for various denominations of dissenters.

The town has lately been much improved, particularly by the introduction of gas, with which the streets are well lighted: the houses are substantially built with stone, which is found here in abundance. The public buildings, besides the church, are the town-hall, which was repaired a

few years since by the Marquis of Lansdowne, and given by him to the corporation; and the boys' school, a commodious and ornamental Gothic building, erected by subscription in 1829. The public schools are the grammar school, founded in 1660 by John Bentley, Esq., to which are attached two exhibitions in Queen's College, Oxford, given by Sir Francis Bridgman, Knt., in 1730; the Boys' British and the Girls' National Schools, supported by subscription, and Sunday schools for adults and children. A savings bank was established in 1816, and on November 24th, 1835, the amount standing in the names of 498 depositors was 17,669*l*. A court of requests for the recovery of small debts is held every six weeks. The manufactures are broad cloth and kerseymeres. A branch of the Wilts and Berks Canal comes up to the town. The market is held on Tuesday, and the fairs are on May 6 and September 29.

The air is salubrious, and the views of the adjacent country are very fine. At Cherhill, about three miles E. of the town, is the figure of a white horse, 157 feet in length, remarkable for the symmetry of its proportions, cut in the chalk down about the year 1780 under the direction of C. Allsup, Esq., surgeon. Rowood, the delightful residence of the Marquis of Lansdowne, is about a mile W. of the town. (*Continuation from Calne*)

CALOCHEPHALUS. [PHOCIDÆ.]

CALOCHEPHALUS, a beautiful genus of bulbous plants belonging to the natural order Liliaceæ, and nearly allied botanically to the fritillary and tulip, from both which it is immediately known by the sepals being of a different form, colour, and texture from the petals. Several species have been introduced into England from California, where or near which country they are exclusively found wild. Their exact localities, and the precise conditions of climate under which they occur, are however nearly unknown. It would appear that they inhabit a mild climate, subject to rains and a moderately high temperature during their season of growth, but dry and cool subsequently. Accordingly it is found that in this country they do not succeed very well, unless they are cultivated in pits where they are protected from frost and from water stagnating about their roots, and can be exposed freely to light and air when growing. They are so exceedingly impatient of wet near their bulbs when not in a growing state, that prudent gardeners take the precaution to dig them up and keep them dry, from the time when the leaves are withered to the recommencement of their vegetation. When they are replanted, they will scarcely bear any water until the young leaves begin to appear above the soil. Several species are figured in the latter volumes of the 'Transactions of the Horticultural Society,' and in the 'Botanical Register.'

CALOMEL. [MERCURY.]

CALOMNE, M. DE, born at Douai about the middle of the last century, studied the law, in which he distinguished himself, and was made successively attorney-general to the parliament of Douai, intendant of Metz, inspector-general of finances, treasurer, lastly minister of state. He found the finances in a state of great embarrassment, and being unable to fill up the deficit, he advised Louis XVI. to convoke the assembly of the notables in 1787, before whom he made his well-known statement of the financial affairs of the kingdom. Being taxed with prodigality and malversation he was dismissed by the king, and was succeeded by Brienne. Calonne retired to Flanders, and afterwards to England, where he spent the greater part of his latter years, and wrote numerous political and financial pamphlets. Although belonging to the royalist party he was not extravagant in his opinions, and he therefore incurred the enmity of the more violent royalists. His 'Tableau de l'Europe en Novembre,' 1795; 'Pensées sur ce qu'on a fait et ce qu'on n'auroit pas dû faire,' 1796; 'Des Finances publiques de la France,' 1797, &c., afford materials for the history of those times. In 1802 he signed leave of Bonaparte to return to France, where in October of the

few years since by the Marquis of Lansdowne, and given by him to the corporation; and the boys' school, a commodious and ornamental Gothic building, erected by subscription in 1829. The public schools are the grammar school, founded in 1660 by John Bentley, Esq., to which are attached two exhibitions in Queen's College, Oxford, given by Sir Francis Bridgman, Knt., in 1730; the Boys' British and the Girls' National Schools, supported by subscription, and Sunday schools for adults and children. A savings bank was established in 1816, and on November 24th, 1835, the amount standing in the names of 498 depositors was 17,669*l*. A court of requests for the recovery of small debts is held every six weeks. The manufactures are broad cloth and kerseymeres. A branch of the Wilts and Berks Canal comes up to the town. The market is held on Tuesday, and the fairs are on May 6 and September 29.

CALMET, AUG.

CALOSOMA, a genus of Coleopterous insects, of the section *Geodophaga* (Mac Leay), and family *Carabidae*. Technical characters:—Three basal joints of the anterior tarsi, in the males, much dilated, the middle one slightly so; antennæ with the third joint longer than the first; labrum bilobed; mandibles simple, slightly curved, and transversely striated; thorax short; legs generally rather broad and short.

This genus is very closely allied to the true Carabi; indeed so much so that it is difficult to point out any very tangible distinguishing characters; and yet the entomologist is seldom puzzled in separating them, even without close examination.

There is a considerable difference in the general appearance of the species of the two genera, and we think this in a great measure arises from the comparative proportions of the head and thorax. In *Calosoma* these are always smaller, and considerably shorter in proportion to the body (which is generally broad) than in *Carabus*. The eyes are usually more projecting, and M. Dejean mentions the larger sized jaws, and their being always transversely striated, as a good distinction.

To the genus *Calosoma* belongs our largest and most beautiful British Carabidæous insect, the *C. sycophanta*. It is about an inch long; the head, thorax, and parts of the body are of a beautiful blue colour, the elytra are green, with red reflections more or less conspicuous in different examples; the legs and antennæ are black.

Most of the best British collections contain this insect, and some even several specimens: it must nevertheless be considered a rare insect in this island, hardly ever more than one specimen having been found at one time. In France and Germany it is not uncommon, and is found in woody districts: most of the British specimens have been taken on the sea coast.

[*Calosoma Sycophanta*]

C. inquisitor is the only other species of this genus found in this country: it is about three-quarters of an inch in length, and of a bronze or brassy green above, and black beneath. This species, though by no means common, is far more abundant than the last. It has been frequently met with crawling up the trunks of oak trees in the spring of the year, about the time that that tree begins to put forth its leaves; most probably it feeds upon the young caterpillars, which are then abundant.

Unlike most genera of insects, this appears to be confined to no particular quarter of the globe, species having been met with in almost all countries. About thirty species are known; their prevailing colours are various shades of green, generally of a brassy hue, and sometimes black.

CALOTES. [IGUANIDÆ.]

CALOTROPIS GIGANTEA (R. Brown), *Calotropis mudarii* (Buch.), *Asclepias gigantea* of Linnaeus. The *Mudar*, a plant common in sandy places in many parts of India, has a milky juice in its stem, which, as well as the bark of the root, enjoyed such reputation among the native practitioners as a medicinal agent as to lead to its use among European practitioners in the East. It was found to be very efficacious in the cure of many obstinate cutaneous diseases, such as leprosy, scabies, and elephantiasis; in syphilitic complaints also, and, indeed, it proved so valuable an alternative that it was used in the place of vegetable mercury. Some use the powder of the bark of the root, but Sir Whitehead Ainslie says the fresh milky juice, which in a recent case, if taken in large quantity, is poisonous. It

was thought to possess some specific quality, but Sir Duncan, by whose extensive trials were made of it in Britain, showed that this is not correct, but that it is infinitely more valuable as a common medicinal property, which corroborated in every respect, according to him, both in kind and degree, in those of ipecacuan. He even thought that, from the facility with which any quantity could be procured from the province of Bahar, the use of the ipecacuan might be altogether dispensed with in our East Indian settlements.

Besides its practical value as a medicinal agent, the bark of the root possesses the singular property in one of its constituents, *Mudarine*, of being very soluble in cold water, gelatinizing when the solution is heated to 85° or 90° Fahr., and recovering its fluidity on cooling. It is the only instance known of any organic body being an exception to the general law of the power of solvents being increased by an increase of temperature. For this reason we here describe the mode of obtaining it, and give a brief sketch of its habitues. *Mudarine* is obtained in a state of considerable purity from the tincture of mudar, by macerating the powder of the root in cold rectified spirit. The greater part of the spirit may be recovered by distillation, but the remaining solution, which acquires a much deeper colour though it remains perfectly transparent, is allowed to cool. As the temperature falls, a granular resin is deposited by a species of crystallization from a transparent coloured solution. The whole is allowed to dry spontaneously, in order that all the resin may concrete. The dry residuum is then treated with water, which dissolves the coloured portion, and leaves the resin untouched. It is to this principle, dissolved by cold water from the resinous extract, that the name *Mudarine* is given. It has no smell, and is intensely bitter, with a very peculiar nauseating taste. It is exceedingly soluble in cold water at the ordinary temperature of the atmosphere, but insoluble in boiling water. It is soluble in alcohol, but the power of this solvent is increased by increase of temperature. It is insoluble in sulphuric ether, oil of turpentine, and olive oil.

It is in the solution in water when nearly saturated that the peculiar property of *Mudarine* is most easily exhibited. At ordinary temperatures this solution is quite fluid and transparent. When heat is gradually applied, already at 74° Fahr., a change in its constitution begins to be observable, indicated by a slight diminution of its transparency. As the temperature is raised these changes increase, and at 90° it has lost a great degree of its transparency, and has acquired the consistence of a tremulous jelly. At 95° it is fully gelatinized, and a separation of it takes place into two parts, a soft brownish coagulum, and a liquid nearly colourless. At 98° the coagulum is evidently contracted in size. At 130° the coagulum seems to dissolve: at 185° the coagulum is very small, and has a tenacious, pitchy consistence. At 212° little further change occurs. The alterations which in this state it undergoes on cooling deserve to be noticed. At 140° the fluid is very turbid: the coagulum has not diminished in size, and is now very hard and brittle. At 110° fluid less turbid, coagulum remarkably brittle, with a resinous fracture: at 100° fluid more transparent. When cooled down even to the freezing temperature the coagulum remains unaltered, and very much resembles colophony; but after the lapse of several days it gradually liquefies in a portion of fluid in contact with it, without passing through the intermediate state of a jelly.

(*Ainslie, Materia Indica*, vol. i. p. 486; *Duncan in Edin. Med. & Surg. Journ.* July, 1829; and in *Trans. of Royal Soc. of Edinb.*, vol. xi. p. 433.)

CANOTSA (also *Kolotza* and *Kolosca*), an archiepiscopal town, situated in a marshy flat on the Vayas, an insignificant arm of the Danube, in the county of Pesth, in Western Hungary. This place was known to the Romans, and was of much greater importance before the Turks overran the country. It has several handsome public buildings, the most spacious of which is the archbishop's residence, with a spacious library; a chapter-house and cathedral, an ecclesiastical seminary on a large scale; a college and gymnasium of the Jesuit order, &c. The gardens attached to the archbishop's seat are fine; there is an artificial hill in them laid out as a theatre. The inhabitants, about 7400 in number, are engaged in agriculture on the Danube, and rear much cattle. 46° 45' N. lat., 19° 3' E. long., about seventy-four miles south of Vienna.

CALOYER (*Caloyers*), the name given to

monks, from *kalos* and *geras*, meaning comely, venerable, old age. They are mostly of the order of St. Basilus, and inhabit convents the principal of which are on Mount Athos. They are bound to celibacy, which is not the case with the secular clergy or the Greek church. The Caloyers abstain from meat five four Lents in the year, besides other fasts, at times they abstain also from butter, eggs, and fish, and live only upon bread, vegetables, salt, &c. There are also convents of female Caloyers.

CALPE. [*DIPHYDES*.]

CALPE. [*GIARALTA*.]

CALPENTYN GULF, on the N.W. coast of Ceylon. This gulf separates the main land of Pomparippo and that of Putlam from the peninsula of Calpentyu. It is rich in chanks of the best quality, and in *bicho de mer*. It is plentifully stocked with fish, and supplies water to the salt-pans at Putlam and in the Akkarapattoo.

CALPENTYN TOWN, a peninsula town on the W. side of the gulf of that name, about 93 miles N. of Colombo. It was antiently called *Arasadi*, but the natives now call it *Kalpattu*. It has a small square fort built by the Dutch in 1646, containing several handsome buildings, which are at present unroofed and in ruins, except one occupied as the commandant's house, some others used as stores for salt, arrack, and paddy, and one as a prison. The town, situated at a small distance from the fort, contains, besides the mud-thatched huts, only a few large houses roofed with tiles. The extensive groves of cocoa-nut trees with which it is stocked, and the rich foliage of the *Leobria*, forming a hue on each side of the road leading to the bazaar, give it a pretty appearance. In the town and its vicinity are eight places of worship: one Protestant, one Roman Catholic, three Gentoo, and three Mohammedan. It has a charity-school supported by government. The Protestant church, though built of clay and thatched with olus, has stood for nearly two centuries.

The harbour, on account of many shoals, is not accessible to vessels exceeding 100 tons, even at the highest spring tides, so that they are obliged to lie in the Dutch bay at Mutwal, and unload and convey their cargoes to Calpentyu in small boats (*dhonies*), of which there are a great number belonging to the place.

The exports from Calpentyu to Madras and other ports on the Coromandel coast are copperahs (the edible part of the cocoa-nut, prepared by being dried in the sun to have the oil expressed), cocoa-nuts, oil, shark's fin, fish rope, honey, bees' wax, ghee (clarified butter), fish oil, wood oil, daumer, moss, chaya roots, and palmyra timber. The imports consist of cloths, paddy, rice, crockery, hempen thread, spices, minerals, and drugs. The opening of the new canal between Chilaw and Colombo has proved very beneficial to the inhabitants of Calpentyu, and the trade by means of inland navigation is rapidly increasing. A great number of canal boats (*ballams*) are constantly employed in conveying to the market of Colombo copperahs, salt fish, fish roes, dried shrimps, ghee, in return for the china ware, English cloth, sugar, dates, jackwood planks, tiles, bricks, iron, lead, and a variety of other articles.

The inhabitants are composed of Malabars, Europeans and their descendants, Javanese, and Mohammedans: their number, according to the census of 1831, amounts to 2498. The soil in the vicinity, though very sandy, yields in productiveness to that of few parts of the island. In and about the town are 580 groves of cocoa-nut and palmyra trees. The gardens produce every vegetable and various kinds of fruit. Amongst the latter are mangoes, bananas, guavas, papayas, bilbas, pomegranates, citrons, shaddockes, bread fruit, and grapes. The last are produced in great perfection.

The fisheries of Calpentyu have greatly increased within the last few years by the influx of fishermen. The estimated value of the fish caught in 1827 was 18117. The gulf is rich in chanks of the best quality, and in *bicho de mer*. The latter is occasionally collected and exported to the markets of Singapore and Penang by the Chinese merchants. Chaya roots, fish than can be met with elsewhere, are produced in the neighbourhood; and a species of wood is found here, from which the *wood oil* is extracted. A large quantity of lime is made from shells found here in great abundance.

Calpentyu was probably once the site of an opulent city. Knox describes it as one of the fortified places. The Por

tuguese took possession of it in 1544; the Dutch wrested it from them in 1640; and the British regained it in 1795, and have retained possession of it ever since.

CALPURNIUS, TITUS JULIUS, a Latin poet and a native of Sicily, has left eleven eclogues, written somewhat in the manner of Virgil's, whom he seems to have imitated. He lived in the third century, and enjoyed the favour of the emperor Carus. His Latinity is better than his taste, and his language more tolerable than his subject or his mode of treating it. [BUCOLICS.] These eclogues have been often edited, and are printed in the 'Poetæ Latini Minores' of Burmann.

CALTHA, a genus of Ranunculaceæ plants: two species are met with in this country, one (*C. palustris*) commonly in meadows, and by the side of wet ditches. It is very much like a Ranunculus, from which genus *Caltha* chiefly differs in having a calyx and corolla mixed together, no scale at the base of the petals, and many seeds in each carpel. It partakes of the acidity of Ranunculus itself.

CALTRAP, commonly called Chausse-trape or Crow's-foot, a piece of iron formed with four points, each about three inches long, which are so disposed, that, when the piece is thrown on the ground, one of them will stand upwards. In warfare crow-feet are sometimes scattered about in order to impede the march of cavalry.

CALTURA, a district extending along the S. coast of Ceylon, subordinate to the collectorship of Colombo. Its greatest length from S.E. to N.W. is 38 miles; its breadth from E. to W. 11 miles. It is one of the most healthy and populous districts of Ceylon. The soil is remarkably fertile, the low lands producing three crops of paddy in the year; and the high lands are covered with groves and plantations of cinnamon, cocoa-nut, areca, and other trees. The cocoa-nut tree affords the means of carrying on an extensive distillation of arrack, and the manufacture of cordage and jaggery (or coarse sugar). When the census was taken in 1814 it contained three korles, ten pottans, and 368 villages, and 53,944 inhabitants; of whom were 28,662 Protestants, 6,950 Roman Catholics, 6,364 Mohammedans, and 12,018 Buddhists.

CALTURA TOWN, the principal town of the district of the same name in the island of Ceylon, situated on the left bank of the Kaluganga river, about 25 miles S. from Colombo; 6° 42' N. lat.: 79° 54' E. long. It has a small fort standing on a neighbouring mound commanding the river, but it is not now garrisoned. It contains about 200 tiled houses. A great number of Jutra Dhonies belong to this port, which trade to Madras and other places on the Coromandel coast. The Wesleyan missionaries have built a handsome chapel and school-house here. There is also an excellent rest-house for travellers, much frequented in consequence of its being in the high road to Galle.

This town is the seat of an assistant government agent, who is also an assistant judge. Its climate is remarkably pleasant and salubrious, and it is therefore a favourite resort of invalids from Colombo. The inhabitants consist of Europeans and their descendants, Cinghalese, and Mohammedans.

CALUMBO, or **KALUMBO-ROOT**, the bitter tonic root of an African plant called *Cocculus palmatus*. [COCULUS.]

CALUMET, the name given by the North American Indians to a pipe for smoking tobacco. In Harris's 'Voyages,' vol. ii. p. 203, the following description of this pipe is given:—'The calumet or pipe of peace is a large tobacco pipe, with a bowl of polished maple, and a stem two feet and a half long, made of strong reed, adorned with feathers and locks of women's hair. When it is used in treaties and embassies, the Indians fill the calumet with the best tobacco, and presenting it to those with whom they have concluded any great affair, smoke out of it after them.' To refuse the calumet is a sign of hostility. It is offered to strangers as a mark of hospitality; and to smoke the calumet of peace literally signifies, in the language of the North American Indians, 'to be on terms of friendship and alliance.'

CALVADOS, a department in the north of France, on the coast of the English Channel, forming part of the ancient province of Normandie. A remarkable ridge of rocks runs along the coast of France in this part, extending E. and W. about 14 or 15 miles, and ranging a mile or a mile and a half from the shore. (Map of France by Maraldi and Cassini de Thury.) Upon this ridge one of the vessels of the Invincible Armada sent by Philip II. of Spain against

England (A.D. 1588) suffered a wreck. The vessel was called Calvados, and the name was first imparted to the rocks, and has since been given to the department, which includes the coast over against them.

The department is in the form irregularly quadrilateral. Its greatest length, measured nearly E. and W., is about 69 or 73 miles; its greatest breadth, nearly N. and S., 46 miles; its surface amounts to 1,409,606 acres, or about 2202 square miles, being rather below the average extent of the French departments, and rather larger than the English counties of Derby and Stafford taken together. It is included between 48° 46' and 49° 25' N. lat., and 0° 26' E. long. and 1° 10' W. long. It is bounded on the N. by the sea, on the S. by the department of Orne, on the E. by that of Eure, and on the W. by that of Manche. Caen, the capital of the department, is 122 miles W. by N. of Paris in a straight line, 60 or 134 miles by the road through Mantes, Evreux, and Lisieux. The population of the department in 1832 was 494,702, or between 224 and 225 to a square mile.

This department has a very high hills. It is crossed just at its S.W. extremity by the range of high land which separates the basin of the Loire from that of the Seine and the Orne, or rather by a secondary range extending from this into the peninsula of Cotentin. It is traversed by several streams, all nearly in the same direction, viz. from S. to N. The Vire, near its mouth, and its tributary the Elle, form the western boundary of the department separating it from that of Manche; the Esque, the Tortonne, and the Aure l'ulérieure, unite their streams and flow into the estuary of the Vire; the Drome united with the Aure (which passes Bayeux); the Seule; the Orne (which passes Caen); the Dives; and the Touques (which passes Lisieux and Pont l'Évêque), successively occur as we cross the department from W. to E. Of these rivers the Vire, the Orne (to Caen), the Dives (to Troarn), and the Touques (to Lisieux), are navigable: the Orne, which is the longest, has a course of about 80 to 90 miles. On the E. the department just reaches to the mouth of the Seine. There is a salmon fishery in the Vire. There are no canals. The high road from Paris to Cherbourg crosses the department through Lisieux, Caen, and Bayeux; and there are roads from Caen to Avanches (Manche), Vire, Domfront (Orne), and Falaise.

In its agricultural productions this department holds a high place. There are extensive tracts of meadow land, affording excellent pasturage to a prodigious quantity of cattle. According to the statements of M. Dupin (1827) the department contained nearly 100,000 head of cattle, of which by far the greater number were cows. The dairy is much attended to; and a great quantity of butter, salt and fresh, is made. At Isigny, which is the centre of the trade in this article, and the port from whence it is exported, it is said that the annual produce of salt butter is 100,000 pots, valued at 1,500,000 fr. or 62,500*l.* (Encyclop. Méthod. 1809.) Many sheep are raised, though in the number of these the department is below the average of France: M. Dupin gives the number of sheep at above 300,000, of which from 12,000 to 13,000 were merinos. The horses of this district are very fine: the breed had much degenerated during the revolution, but is now recovering; the number, according to M. Dupin, is above 50,000, nearly double the average number in the departments. Poultry, game, and fish are plentiful. The grain harvests are copious: the average produce of wheat is nearly double that of the average of the departments, being about 400,000 quarters; the average produce of other kinds of grain is as follows: buck-wheat, 144,000 quarters; barley, 130,000 quarters; oats, 85,000 quarters; rye and mixed corn, 80,000 quarters. There is a considerable export of wheat, but the supply of oats does not equal the consumption. No maize is grown, and not many potatoes. To these articles of produce we may add peas, beans, kidney beans, flax and hemp; dyeing herbs, such as madder, wood, and dyers' weed or weld; fruit, especially apples, from which much cider, the common drink of the inhabitants, is made. Perry is also made, and brandy is distilled from cider. The vine is not cultivated. Salt provisions form one article of trade in the department. The quantity of wood is small: some coal is dug, and some more is imported by sea or by the river Seine. Besides coal, the mineral treasures of Calvados comprise slate, copper, and iron: there are springs and mineral waters.

The department is subdivided into the six arrondissements

of Bayeux, N.W., population 89,414; Caen, central, pop. 135,502; Falaise, S., pop. 62,349; Lisieux, S.E., pop. 68,716; Pont l'Évêque, N.E., pop. 57,326; and Vire, S.W., pop. 30,996. The department is comprehended in the jurisdiction of the *Cour Royale* of Caen. The number of deputies in the Chamber sent by the department is seven. Calvados has one Académie Universitaire (Caen) and one episcopal city (Bayeux), the diocese of which comprehends the department.

The chief towns are Caen the capital, on the Orne, pop. 37,019 for the town, 39,140 for the whole commune; Lisieux, on the Touques, pop. 10,257; Bayeux, on the Aure, pop. 9934 for the town, 40,303 for the whole commune; Falaise, on the Aube, a feeder of the Dives, pop. 9419 for the town, 9581 for the whole commune; Honfleur, at the mouth of the Seine, pop. 8409 for the town, 8588 for the whole commune; Vire, on the river of the same name, pop. 7500 for the town, 8043 for the whole commune; and Condé, on the Noireau, a feeder of the Orne, pop. of the town 4904, of the whole commune 5562. For an account of these towns the reader is referred to their respective articles: the smaller shall briefly notice here.

L'Évêque, on the Touques, is a small town and ill built, with only 1843 inhabitants for the town, or 2118 for the whole commune; yet it is the capital of an arrondissement, and for its size a busy place. A considerable quantity of cotton goods are made here, and some hosiery. There is a sugar-refining-house, and vitriol and copperas are manufactured. There is a high school of good reputation.

Isigny, at the mouth of the Vire, on the right bank, has a population of about 2000. It is famous for the butter, which being made in the neighbourhood is exported from this place chiefly to Paris. The surrounding district is famed for its cider; and the country from Isigny to Bayeux presents a prospect of almost unequalled beauty. Trevières, between Isigny and Bayeux, is famous for its salt butter.

Orbec, on the river of the same name (which joins the Touques at Lisieux), has factories for making light woollens, ribbons, &c. There are some bleach-grounds and tan-yards. The population of the commune in 1832 was 3209.

Vassy, between Vire and Condé sur Noireau, had in 1832 a population of 3243.

The chief manufactures of the department are cotton and woollen goods, lace, hosiery, leather, oil, and paper.

This department comprehends three districts, the inhabitants of which are distinguished by physical characteristics. The inhabitants of the Bocage, the western district, are marked by a lower stature than their neighbours, a pale complexion, lively glance, willingness to labour, strong attachment to their native soil, and tenacious adherence to ancient customs: the women are slender but strong and fruitful; they share in the labours of the field. The inhabitants of the plain of Caen are taller, well proportioned, and of fresh complexion, more susceptible of change in their manners, and more influenced by fashion. The people of Le Pays d'Auge, the eastern district, are slow in their movements, and not equal to their neighbours in intelligence.

CALVARY. [JERUSALEM.]

CALVERT, GEORGE. [BALTIMORE, LORD.]

CALVIN, JOHN, was born on the 10th July, 1509, at Noyon, in Picardy, where his father, Gerard Cauvin, was by trade a cooper. His parents being of respectable character, but in humble circumstances, young Calvin, who had early shown a pious disposition, was taken under the protection of a family of wealth in the place, and sent by them to the university of Paris to study for the church. At the age of twelve he obtained from the bishop a benefice in the cathedral of Noyon, to which, in about five years afterwards, was added the cure of Monteville; but this he exchanged, two years after, for the cure of Pont l'Évêque. All this time he was pursuing his studies, and had not even received priest's orders. His father now changed his mind as to the destination of his son, and desired him to turn his attention to the law, as the sure road to wealth and honour. This change was not unacceptable to Calvin, who, from his perusal of the Scriptures—a copy of which was furnished him by Robert Olavetay, who was a fellow scholar, and likewise a native of Noyon—had already been convinced of many of the errors of the Romish church. He accordingly left Paris, and repaired, first to Orléans, where he studied under Peter Stella, and then to Bruges, where Andrew Aloiat filled the chair of law; and where also, which was

more important to Calvin's future character, Milchior Wolmar, the reformer, taught him the Greek tongue. Here Calvin was convinced in the doctrines of the reformation, and began indeed to preach them in the villages. His father, however, dying at this time, he returned to Noyon, but after a short period went to Paris, where, in the year 1532, he published his *Commentaries on Seneca's* two books, 'De Clementia.' He now also resigned his benefices, and devoted himself to divinity. The following year, Cop, the rector of the university of Paris, having occasion to read a public discourse on the festival of All Saints' Day, Calvin persuaded him to declare his opinion on the new doctrines. This brought upon them both the indignation of the Sorbonne and parliament, and they were forced to leave the city. Calvin went to several places, and at length to Angoulême, where he got shelter in the house of Louis Du Tallet, a canon of Angoulême, and supported himself some time there by teaching Greek. It was here he composed the greater part of his 'Institutes of the Christian Religion,' which were published about two years afterwards. The queen of Navarre, sister to Francis I., having shown him some countenance in respect of his learning and abilities, and no doubt also of his sufferings, he returned to Paris, in the year 1534, under her protection, but persecution being again threatened, he quitted France the same year, having first published a work, which he called 'Psychopannychia,' to confute the error of those who held that the soul remained in a state of sleep between death and the resurrection, and retired to Basil in Switzerland, where he published the 'Institutes,' which he dedicated to Francis I., in an elegant Latin epistle. The design of the Institutes was to exhibit a full view of the doctrines of the reformers; and as no similar work had appeared since the Reformation, and the peculiarities of the Romish church were attacked in it with great force and vigour, it immediately became highly popular. It soon went through several editions: it was translated by Calvin himself into French, and has since been translated into all the principal modern languages. Its effect upon the Christian world has been so remarkable, as to entitle it to be looked upon as one of those books that have changed the face of society. After the publication of this great work, Calvin went to Italy to visit the reformers there, and was received with marked distinction by the learned duchess of Ferrara, daughter of Louis XII. But notwithstanding her protection, the Inquisition opened upon him, and he was obliged to seek safety in flight. He returned to France, but soon left it again, and in the month of August, 1536, came to Geneva, where the reformed religion had been the same year publicly established. Here, at the urgent request of Farel, Viret, and other eminent reformers, by whom that revolution had been achieved, he became a preacher of the Gospel, and professor, or rather lecturer on divinity. Farel was at this time the most distinguished person in the place: he was twenty years older than Calvin, who was in the twenty-seventh year of his age; but their objects were the same, and their learning, virtue, and zeal alike, and these were now combined for the complete reformation of Geneva, and the diffusion of its principles throughout Europe. In the month of November, a plan of church government and a confession of faith were laid before the public authorities for their approval. Beza makes Calvin the author of these productions; but others, with perhaps greater reason, attribute them to Farel. There is little doubt, however, that Calvin was consulted in their composition, and still less that he lent his powerful aid to secure their sanction and approval by the people in the month of July, 1537. The same year the Council of Geneva conferred on Farel the honour of a burghess of the city, in token of their respect and gratitude. But the popular will was not prepared for the severe discipline of the reformers, and in a short time the people resisted some innovations on their religious practices, and, under the direction of a faction, met in a public assembly and expelled Farel and Calvin from the place. Calvin repaired to Berne, and then to Strasburg, where he was appointed professor of divinity and minister of a French church, into which he introduced his own form of church government and discipline. In his absence, great efforts were made to get the Genevese to return to the communion of the church of Rome, particularly by Cardinal Sadolet, who wrote to them earnestly to that effect; but Calvin, ever alive to the maintenance of the principles of the Reformation, disappointed all the expectations of his enemies, and confirmed the Genevese in the new faith, addressing to

them two powerful and affectionate letters, and replying to that written by Sadoleto. While at Strasburg also, Calvin published a treatise on the Lord's Supper, in which he combated the opinions both of the Roman Catholics and Lutherans, and at the same time explained his own views of that ordinance. Here, too, he published his 'Commentary on the Epistle to the Romans.' Calvin got acquainted with Castalio during his residence at Strasburg, and procured for him the situation of a regent at Geneva; and it was during his stay in this city that, by the advice of his friend Bucer, he married Idollet, the widow of an Anabaptist preacher just deceased.

In November of the same year, he and Farel were solicited by the Council of Geneva to return to their former charge in that city: in May, 1541, their banishment was revoked; and in September following Calvin was received into the city amidst the congratulations of his flock, Farel remaining at Neuchâtel, where he was loved and respected. Calvin did not trifle in the peculiarly favourable circumstances in which he was now placed. He immediately laid before the Council his scheme of church government, and after it was adopted and published by authority, which was on the 20th November, 1541, he was unhesitating in its enforcement. His amplitude and firmness were now conspicuous: he was the ruling spirit in Geneva: and the church which he had established there he wished to make the mother and seminary of all the reformed churches. His personal labours were increasing: he preached every day for two weeks of each month: he gave three lessons in divinity every week; he assisted at all the deliberations of the consistory and company of pastors; he defended the principles of the reformation against all who attacked them; he explained those principles both in writing and discourse; and maintained a correspondence with every part of Europe. Geneva, however, was the common centre of all his exertions, and its prosperity peculiarly interested him, though less for its own sake than to make it a fountain for the supply of the world: he established an academy there, the high character of which was long maintained; he made the city a literary mart, and encouraged all the French refugees and others who sought his advice to apply themselves to the occupation of a printer or librarian; and having finished the ecclesiastical regimen, he directed his attention to the improvement of the municipal government of the place. That Calvin should, in the circumstances in which he was now placed, show marks of intolerance towards others, is not surprising: and to seek a palliation of his guilt we need not go back to the time when he belonged to the Church of Rome, nor yet to the notions of civil and religious liberty prevalent in his age. We have only to reflect on the constitution of the human mind, and the constant care necessary to prevent power in any hands from degenerating into tyranny. His conduct towards Servetus [SERVETUS] has been justly condemned, and has drawn down upon him the epithet of 'a most cruel and atrocious monster': yet the punishment of Servetus was approved of by men of undoubted worth, and even by the mild Melancthon. In 1554, the year following Servetus's death, Calvin published a work in defence of the doctrine of the Trinity against the errors of Servetus, and to prove the right of the civil magistrate to punish heresy; Beza the same year published a work on the like subject, in reply to the treatise of Castalio. Of all the testimonies to the merits of Calvin at this time, the most unsuspected is that of the canons of Noyon, who, in 1556, publicly returned thanks to God on occasion of his recovery from an illness which it was thought would prove mortal. It was no doubt the state of Calvin's health which prevented him going in 1561 to the famous Conference of Poissy: nothing but his many pains and infirmities, as it appears from his correspondence with Beza, who was sent to the conference from Geneva, would have prevented him attending an assembly which promised to be of so much consequence, and which was indeed remarkable in this respect, that from that time the followers of Calvin became known as a distinct sect, bearing the name of their leader. Amidst all his sufferings, however, neither his public functions, nor his literary labours ceased: he continued to edify the church of Geneva by his sermons and his intercourse among the people, and to instruct Europe by his works; and to the last he maintained the same firmness of character which had distinguished him through life. On his death-bed he took God to witness that he had preached the gospel purely, and exhorted all about him to walk worthy of the divine goodness: his deli-

cate frame gradually became weaker and weaker, and on the 27th May, 1564, he died without a struggle, in the fifty-fifth year of his age. The person of Calvin was middle-sized and naturally delicate; his habits were frugal and abstemious; and he was so sparing in his food, that for

any years he had only one meal in the day. He had a clear understanding, an incredible memory, and a firmness and inflexibility of purpose which no opposition could overcome, no variety of objects defeat, no vicissitude shake. In his principles he was devout and sincere, and the purity of his character in private life was without a stain. His writings are very numerous; but, except his 'Christian Institutes,' his commentaries on the Bible, and a few others, they have long been covered with undisturbed dust, though in their day none of his works were without their influence. There have been various collections of his works. In 1552 all his minor pieces or 'Opuscula' were collected and published at Geneva. In 1576 a similar collection was made of his theological tracts; and the same year Beza published a collection of his letters, with a life of Calvin. We find also in Senebier (*Hist. Litt. de Genève*, tome i.) not only a list of all Calvin's publications, but a catalogue of sermons preached by him which yet remain in MS. in the public library of Geneva.

CALVINISM, the system of religious doctrine and church government maintained by Calvin and his followers. Calvin, as we have seen, published his system in his 'Christian Institutes' in the year 1536; but it does not appear to have obtained the name of Calvinism, nor its supporters the name of Calvinists, till the conference of Poissy in 1561. The reformer was not himself present at that assembly, being prevented from attending by his local duties and the ill state of his health; but we see from his correspondence with Beza, the deputy from Geneva, how deep was his interest in its proceedings, and that nothing was done on the part of the reformers without his knowledge and advice. In the debate which took place on the Augsburg Confession, the points of difference between the Lutherans and Calvinists were drawn out; and they were such as that from thenceforth the latter became known as a distinct sect under that denomination.

The tenets of Calvinism respect the doctrines of the Trinity, predestination, or particular election and reprobation, original sin, particular redemption, effectual or irresistible grace in regeneration, justification by faith, and the perseverance of saints; together also with the government and discipline of the church, the nature of the eucharist, and the qualification of those entitled to partake of it. The great leading principles of the system however are the absolute decrees of God, the spiritual presence of Christ in the eucharist, and the independence of the church.

Calvinism was, perhaps, like Lutheranism, exemplified first at Strasburg; where, in the year 1538, Calvin established a French church on his own plan. But it was at Geneva the system was seen in all its vigour; and from thence it spread into France, Germany, Prussia, the United Provinces, England and Scotland. To this last place it was carried by Knox, the disciple and intimate correspondent of Calvin; and as within the little territory of Geneva there was neither room nor need for the parochial sessions, presbyteries, provincial synods and general assembly, to which the presbyterial government expands itself in a large community, we shall briefly advert to its leading features in Scotland as it appeared there in the lifetime of Knox. We shall thus indeed see the church of Scotland in its infancy; but at the same time, and it is that we have chiefly in view,—we shall thus perhaps have the best idea of the matured opinions of the great reformer.

The Confession of Faith, ratified by the Scots Parliament in 1560, declares* that by the sin of our first parents, 'commonly called original sin, the image of God was utterly defaced in man, and he and his posterity of nature became enemies of God, slaves to Satan, and servants unto sin; in so much that death everlasting has had, and shall have, power and dominion over all that have not been, are not, or shall not be, regenerated from above, which regeneration is wrought by the power of the Holy Ghost, working in the hearts of the elect of God an assured faith in the promise of God revealed in his word; that from the eternal and immutable decree of God all our salvation springs and depends: God of mere grace electing us in Christ Jesus his son before the foundation of the world was laid; and that

* We have here modernized the spelling.

'our faith and assurance, the same proceeds not from flesh and blood, that is to say, from our natural powers within us, but from the inspiration of the Holy Ghost; 'who sanctifies us, brings us in all verity by his own operations, without whom we should remain for ever enemies to God, ignorant of his son Christ Jesus; for of nature we are so dead, so blind, and so perverse, that neither can we feel when we are pricked, see the light when it shines, nor assent to the will of God when it is revealed, unless the spirit of the Lord Jesus quicken that which is dead, remove the darkness from our minds, and bow our stubborn hearts to the obedience of his blessed will; 'so that the cause of good works we confess to be not our free will, but the spirit of the Lord Jesus, who dwelling in our hearts by true faith, brings forth such works as God has prepared for us to walk in; and 'whoso boast themselves of the merits of their own works, or 'put their trust in works of supererogation, boast themselves in that which is not, and put their trust in damnable idolatry.' It further admits that 'we now, in the time of the evangel, have two chief sacraments only,' to wit, Baptism and the Lord's Supper; by the former of which 'we are ingrafted in Christ Jesus to be made partakers of his justice, by which our sins are covered and remitted; and in the latter it is asserted there is a real though only spiritual presence of Christ, and 'in the supper rightly used, Christ Jesus is joined with us, that he becomes very nourishment and food of our souls.' The marks of a true church are said to be the true preaching of the word of God, the right administration of the sacraments, and ecclesiastical discipline rightly administered as the word of God prescribes. The polity or constitution of the church however is not detailed; this was done in the 'Book of discipline' drawn up by Knox and his brethren. The highest church judicatory is the General Assembly, composed of representatives from the others, which are provincial synods, presbyteries, and kirk sessions. The officers of the church are pastors or ministers, doctors or teachers, and lay elders, to which are to be added lay deacons, for the care of the poor. Among the clergy there is a perfect parity of jurisdiction and authority, and in the church courts clergy and laity have equal voices. The minister and the elder indeed are both *presbyters*—the one a preaching presbyter, and the other a ruling presbyter; and it will be remembered that when Bucer expressed his approbation of the episcopal hierarchy of England, Calvin said it was only another papacy. Another principle, recognised alike by Calvin and the reformers of Scotland, was the education of the people: which both seem to have regarded as the rock upon which the reformed church should be built; and in Scotland, as was fit, this foundation was as broad as the building, it being meant that, besides the universities of the kingdom, there should be in every district a parish church and a parish school.

CALW, or **CALBE**, a bailiwick in the Württemberg circle of the Black Forest, about 115 square miles in area, with a population of about 21,300; and containing 3 towns and 32 villages and hamlets. It produces much timber, flax, linen, &c., and has many spinners, and manufactories of woollens and leather. In a mineralogical point of view it is extremely interesting. The town of Calw is the chief place in the bailiwick, and is situated on the Nagold, in a narrow valley of the Black Forest, on the acclivity of which part of the town is built. The town is of very ancient date, and was an important part of the 14th century the capital of the Margravdom of Calw. The river divides it into the Upper and Lower towns, which contain 7 churches, about 500 houses, and 4300 inhabitants. It has long been the seat of considerable trade, and has 5 commercial associations, a large manufactory of woollens and ker-seymers, 2 factories for spinning woollen yarn, 3 dyeing works, and manufactories of stockings, leather, lime, &c. It was the birthplace of Pope Victor II., one of the counts of Calw, and of Wallace, the surgeon who saved the life of Augustus king of Poland, at Bialystock, in 1727. 48° 42' N. lat., 8° 44' E. long.

CALX. [CALCINATION.]

CALYCANTHACEÆ, a natural order of hardly dicotyledonous plants, well known in gardens for the delicious fragrance of their blossoms. They are in some respects allied to the magnolia, or star-anise plant (*Illicium*), in consequence of their chocolate-coloured flowers with the segments overlying each other in several rows, and because also of their peculiar fragrance; their true affinity is however with

Rosaceæ, as the mass of their characters sufficiently proves; especially the unusual circumstance of the cotyledons of the embryo being rolled up both in this order and in the genus *Chamaemeles* in **Rosaceæ**. (Lindley's *Natural System of Botany*, ed. 2, p. 159.)

Calycanthaceæ consist of but two genera, *Calycanthus* and *Chimonanthus*, which agree in having, 1st, an imbricated calyx and corolla that pass insensibly into each other, and combine their bases into a thick fleshy tube; 2nd, a small number of perigynous stamens, whose anthers are adnate and are tipped by a projection of the connective; 3rd, several one-seeded nuts enclosed in the tube of the calyx; and 4th, a convolute embryo, destitute of albumen. Their wood is remarkable for the glandular nature of the woody tubes; and for having, in addition to the usual stricture of exogens, four imperfect axes with concentric circles, lying at equal distances in the bark near the circumference, on which they produce externally four elevated lines or wheels. The nature of these additional axes constitutes a problem which no one has yet been able to solve.

The two genera are thus distinguished:—*Calycanthus*, or the Carolina allspice, has 48 stamens arranged in four rows, the innermost being rudimentary; and a great many nuts enclosed in a calyx, which is naked at its apex. Botanists of small shrubs, natives of North America, with fragrant chocolate-coloured flowers, appearing along with the leaves in May or June.

Chimonanthus, or the Japan allspice, has ten stamens, all perfect and inserted in a double row; only one or two nuts to each calyx-tube, which is crowned and closed up by the permanent recurved stamens. The only species is found wild in Japan, and has fragrant, lemon-coloured blossoms, appearing in the winter after the fall of the leaves. Botanists call it *Chimonanthus fragrans*, and distinguish three varieties: 1st, the pale kind, which has long been in gardens, and has flowers the colour of which is very slightly yellow; 2nd, the large-flowered, with bright yellow flowers twice as large as those of the last; and 3rd, the small-flowered, which is in all respects the same as the first, except that its blossoms are less than half the size. These plants are multiplied with some difficulty by layering.

CALYCERACEÆ, a small natural order of Monopetalous Dicotyledons, differing from *Compositæ* in nothing but their seeds having albumen, and being pendulous, and in their anthers being only half syngenesious. (Lindley's *Natural System of Botany*, p. 251, ed. 2.)

CALYCIFLORÆ, an artificial division of polypetalous dicotyledonous plants, proposed by Jussieu and adopted by Professor De Candolle. It is characterized by the stamens adhering more or less to the side of the calyx; or, in the language of the French school of botanists, being perigynous.

CALYMENE. [TRILOBITES.]

CALYMMA (Zoology), a genus of *Ciliograda*, thus characterized by Eschscholtz:—Body but little elevated, compressed, widened as it were, and provided on each side with a considerable appendage, taking its rise from four other smaller appendages, free at their extremity, near the mouth, and furnished with the series of cilia. The species on which the genus was established was taken in the South Seas near the equator.

CALYPSO (zoology). [**GALATHEA**.]

CALYPTOMENE. [PIPRADÆ.]

CALYPTORHYNCHUS. [PITTACIDÆ.]

CALYPTRA, in botany, a name given to a hood-like body connected in some plants with the organs of fructification. In the genus *Pilea* it covers over the flower, and is formed of united bracts; in *Eucalyptus* and *Eudemia* it is simply a lid or operculum to the stamens, and is produced in the former by the consolidated sepals, in the latter by the petals in the same state: in mosses it is seated upon the end of the fruit-stalk, enclosing the spore-vessel, and is a leaf rolled round the latter and torn away from its base: in *Jungermannia* it exists in the form of a cup or wrapper at the base of the fruit-stalk, which, instead of carrying it up upon its point, pierces through its apex and leaves it behind.

CALYPTERIDÆ, a family of gasteropodous mollusks, formerly arranged under the genus *Patella* of Linnaeus, and known by collectors as *chambered limpets*, comprising the genera *Calyptrea* and *Crepidula* of Lamarck, with the subgenera into which they have been divided by Lesson.

When, says M. Deshayes in his edition of Lamarck.

'collections' contained but a small number of Calyptrææ and Crepidulæ, and when the animals of these two genera were unknown, it was natural and proper to preserve them both; but now the resemblance of the animals of these two genera is proved, not only by what M. Cuvier formerly stated in the "Annales du Muséum," but also by the more recent works of M. Lesson, of MM. Quoy and Gaimard, and of Mr. Owen. Already we had perceived in publishing our work upon the environs of Paris, as well as in our articles "Calyptrææ" and "Crepidula" in the Encyclopédie, that there existed a great resemblance between the shells of these two genera. One sees in effect, in certain Crepidulæ, the summit taking a spiral shape upon the side of the shell, and raising itself insensibly in a succession of species, so as to show an incontestable passage between the Crepidulæ and spiral Calyptrææ, which we would particularly designate by the name of trochiform Calyptrææ. As in the Calyptrææ, properly so called, there exists a certain number of particular forms which may serve to group them in sections, it was necessary to see whether the species, having in their interior a lamina or plate of a funnel shape, afforded proof of a passage to the Crepidula, like those which are trochiform. This passage does exist, so that from the entire facts we may come to the conclusion that the two genera, Calyptrææ and Crepidula, ought to be united for the future in the system. This conclusion, which we had in some sort foreseen, has been rigorously drawn and proved by incontestable evidence in the work* lately published by Mr. Broderip, in the first volume of the Transactions of the Zoological Society of London. M. Lesson, in the conchological part of the great work published on the return of the expedition in the corvette *La Coquille*, had attempted to establish in the united genera Calyptrææ and Crepidula many subgenera, of which some have been adopted by Mr. Broderip, as sections of the entire genus Calyptrææ. These sections, of which some persons think that they can make genera, are connected one with another by the strongest affinities, and cannot be separated into genera on account of the resemblance of the animals.

Deshayes then proposes the following sections of the great genus *Calyptrææ*:—

1. Those which have in their interior, and fixed to the summit, a shelly plate, hollowed out into a sort of gutter, which may be compared to a hollow cone of paper cut longitudinally in two, and of which one portion has been removed. (*Calyptrææ equestris*)

2. Those which have a delicate plate or lamella in the form of a funnel, fixed either to the side or to the summit. A well-defined section, presenting nevertheless a passage towards some of the Crepidulæ.

3. Uniting all the species from those which begin to have a very short lamella attached to the internal side (*Calyptrææ extinctorum*), to those whose lamella forms spiral turns (*Calyptrææ trochiformis*), the gradations being very insensible. To this section M. Deshayes thinks that many of Lamarck's Crepidulæ should be referred.

4. Crepidula properly so called. This section he says might be subdivided, taking for a basis of the subdivision characters of less value than those relied on for forming the four principal sections.

Our limits will not permit us to illustrate the several gradations of form by representations of the different species; and they are so numerous, and glide so imperceptibly into each other, that to give a few marked distinctions would be calculated to mislead. Some idea of the variety of shape to which the shells are subject may be obtained from the following passage in Mr. Broderip's paper:—"I have before me specimens taken from under the same stone, evidently of the same species, varying in shape from a regular high cone to an almost flat surface, with nearly every intervening irregularity of circumference that can be imagined." We must therefore refer the reader to the three plates illustrative of Mr. Broderip's paper for numerous examples of the forms of the shells, and to those of M. Cuvier, M. Deshayes, and Mr. Owen, for the anatomy of the animal. For the method of arrangement proposed by M. Lesson, his Memoir in the second volume of the *Zoologie de la Coquille* may be consulted; but the student is desired to bear in mind that, in the figure of *Calyptrææ (Crepidatella) Adolphæi* (*Zoologie de la Coquille*, Atlas, Mollusques,

pl. 15, fig. 2, a.), the position of the head of the animal is wrong, as Mr. Broderip has pointed out, its real situation being nearly opposite to the point which it occupies in M. Lesson's plate.

Geographical distribution.—The species are numerous and widely diffused; but the great development of the form is to be found in warm climates, where many of the species attain considerable size, and are remarkable for their form and the richness of their colour. They are found sticking on rocks, on and under stones, on other living and dead shells, and submarine substances, at depths varying from the surface to forty fathoms, on sea-coasts, in estuaries, and in tidal rivers.

Fossil Calyptræidæ.—Some of these are both living and fossil, others fossil only, and are given in Deshayes's tables, which apply to the tertiary beds only, as occurring in the Pliocene, Miocene, and Eocene periods of Lyell, respectively.

CALYX, the external wrapper of a flower within the bracts. Usually it is green and leaf-like, sometimes however it is coloured like a corolla, from which it is only known by its being the outermost of the rows of floral envelopes. It consists of leaves called sepals, which are sometimes separate when the calyx is polysepalous, and sometimes united into a sort of cup by the edges, or monosepalous. Occasionally it is converted into feathery or short divisions, when it is named pappus; or it is altogether reduced to a small rim, so as to be hardly visible. In some plants it grows to the sides of the ovary, and is technically called *superior*, while it is named *inferior* if it is quite separate from that part. Its segments are usually of the same number as those of the corolla, and alternate with them. The office of the calyx appears to be, in its ordinary green state, merely that of protecting the tender parts that are formed within it; but when it is coloured and similar to a corolla, we can scarcely doubt that in such cases it also performs the part of a corolla. [**COROLLA.**] In some instances, as in that of pappus, it seems merely intended as a means of transporting seeds to a distance by enabling them to catch the wind by the wings which it at that time assumes.

CAMALDOLENSES, CAMALDOLITES, a religious order founded by St. Romualdo, at the beginning of the eleventh century. The order was a reform of that of the Benedictines, whose constitutions St. Romualdo retained, with some modifications of additional strictness, one of which is the silence enjoined to members of the community. The dress of the Camaldolites is white, and they wear their beards long. The first establishment of the order was in the high Apennines, above the Casentino, or valley of the Upper Arno, E. of Florence, from the summit of which, on a clear day, both the Adriatic and the Mediterranean are visible. A proprietor called Maldulo gave to St. Romualdo, in 1009, a piece of ground in these mountains, where the first cells of the monks were built; hence the name of Campus Maldoli, and by corruption Camaldoli. The cells, with their respective gardens, are now abandoned, but the church remains, though stripped of its ornaments. The spot is called the Eremo or Hermitage; but the monks live in a large convent a mile lower down, at a place called Fontebuona, where they have another church, in which are some good paintings by Vasari. A good library, with valuable MSS., and the old archives of the convent, and a collection of paintings, were dispersed at the time of the suppression of the convent by the French, in 1810. The monks are possessed of part of the neighbouring forest, which abounds in large fir-trees, and they have always been remarked for their economical and intelligent management of this kind of property. During the few years of the suppression of the convent, the forest has much deteriorated, the trees having been cut down injudiciously, and without being replaced by fresh plantations. (Repetti, *Dizionario Geografico Fisico della Toscana*, 1834.) The order of Camaldolites is possessed of convents in various parts of Italy, mostly built in secluded and elevated situations. There is one near Naples, on a mountain above the lake of Agnano, well known for the splendid view which it commands, and another at Monte Corona in the Apennines, near Perugia. The order of Camaldolites has produced many learned men; among others Fra Mauro, a geographer of the fifteenth century, Father Traversari, a theologian, besides the historians of the order. The present Pope, Gregory XVI., belongs to the order. They had a printing-press attached to their convent in the Tuscan Apennines.

* Descriptions of some new species of Calyptræidæ. By W. J. Broderip, Esq., Vice-President of the Geological and Zoological Societies, F.R.S., L.S., &c., vol. 1, p. 185.

† In the *Annales des Sciences Naturelles*.

CAMARGUE or **CARMAGUE**, Isle of. [BOUCHES DU RHÔNE, DEPARTMENT OF.]

CAMARINA (*Kapaywa*), a town in the S. of Sicily, on the river Hipparis, very near the sea. Camarina was a Dorian town (Thucyd. iii. 86), the most considerable of the Syracusan colonies (Strab. vi., p. 272, a, Casaub.), founded B.C. 600 (Clinton, F. H., vol. i., p. 226, 2nd edit.), 136 years after the foundation of Syracuse from Corinth (Thucyd. vi. 3.). The situation was unhealthy, owing to the neighbourhood of a marsh which was formed by the river Hipparis; this marsh however was so great a safeguard against the attacks of enemies, that it was considered that the draining of it would be fatal to Camarina. Hence the proverb *in rivu Kapaywa (ne moveas Camarinam)*; which implied that, although the marsh was an evil, the danger which would attend its removal would be a greater one. Only a few ruins now remain, bearing the antique name. Few towns have undergone so many and remarkable revolutions as Camarina. Some time after its foundation (Thucydides does not say how long) it revolted from the mother state, and the town was destroyed (Thucyd. vi. 5.). The Syracusans were afterwards forced to cede Camarina to Hippocrates, tyrant of Gela, who however colonised it afresh (Thucyd. vi. 5.). Gelon, the successor of Hippocrates, destroyed the town again (Herod. vii. 156), and removed the inhabitants to Syracuse. He appears to have subsequently rebuilt it (Raoul-Rochette, *Colon. Grecy.* iii. p. 358). The inhabitants were again driven out by Dionysius the elder, B.C. 394, and moved to Leontium. The town was afterwards restored and enriched by Timoleon (Diodor. Sicul. xvi. 83), B.C. 336. In the year 404 B.C., it was again stormed and taken by the Carthaginians. (Diodor. Sicul. xxiii. p. 320. Bipont edit.)

Coin of Camarina.

[Brit. Mus. Actual size. Silver. 266 grains.]

CAMAROONS or **CAMAROENS**, a river of Africa, which discharges itself into the Bight of Biafra and into the same estuary as the Malimba, about 45 miles to the E. of Fernando Po. It has a bar across its mouth, with an average depth of from 15 to 18 feet water over it. Of this river little is known beyond a few miles from the entrance. Like the other rivers on this coast, it is a great mart for slaves. Palm oil and ivory are also obtained here; the latter is considered very fine.

The system of traffic is by barter, and the articles in demand the same as the Calabar. This river is separated from those to the westward by high land called the Camaroon mountains, the highest peak of which rises to 13,000 feet above the sea, and is generally capped with snow. The name is derived from the Portuguese word for shrimp, of which there is a great abundance. Each side of the river is governed by a separate chief, whose friendship must be purchased by presents before any traffic is commenced.

CAMBACÈRES, **JEAN JACQUES DE**, was born at Montpellier in 1753. His father was an advocate, and brought him up to the same profession, in which he soon distinguished himself, and was made Counsellor of the Cour des Comptes of Montpellier. When the revolution broke out he was elected deputy to the Legislative Assembly, and afterwards to the Convention, where he voted for the death of Louis XVI., but with a conditional reprieve. In the subsequent period of terror he endeavoured to act cautiously, to bring back the Assembly to legal measures, and to check arbitrary acts. He afterwards sat in the Council of Five Hundred, and was made Minister of Justice under the Directory, in which capacity he greatly assisted Bonaparte in the revolution of the 18th Brumaire. From that moment he followed the fortunes of Napoleon, and was among his most useful and subsequent instruments: he was also one of the few who remained faithful to him to the last. In his capacity of Great Chancellor of the empire, he had to communicate to the senate

all Napoleon's measures for peace or war, including his frequent demands for fresh conscriptions of men, which were sanctioned by that docile assembly. Cambacères was one of the compilers of the civil code, for which his legal knowledge rendered him very well qualified. He had already written, in 1796, a *Projet de Code Civil*, which became in a great measure the basis of the new code. After Napoleon's first abdication in 1814, Cambacères lived in retirement at Paris. When Napoleon returned from Elba, he appointed Cambacères Minister of Justice, notwithstanding his excuses. After the king's second return, Cambacères withdrew again to private life, and in February, 1816, he went to reside at Brussels, being included in the list of those who were exiled from France for having voted for the death of Louis XVI. However, in May, 1818, the king reinstated Cambacères in all his civil and political rights, in consequence of which he returned to Paris, where he died in 1824. His manners were courteous and pleasing; he was liberal and hospitable, and had the reputation of giving the best dinners of any of the ministers and great officers of the empire.

CAMBAY, **GULF OF**, formerly known as the gulf of Barogaza, is situated on the N.W. coast of India, and extends from the southern extremity of the peninsula of Gujerat in 20° 40' N. lat. and 71° 7' E. long. to the city of Cambay, a distance of 130 miles. In consequence of the currents and the bore which occur in this gulf, its navigation is dangerous. [BAROACH.] The waters of the Sauberinutty, the Mhye of Mahy, the Dhandur, the Nerbudda and the Tuptee rivers discharge themselves into this gulf.

CAMBAY, a large city, supposed to be the *Camana* of Ptolemy, situated at the mouth of the Mhye river and at the head of the Gulf of Cambay, in 22° 21' N. lat. and 72° 48' E. long. When Gujerat was an independent state, Cambay, as the sea-port of its capital Ahmedabad, enjoyed a high degree of commercial prosperity, which it has since lost. The city contains several mosques and Hindoo temples, and the remains of many more religious edifices, the greater part of which appear to have belonged to the sect of Jains, whose religion was formerly predominant in this part of India.

The trade of Cambay formerly embraced the export of silk and chintz goods, jewellery, and indigo, but at present nearly all its export trade consists of grain sent to Bombay. The surrounding country is fertile, and furnishes an abundance of wheat, oil, seeds, and the other grains usually raised in this part of India. The silversmiths of Cambay still retain their superiority in the art of embossing.

Until the beginning of the present century the city and territory of Cambay were governed by a native prince who was tributary to the Maharattas, but on the overthrow of the Peshwa the British succeeded to his rights, and the prince now pays tribute to the East India Company's government. (Vincent's *Periplus*; Rennell's *Memoir of a Map of Hindustan*; Mill's *History of British India*.)

CAMBING OUTANG. [ANTELOPE, Species 27.]

CAMBIUM, a viscid substance that appears in the spring between the wood and bark of exogenous trees. It is supposed to be intended, firstly, to lubricate the faces of the wood and bark, so as to enable the new woody matter of the branches to descend the more freely; and secondly, as a means of nourishing and consolidating the young tissue of which the horizontal and vertical systems of a tree equally consist. This substance disappears every spring after the complete formation of the wood, which then adheres firmly to the bark; but it re-appears whenever the plant is again called into growth, as at midsummer in those species which shoot twice a-year, like roses, peaches, &c.

CAMBO'DIA, or rather **CAMBODJA**, by the natives called Kan-phutchi, is a very extensive country in the peninsula without the Ganges. It comprehends all the countries on both sides of the river Maekhaun, or Cambodia river, from its mouth as far as 15° N. lat. It seems to have existed for a great length of time as an independent empire, whose princes from time to time sent presents and sometimes tribute to the Chinese court. But discussions in the reigning families, and contests about the succession to the throne, by degrees reduced its power and weakened its stability. In an unsuccessful war with the Siamese, Cambodia was obliged to call to its aid the Cochin Chinese, and at its termination it became tributary to the latter. The revolutions which occurred in Cochin China towards the end of the last century restored Cambodia to its independence; but new quarrels soon arose, which placed the coun-

try, in 1786, under the dominion of Siam. One of the pretenders to the throne having applied in 1809 to the Cochinchinese for help, they entered the country with a considerable army, and met the Siamese; but before they came to a battle they agreed to divide the country between them. The Siamese retained the province of Batabang, which is contiguous to their other territories; and the remainder was united to the kingdom of Cochinchina or Anam. (Crawford's *Journal*, &c.)

CAMBOGE. Though this gum-resin was introduced into Europe by Clusius about 1603, the tree which yields it is not accurately ascertained. All writers agree in referring it to the tribe of the Guttiferae, and the latest authorities point to *Stalagmites Cambogioides* (Murray), which according to Wight and Arnott is a species of *Garcinia* (probably synonymous with *Garcinia cochinchensis* (Chen.), the *Ocycarpus cochinchensis* of Louriero), as the source of the Siam camboge; while that of Ceylon is stated to be obtained from the *Xanthochymus ovalifolius*. (Roxb.) Others assign the Ceylon camboge to the *Mangostana Morella*. (Deros. in *Lamarck's Encyclo.* vol. iii. p. 701.) This last point it is of less importance to settle, if the statement of Dr. Christison be correct, that Ceylon camboge is not now an article of European commerce, all which is found in the markets of this country coming from China.

From the bruised leaves and young branches of the first-mentioned tree flows a yellow juice, which is received in cocoa-nut shells or earthen vessels; it is then allowed to thicken, and afterwards formed into rolls. This is the finest sort, called the pipe camboge of Siam. A portion is formed into round cakes, which are either entire or have a hole in the centre. This is the cake camboge of Siam.

The juice from the *Xanthochymus ovalifolius* flows spontaneously, but sparingly; it is increased by incisions in the stem, and by kindling fires in the vicinity of the tree. The colour of both kinds differs according to the season of the year, the age, and part of the tree from which the juice is obtained. The Siam camboge occurs in pieces of variable size, externally of a dirty yellowish brown colour, covered with a fine yellow powder. When broken they exhibit a conchoidal or vitreous fracture, with a brown or saffron-yellow colour.

At the ordinary temperature of the air camboge has little smell, but when heated gives out a very peculiar one. Taken into the mouth it has scarcely any perceptible taste, but upon being chewed for some time it causes a sharp, somewhat acrid feeling, ending in a sweet sensation, accompanied with dryness in the mouth. It excites afterwards a flow of saliva, which is coloured yellow. Its specific gravity is 1.207. A specimen of pipe camboge of Siam, analysed by Dr. Christison, yielded as follows:—

Pipe Camboge of Siam.	Cake Camboge of Siam.
Resin 72.3	Resin 64.8
Arabin 23.0	Arabin 20.2
Moisture 4.8	Fecula 5.6
	Lignin 5.3
	Moisture 4.1

Of Ceylon camboge, one specimen yielded—

Resin	75.5
Arabin	18.3
Cerasin	0.7
Moisture	4.8

The cake camboge is not entirely a natural production, but a manufactured article.

Camboge is almost entirely soluble in alcohol, and is not precipitated from solution by the addition of water. With water it forms an emulsion, in which the resin is kept suspended by the gum. It is soluble in the alkalies. The resin may be considered its active principle. It is remarkable that a substance possessed of such slight sensible qualities, having no smell, and scarcely any taste, should be so powerful in its action on the human frame. It is a drastic purgative; and, in combination with alkalies, forms a most powerful hydrogogue cathartic, occasioning numerous copious watery motions. In an overdose it causes excessive purging, sometimes vomiting, and if taken in large quantity, it produces inflammation of the intestines, mortification, and death.

The diseases in which it is most useful are ascites, or dropsical accumulations in the cavity of the abdomen, especially if accompanied with obstructions in the liver, or other abdominal viscera. It has also been employed against the tape-

worm, and obstinate or habitual constipation. The doses must be carefully regulated, and only taken by the order of an intelligent and responsible medical attendant. Its use as a quick medicine has led in many cases to fatal results.

Yellow juices, which when inspissated form a substance resembling camboge, are obtained from several trees, both of the tribe of Guttiferae and Hypericaceae. *Garcinia*, for example, is stated by Mr. Royle (*Flora of the Himalaya*, p. 132) to yield a camboge, which in its crude and unprepared state is superior to every other kind; but it is not so prepared. The *Garcinia celebica* (Linn.) likewise furnishes. Several species of *Vismia* (Hypericaceae) yield a camboge of good quality;—*V. sessilifolia* (Pers.), *V. neriifolia* (Pers.), *V. cayennensis* (Pers.), *V. micrantha* (Pers.), *Vismia baccifera* (Mart.). The *Hypericum mexicanum* (Roxb.) also yields a sort of camboge; and the *Hypericum mexicanum*.

Camboge is more extensively used as a pigment than as a medicine.

An artificial camboge is manufactured with turmeric and other materials. This should always be rejected.

CAMBRAY or **CAMBRAI**, an important city of France, in the department of Nord. It is on the eastern or right bank of the Escaut or Scheldt, 100 miles in a direct line N.N.E. of Paris, or 105 miles by the road through Senlis, Roye, and Peronne; in 50° 10' N. lat. and 3° 14' E. long.

In the latter period of the Roman empire this city rises to notice under the name of *Camuracum*, by which it is mentioned in the Itinerary of Antoninus and the *Tabula Peutingeriana*. In the *Notitia Provinciarum* it appears as one of the capital towns of the Nervii: *Turnacum* (Tournay) being the other. In the infancy of the Frankish monarchy in Gaul, Cambray is said to have been the capital city of Clodion, the son of Pharamond (A.D. 427—448), and to have given title to his kingdom. Charlemagne fortified the town, and Charles le Chauve (the Bald) ceded it to its bishops, by whom the sovereignty of it was long retained. It had its castellans or viscounts, who paid homage and allegiance to the bishop. In 1510 the Emperor Maximilian I. erected Cambray into a duchy and principality of the empire in favour of the then bishop and his successors. In 1543 the Emperor Charles V. rendered himself master of the place, and erected the citadel, one of the strongest in Europe, on a height at the eastern extremity of the city. In 1581 this city, which was in the hands of the Protestants of the Netherlands, was besieged by the prince of Parma, but the approach of the duke of Alençon with succours compelled him to raise the siege. The fortifications were much strengthened by Vauban. In the advance of the allied armies after the battle of Waterloo, Cambray was taken by escalade, 24th June, 1815, by a detachment of the English army, commanded by Sir Charles Colville.

The city of Cambray is large; the streets are of tolerable width, but not regularly laid out, and there are a great number of old houses that present their gables to the street. The *Place d'Armes* is capable of containing all the garrison drawn up in order of battle. There are some handsome public buildings. The cathedral contains a monument of Fénelon, and its steeple is remarkable for the delicacy of the architecture. The town house is a handsome modern edifice. The episcopal palace is a large building.

Considerable manufactures are carried on at Cambray. Its lawns and fine linens have acquired such reputation that their name has passed in Great Britain into a general designation (Cambric) for goods of that sort. Handkerchiefs like those of Madras are made here; also cloths, hosiery, lace, carpets, and white leather, common earthenware, and soap. The population of the town in 1832 was 14,570, that of the whole commune 17,646.

The navigation of the Escaut commences at Cambray, and opens a communication with those parts of the Netherlands which are watered by that river. Cambray has also a communication with St. Quentin by canal, which is connected with the navigation of the Somme on the one hand, and the Oise on the other.

There are in the town a theatre, a school of anatomy, a seminary for the priesthood, a high school, and a public library of 27,000 volumes.

Cambray was early the seat of a bishopric. In 1562 the bishop was raised to the rank of archbishop, and had the bishoprics of Arras, Tournay, St. Omer, and Namur given to him as his suffragans. This archbishopric was held by the pious Fénelon. In the changes which have resulted

from the French revolution the see has been again reduced to the rank of a simple bishopric. The bishop is a suffragan of the archbishop of Paris, and has for his diocese the department of Nord.

Cambray is the capital of an *arrondissement*, which had in 1852 a population of 152,444.

CAMBRESIS, a district formerly in the Low Countries, now included in France, having Cambray for its capital. It is a small district, bounded on the N. and E. sides by the county of Flanders, on the S. by the districts of Vermandois and Thiérache, and on the W. by the county of Artois. It is a fertile country, watered by the Escaut or Scheldt and its tributaries (the Senet and the Selle), and by the Sambre, and the Meuse. It produces grain of all sorts, and is also a good pasture to many sheep and horses.

It was originally part of the territory of the Nervii, a tribe of the Belgæ; under the Roman empire it was included in the province of Belgica Secunda, and on the downfall of the Western empire came into the hands of the Franks. Being subsequently comprehended in the Germanic empire, it was erected by the emperors into a county, held for 400 years by laymen, but afterwards ceded to the bishops of Cambray. It was appropriated by Charles V.; and though during the troubles of the Netherlands the possession of it was contested, it remained to the Spanish branch of the Austrian family. In 1677 it was conquered by Louis XIV., and confirmed to France, from which it has not since been separated, by the peace of Nimègue, 1678.

The three chief places are Cambray (population, 14,510, town; 17,446, whole commune), Le Cateau (population, 5814, town; 5946, whole commune), and Crevecoeur (population, 1776, town; 2001, whole commune).

CAMBRIDGE, the county town of Cambridgeshire, is in the hundred of Flendish, about 48 miles (direct distance) N. by E. from London. It takes its name from the more modern appellation of the river on which it is situated, the antient name of which was Granta, and is still retained above Cambridge. In the record of Domesday the town is called *Grantebrige*; *Grantchester* is now the name of a small village near Cambridge. The first well-authenticated fact relating to its history is the burning of it by the Danes in 871, and it is again mentioned as destroyed by the same enemies in 1010. While the isle of Ely was held against William the Conqueror by the English nobility, that monarch built a castle at Cambridge—Grose says in the first year of his reign; Ordericus Vitalis says in 1068. That the town had risen to considerable importance at the time the Domesday Survey was formed, is evident from the description of it in that record. In 1088 Cambridge shared the fate of the county in being laid waste with fire and sword in the cause of Robert Curthose. To compensate the impoverishment of the townsmen in this calamity, King Henry I. exempted them from the jurisdiction of the sheriff, upon condition of their paying 101 silver marks annually into the exchequer, which rent had till that time been paid by the sheriff. It appears, nevertheless, that in the succeeding reign the burgesses gave the sum of 300 marks of silver and one mark of gold for a confirmation of this privilege.

In 1174, a fire happened at Cambridge which, among other extensive damages, injured most of the parish churches, and destroyed that of the Holy Trinity. King John, in the first year of his reign, in consideration of 250 marks, granted the townsmen of Cambridge the same privileges as the king's free and demesne burgesses. In the following year he granted them a mercatorial gild, with extensive privileges; and in 1207 the liberty of being governed by a provost, to be chosen annually by themselves. The style of their government was afterwards altered by King Henry III. to that of a mayor and four bailiffs.

King John was at Cambridge on the 16th Sept., 1216, about a month before his death. On his departure he intrusted the defence of the castle to Fulco de Brent, but it was soon afterwards taken by the barons; and after the king's death a council was held at Cambridge between the barons and Louis the French king. In 1249 we have the first notice of great discord between the townsmen of Cambridge and the scholars of the university. Subsequent dissensions between them frequently occur in different periods of their annals. In 1381, in consequence of the lawless proceedings of the townsmen in destroying the charters of the university and those of Benet College, King Richard II. deprived the burgesses of their charter, and bestowed all the privileges with which they had been invested upon the uni-

versity. Not long after this event, in 1388, the king held a parliament at Cambridge. Nothing remarkable occurs in the history of Cambridge for the next two centuries, except a royal visit from King Henry VII. in 1503, and the restoration of their charter to the burgesses by Henry VIII. with abridged privileges, by which they were rendered more subordinate to the university than they had been under their former charter. Upon the first symptoms of an approaching war between King Charles I. and his parliament the university of Cambridge demonstrated their loyalty; but in 1643 Cromwell, who had twice represented the borough, took possession of the town for the parliament, and put in it a garrison of 1000 men. In the month of August, 1645, the king appeared with his army before it, but we have no account of any siege or assault upon the town; nor does anything occur which connects it with the civil history of the country from that to the present time.

The corporation, till the passing of the late Municipal Reform Act, consisted of a mayor, twelve aldermen, twenty-four common-council-men, four bailiffs, a high steward, recorder, town-clerk, and other officers. The governing body now consists of a mayor, ten aldermen, and thirty councillors. The mayor upon entering into office takes an oath to maintain the privileges, liberties, and customs of the university.

When the Survey of Domesday was taken, the town of Cambridge contained 373 *masures* or messuages, of which 47 were in ruins, and 27 had been destroyed for the purpose of building the castle. In 1377 the number of persons in Cambridge charged to a poll-tax (from which the clergy, children under fourteen years of age, and paupers were exempted) was 1722. In 1749 the number of houses was 1792, of which 156 were inns and public-houses; the number of inhabitants 6131. In 1801 the number of inhabitants, exclusive of the university, was 9276; and in 1811, 10,294. The population, including the university, in 1821, was 14,142; and in 1831, 20,917. Although the town was so much smaller when the Domesday Survey was taken, it was then divided into ten wards; the subsequent division was into four, but under the Municipal Reform Act it has been divided into five wards.

The parishes are fourteen in number:—All Saints, St. Andrew the Great, St. Andrew the Less or Barnwell, St. Benet, St. Botolph, St. Clement, St. Edward, St. Giles and St. Peter united, St. Mary the Great, St. Mary the Less, St. Michael, St. Sepulchre, and Trinity; besides which there are said to have been formerly the churches of St. John, St. Nicholas, St. Zachary, St. Peter without Trumpington Gate, All Saints in the Jewry, and the Chapel of St. Edmund. None of these are handsome buildings. St. Sepulchre's church is one of the few churches in England that has a round tower. It was built in imitation of the church of the holy sepulchre at Jerusalem.

The town of Cambridge has sent members to parliament from the earliest period of our parliamentary records, and it still sends two members. No alteration was made in the boundaries of the borough under the Municipal Reform Act.

Of the public buildings of Cambridge the castle, which is said to have been erected on the site of a Danish fortress, has been already mentioned. It was suffered to go to decay at least as early as the reign of Henry IV. All that remains of the antient buildings is the gate-house. A county-gaol has since been erected close to it, from a convenient and extensive plan of John Howard. The shire-hall, in which the assizes and quarter-sessions for the county are held, was built in 1747. The town-hall, belonging to the corporation, was built in 1782; opposite to which is a conduit, erected in 1614 by Thomas Hobson the carrier, who left lands for its repair.

Among the religious foundations antiently existing in Cambridge not connected in their origin with the university were, the house of Austin Canons, founded in 1092, originally placed in or near the church of St. Giles; the Benedictine nunnery of St. Rhadagund, now forming a part of Jesus College, founded in 1130; the Grey Friars or Franciscans, founded soon after 1224; the Carmelite Friars in 1257; the Friars de Sacco, 1258; the Dominican or Black Friars, founded before 1263; the house of Brethren of St. Mary, in the parish of All Saints, 3 Edward I.; the Austin Friars, founded in or near the Fishmarket, called Base-hill, about 1290; the White Friars, brought from Newenham in 1291; the Gilbertine Canons, established about the same time; the Hermitage of St. Anne, and Hospital of St. Mary Tangmer before 1397; and the

ancient Hospital of St. Mary Magdalen for Lepers at Stourbridge.

A fair was held at Cambridge from very antient times in Rogation Week. It was recognized and confirmed in a charter of the 2nd of King John. Another, at the festival of the Assumption of the Virgin Mary, was granted by King Henry VI. to the nuns of St. Rhadegund in 1438. In the parish of Little St. Andrew or Barwell are held Midsummer Fair and Stourbridge Fair, which are annually proclaimed by the principal officers of the university with much solemnity; the former was held for a fortnight on a common called Midsummer Green; the latter, supposed to be of very great antiquity, is proclaimed on the 18th of September, and used to continue for three weeks. The duration of both fairs has been considerably shortened. Cambridge market, which has been held from time immemorial on Saturday, is a great mart for corn and butter. Brawn and Stilton cheese are also considerable articles of trade.

By means of locks the Cam is now navigable up to Cambridge, and by it the town is supplied with coals, &c. through Lynn, where the Ouse enters the sea.

(Gough's edit. of Camden's *Britannia*: Lysons's *Magna Britannia* for Cambridgeshire; and Merewether and Stephens's *History of Boroughs and Municipal Corporations*, 3 vols. 8vo. London, 1835.)

CAMBRIDGE, UNIVERSITY OF. The first establishment of this university is involved in much obscurity. Although some writers have carried back its origin to a more remote date, it seems probable that Cambridge first became a seat of learning in the 7th century: when, as Bede (*Hist. Eccl.*, lib. iii. c. 18.) informs us, Sigebert, king of the East Angles, with the advice of Felix the bishop, instituted within his kingdom a school for learning, in imitation of what he had seen in France: this school is presumed to have been fixed at Cambridge. It is certain that from a very early time Cambridge was the residence of numerous students, who at first lived in apartments hired of the townsmen, and afterwards in inns or hotels, where they formed a community under a principal, at their own charge. Some say that Edward the Elder, when he repaired the ravages of the Danes at Cambridge, erected halls for students, and appointed professors; others maintain that a regular system of academical education was not introduced till the year 1109, when the abbot of Croyland having sent some learned monks, well versed in philosophy and other sciences, to his manor of Cottenham, they repaired to the neighbouring town of Cambridge, whither a great number of scholars flocked to their lectures, which they arranged after the manner of the University of Orleans.

The first charter known to have been granted to Cambridge as a university is that of the 15th Henry III., which grants the privilege of appointing certain persons, called taxors, to regulate the rent of lodgings for the students, which had been raised to an exorbitant height by the townsmen: this was almost fifty years before the foundation of Peter-house, the first endowed college. In 1333 King Edward III. granted the university some important privileges. These distinguished favours caused the townsmen to be more than ever jealous of the authority of the university, and their discontents, as already noticed in the account of the town, at length broke forth into open violence in the succeeding reign, when, emboldened by the temporary success of Wat Tyler and his associates, they seized and destroyed the university charters.

In 1430, Pope Martin V. determined, from the testimony of antient evidences, that the university was exclusively possessed of all ecclesiastical and spiritual jurisdiction over its own scholars.

Queen Elizabeth, in the third year of her reign, granted an extensive charter to this university; and by an act of parliament, 13 Eliz. c. 29 (for the incorporation of both the English universities), this and all preceding grants were confirmed, and the university of Cambridge was declared to be incorporated by the name of the Chancellor, Masters, and Scholars. The office of Chancellor, as chief magistrate of the university, had existed from a very early date: it was only annual till 1504, when Bishop Fisher was chosen chancellor for life: at present the office is biennial, or tenable for such a length of time beyond two years as the tacit consent of the university may allow. The other principal officers are, the High Steward, the Vice-chancellor, a Commissary, who holds a court of record for all privileged persons under the degree of M.A., a Public Orator, an

Assessor, to assist the vice-chancellor in his court, two Proctors, whose business it is to regulate the discipline and preserve the peace of the university, a Librarian, a Registrar, two Taxors, who regulate the market, examine the assize of bread, and inspect the weights and measures, two Moderators, who superintend the exercises in the schools and the examinations for degrees in Arts, two Serenators, who regulate the business of the congregations, two Proctors, three Esquire-bedels, and some inferior persons.

The following are the colleges of this university, with the dates of their respective foundations:—Peter-House, 1287; Clare Hall, 1326; Pembroke College, 1343; Gonville and Caius, 1348; Trinity Hall, 1350; Corpus Christi, 1354; King's, 1441; Queen's, 1446; Catharine Hall, 1473; Jesus, 1496; Christ's, 1505; St. John's, 1511; Magdalen, 1519; Trinity, 1546; Emmanuel, 1584; Sidney Sussex, 1598; Downing, 1800. [PETER-HOUSE, &c.]

The other public buildings belonging to the university are the senate-house, the library and schools, the botanic garden, the Pitt press, and the observatory. The senate-house, an edifice of the Corinthian order, was erected in 1722, from a design of Sir James Burrell. The schools were erected in 1443, at the expense of the university, assisted by liberal benefactions. The botanic garden occupies three or four acres: the ground, with a large and antient edifice, formerly belonged to the Augustinian Friars; it was purchased by the late Dr. Richard Walker, vicemaster of Trinity college, for 1600*l*. The old schools still remain, and belong to the Jacksonian professor for the time being; and a new building has been erected for the use of the lecturers in chemistry, botany, and anatomy. The Pitt press, or printing-house, was begun in 1831 and finished in 1833. The observatory was erected between 1822 and 1824, after the designs of Mr. J. C. Mead, at an expense of upwards of 18,115*l*.

The infirmary, called Addenbrooke's Hospital, was originally founded under the will of Dr. John Addenbrooke, the building of which was begun in 1753, but upon its completion in 1766, the funds being found insufficient for its support, an act of parliament passed to make it a general hospital. It has been since supported by voluntary contributions. The building was considerably enlarged a few years ago, under a bequest of Mr. Bowtell.

Richard Viscount Fitzwilliam, who died in 1816, bequeathed to the university his collection of books, paintings, drawings, &c., with the interest of 100,000*l*. South Sea annuities for the erection and endowment of a museum. This collection, called the Fitzwilliam Museum, is at present placed in the old free-school behind Corpus Christi college. Another museum, consisting chiefly of a collection of pictures, was bequeathed to the university by the late Mr. Mesman: they are for the present suspended in an apartment at the Pitt press.

Each college is a lay corporate body, bound by its own statutes; but the members of each college are also subject to the general laws of the university. The present university statutes were given by Queen Elizabeth in the 12th year of her reign, and are the foundation upon which all new laws are framed. Each of the seventeen colleges furnishes members both for the executive and legislative branch of university government. The place of assembly is the senate-house. All persons who are masters of arts, or doctors in one of the three faculties, viz. divinity, the civil law, or physic, having their names upon the college boards, holding any university office, or being resident in the town of Cambridge, have votes in this assembly. The senate is divided into two houses, denominated the Regent and the Non-Regent House: the former consisting of the doctors of less than two and the M. A.'s under five years standing; the latter, of the M. A.'s above five years. The doctors of more than two years' standing vote in either house at pleasure. There is also a council called the Caput, chosen annually on the 15th of October, by which every university grace or proposition must be approved, before it can be introduced to the senate. The caput consists of the vice-chancellor, a doctor in each of the faculties, and two masters of arts, who are the representatives of the regent and non-regent houses. Any single member of the Caput has the power of putting a veto upon any grace that is proposed.

The annual income of the university arises from various sources. The rectory of Barwell and a farm at Barton produce about 1000*l*. per annum; the produce of fees at matriculations, for degrees, &c., and the

the university press, chiefly resulting from its share of the monopoly of printing Bibles, are supposed to average each about 2000*l*. The whole income from every source is believed scarcely to exceed 5500*l*. per annum. The funds are managed by the vice-chancellor, or by specific trustees; and the accounts are examined annually by three auditors appointed by the senate.

The public professors of the university are paid from various sources; some from the university chest, others from the majesty's government, or from estates left for that purpose. They are the Lady Margaret's Professor of Divinity; the Regius Professors of Divinity, Civil Law, Physic, Hebrew, and Greek; two Professors of Arabic, one of whom is called the Lord Almoner's Reader; the Lucasian Professor of Mathematics; Professors of Casulistry; Chemistry; Experimental Philosophy; Anatomy; Modern History; Botany; Geology; Astronomy; the Norrisian Professor of Divinity; Natural and Experimental Philosophy; the Downing Professors of the Laws of England, and of Medicine; the Professors of Mineralogy, Political Economy, and Music; besides which there are various endowed Lectureships. The Cambridge Philosophical Society was established in 1819, and incorporated by a Royal Charter dated 3rd August, 1832. It includes most of the resident graduates of the university.

The privilege of sending two representatives to parliament was conferred upon the university by charter, in the 1st of James I. The right of election is vested in the members of the senate, in number about 1900. The vice-chancellor is the returning officer.

(Gough's edit. of Camden's *Britannia*; Lysons's *Magna Britannia*, ut supra; Dyer's *History of the University and Colleges of Cambridge*; and the *Cambridge University Calendar*; to which last work the reader is referred for more particular information on the existing state of the university, its scholarships, degrees, prizes, &c.)

CAMBRIDGE, a town in Middlesex county, in the State of Massachusetts, about three miles W.N.W. of Boston, with which it is connected by the west Boston bridge and canal bridge across Charles River.

When founded by the New England settlers, this place received the name of New Town, but after the establishment of Harvard College the name was changed to that which it now bears, in compliment to the English University of Cambridge. The population of the town, according to the census of 1820, was 3295: in 1830 it had increased to 6071.

Harvard College, now styled Harvard University, was founded in 1636 with funds, to a very limited amount, advanced by the province; it was incorporated in 1638, and in the same year received a bequest of about 800*l*. from the Rev. John Harvard, on which account the institution was named Harvard College. Its endowments have since been greatly increased by donations from the public funds of the state, and by many private contributions, so that it has become the most richly-endowed place of education in the United States. Its property, according to the treasurer's report in October, 1832, amounted to 395,889 dollars: its annual income during the same year was 40,962; and the expenditure 41,054 dollars. Rather more than one-half of the income was derived from payments made by the students.

The university comprises the collegiate department, and the departments of divinity, law, and medicine. It contains four halls, each four stories in height, which are set apart for the accommodation of the under-graduates. There are besides two halls, containing the library, cabinet of minerals, chapel, and various other public rooms; a divinity hall, a law hall, and other buildings. The medical hall belonging to the university is situated in Boston. The number of under-graduates in 1833 was 212; of theological students, 31; of law students, 50; and of medical students, 82—making together 375 students. The whole number of alumni there amounted to 5863, of whom 2265 were living. The library contains above 40,000 volumes: 35,500 are in the general library; 3000 are in the law library; 1000 in the medical; and 650 in the theological library. The medical library, said to contain 4000 volumes, is in Boston. There is also a library belonging to the students, which contains 4500 volumes. The institution possesses valuable chemical and philosophical apparatus, and an extensive cabinet of minerals. There is also an excellent anatomical museum, and a botanic garden, containing seven acres of land. The university is governed by a corporation, consisting of seven members, one of whom must be the president of the univer-

sity, and a board of overseers, composed of thirty elected members, in addition to the governor, the lieutenant-governor, the members of the State Council and Senate, and the speaker of the House of Representatives, all of whom are members of the board of overseers *ex officio*. The teaching body consists of the president, 21 professors, 2 tutors, and various assistants. The immediate government is in the hands of the president, part of the professors, and the tutors.

The first printing executed in British America was performed at Cambridge in 1639, with an apparatus sent from England in the preceding year by the Rev. J. Glover, a dissenting minister. The first thing printed was 'The Freeman's Oath'; the second was an almanac. The first book that issued from the Cambridge press was a version of the Psalms in metre, printed in 1640. In 1663 an edition of the Bible, translated into the Indian language, was printed. Cambridge was for thirty-five years the only place in New England in which printing was carried on. In 1834 the town had five monthly and two quarterly literary journals.

The town contained, in 1833, three joint stock banks, with capitals amounting in the aggregate to 400,000 dollars.

CAMBRIDGE MANUSCRIPTS. [BEZA'S MANUSCRIPT.]

CAMBRIDGESHIRE, an inland county of England, lying between 52° 1' and 52° 45' N. lat., and 0° 31' E. and 0° 15' or 0° 16' W. long. It is of an irregular oblong form, having its greatest length about 51 miles, measured N. by W. and S. by E. from Tyd St. Giles, near Wisbeach, to Castle Camps, near Linton; and its greatest breadth 32 miles, from Gamlingay, near the border of Bedfordshire and Huntingdonshire, to Ashley, near Newmarket. It is bounded on the N. by Lincolnshire; on the E. by Norfolk and Suffolk; on the S. by Hertfordshire and Essex; and on the W. by Bedfordshire, Huntingdonshire, and Northamptonshire. Cambridge, the county town, is 48 or 49 miles in a direct line N. by E. from London, or 50½ miles by the road through Ware, Buntingford, and Royston, or 56 miles by Epping, Stanstead, Newport, and Great Chesterford. The superficial measurement of the county is 584,480 acres, or 857 square miles; and the population in 1831 was 143,955, or about 168 to a square mile.

Surface, Hydrography, and Communications.—The whole northern part of the county and a considerable part of the centre are comprehended in the vast tract of fen-land known as the Bedford Level. The inclosures in this part are chiefly formed by ditches, and the country presents few trees except pollard willows. The towns and villages are on spots which rise above the general level of the fens, and the churches crowning these slight elevations may be distinguished at a considerable distance. To these insulated eminences the designation of *ey* (island) appears to have been applied; and hence Thorn-ey, Whittles-ey, Rams-ey (Huntingdonshire), and other places, derive part of their name. The designation of 'the Isle of Ely' was at first restricted to the insulated eminence on which Ely stands, though it has now a much more extended signification. The southern part of the county has gently-rising hills, with some wood in the parts bordering on Suffolk, but little in other places. The Gogmagog hills, S.E. of Cambridge, are the highest in the county. Coach and Horses hill, or Orwel hill, S.W. of Cambridge, is about 302 feet above the level of the sea; and Madingley hill, W. of that town, 238 feet.

The chief rivers of the county are the Nene and the Ouse, with its tributaries, the Cam, Lark, &c.

The Nene has only the lower part of its course in this county, the border of which it touches just below Peterborough, where it is divided, and flows in three channels. One arm, under the name of Catswater and the Shire Drain, winds to the N.E., and forms the boundary between Cambridgeshire on the one hand and Northamptonshire and Lincolnshire on the other. Another arm, under the names of Whittlesey Dyke* and the Well Crook (or the Old Nene River) passes to the E. by Whittlesey and March, and joins the Ouse at Salter's Lode Sluice. The third arm (Morton's Leam) proceeds in a tolerably direct line E.N.E. to Wisbeach, and from thence N. into the Wash. The Shire Drain joins this just at its outfall. The natural channel of the river can now hardly be distinguished, so much has the river become connected with the immense system of artificial drainage and navigation carried on in this part of the country.

* This dyke is a cut, saving the very circuitous navigation through Whittlesey, Ramsey, and Ugg Mores, through which this arm of the Nene passed.

The Ouse first joins this county below St. Ives, and winds N.E. to the Hermitage Sluice, dividing Huntingdonshire from Cambridgeshire. At Hermitage Sluice the river, in its natural course, turns to the S.E., and again gradually to the N.E., receiving the river Cam. It then passes the city of Ely, below which it is joined by the Lark. From the junction of the Lark it flows N.E. for a few miles, re-enters the Little Ouse from Thetford and Brandon; at it it leaves Cambridgeshire and enters Norfolk, which county it flows northward till it enters the Wash below Lynn. The original course of the Ouse below Littleport, near the junction of the Lark, is supposed to have been very different from the present course. From Hermitage Sluice a navigable cut, called the New Bedford River, runs N.E. in a direct line across Cambridgeshire into Norfolk, after entering which it joins the Ouse at Denver Sluice, where the Old Nene River also joins the Ouse. The natural channel between Hermitage and Denver Sluice is now only navigable, or at least is only used for navigation, so far as is requisite for the navigation of its tributary streams, the Cam and the Lark. A canal from Wisbeach to the Old Nene River connects the navigation of the Nene and the Ouse.

The measurements of these rivers are about as follows:—Nene, 1st arm (Catwater and Shire Drain), to its outfall, about 28 to 30 miles; 2nd arm (Old Nene), to its junction with the Ouse, about 28 miles, of which 23 are in Cambridgeshire or on the border; 3rd arm, or Morton's Lcam and Wisbeach River, from Standground Sluice to Wisbeach, 19 miles; from Wisbeach to the Wash, 6 miles; Nene Outfall, through the sands of the Wash, 8 miles (6½ cut and a further channel of 1½ miles worked by the river itself): total, 33 miles. Ouse, on the border of the county to Hermitage Sluice near Bluntisham, 5 miles; to junction of Cam, 12; to Ely, 3; to junction of Lark, 3; to junction of Little Ouse, along the border of the county, 7: total, in or upon the border of Cambridgeshire, 30 miles. The remainder of the course of the river is as follows:—to the junction of the New Bedford River at Denver Sluice, 6 to 7 miles; to Lynn, 15; to the outfall, 3: total, 24 or 25 miles. The length of the New Bedford River between Hermitage and Denver Sluices is 21 miles, of which about 15 are in Cambridgeshire: the length of the natural channel of the Ouse between the same points is 31 or 32 miles.

The Cam, or Granta, is formed by the junction of several small streams which rise in Essex, the principal one of them between Saffron Walden and Dunmow. This flows N. to Audley End, near Saffron Walden, and thence by Great and Little Chesterford, Duxford, Whittlesford, Great and Little Shelford, and Granchester, to Cambridge, receiving the Linton, from the town of Linton, above the Shelfords, and the Rhee and Bourn from the S.W. and W., above Granchester. From Cambridge, where the navigation commences, the Cam runs N.N.E. and falls into the Ouse about 3 miles above Ely: length, above Cambridge, about 25 miles, of which half are in this county; from Cambridge to the junction with the Ouse, 15 miles.

The Lark, navigable as far as Bury St. Edmunds, properly belongs to Suffolk. It separates that county from Cambridgeshire for about 7 miles before its junction with the Ouse: and the Kennet brook, a feeder of the Lark, forms the boundary between these two counties about 7 miles before it falls into the Lark.

The canals of these counties are not numerous, except those connected with the fen district, the principal of which have been already noticed. [BEDFORD LEVEL.] There is a canal from the neighbourhood of Ramsey, Huntingdonshire, called the Forty Foot, or Vermuiden's Drain, to the Old Bedford River, which is a cut now scarcely used for navigation, parallel to the New Bedford River. There are navigable cuts from the Ouse to Soham and Reche, and a canal running nearly N. and S. (the London and Cambridge Junction Canal) connecting the Cam below Cambridge with the Stort (at Bishop Stortford) and the Lea, and ultimately with the Thames. There is a branch from this canal at Great Shelford to Whaddon, between Royston and Huntingdon.

The chief roads are those from London to York and Edinburgh (the Great North Road), to Norwich by Newmarket, and to Cambridge; from Cambridge to Huntingdon, Newmarket, and Lynn; and from the Great North Road by St. Ives to Wisbeach.

The Great North Road enters the county at Royston, 37 miles from town, and traverses it in a direction about N. by

W., without passing through any market town, until it enters Huntingdonshire, between 52 and 53 miles from town. The road from London to Cambridge through Royston turns off from the Great North Road at Royston and runs N.E. to Cambridge about 13 miles. Another road to Cambridge, branching off from the Great North Road at Ely, enters Herts, enters Cambridgeshire near Fulmer or Foul, and unites with the road through Royston at Hawkston, about 5 miles short of Cambridge.

The Norwich and Newmarket Road enters the county just beyond the village of Great Chesterford, about 46 miles from London, and runs N.E. to Newmarket, and finally quits the county to enter Suffolk about 5 miles beyond Newmarket and 66 from London. A third road, to Cambridge, branches off from this road just before it enters the county, and runs N. by W. about 10½ miles.

The road from Cambridge to Huntingdon runs N.W. about 15½ miles, of which about 10 are in Cambridgeshire; for the last mile it coincides with the Great North Road, which meets it at Godmanchester. The road from Cambridge to Newmarket runs E. by N. 13 miles, uniting with the Norwich and Newmarket Road about 2 miles from the latter town. The road from Cambridge to Lynn runs N. by E. through Ely, and quits the county at Littleport Bridge, 22 miles from Cambridge.

The N. part of the county is traversed by a road which branches off from the high North Road just where this leaves Cambridgeshire to enter Huntingdonshire, and running N.N.E. through St. Ives, re-enters Cambridgeshire at Chatteris Ferry, 70 miles from London, and runs 21 miles through March to Wisbeach, from whence it runs farther N. into Lincolnshire, to Holbeach, Spalding, and Boston.

A road runs from Cambridge over the Gogmagog Hills to Linton, and thence into Suffolk and Essex to Haverhill, Halsted, and Colchester; and there are two turnpike-roads from Ely, one to Soham in the direction of Newmarket and Bury St. Edmunds, and one to Chatteris, where it meets the road from St. Ives to Wisbeach.

Geological character.—The south and south-eastern parts of the county are occupied by part of the great chalk formation which extends, within the limits of Cambridgeshire, from Newmarket heath to Royston: it forms the mass of the Gogmagog hills, S.E. of Cambridge, and of the Royston downs, which are connected with the Luton and Dunstable downs (Bedfordshire), and by them with the Chiltern hills (Bucks.). There are also in Cambridgeshire two masses of this chalk detached from the principal mass,—the Coach and Horses hill, near Orwel, S.W. of Cambridge, and Madingley hill, W. of Cambridge. The chalk of Cambridgeshire consists of two varieties, the upper containing an abundance of the common black flint, and the lower or grey chalk, which contains little or none. The upper is found in the S.E. part of the county: the lower chalk forms the principal hills, and occupies the N.W. part of the chalk range. The chalk is furrowed transversely by the depression through which the London and Cambridge canal passes, and which separates the Gogmagog hills from the Royston downs. The district N.E. and E. of Cambridge is the most level chalk district in England; its flatness alone gives importance to the otherwise inconsiderable eminences of the Gogmagog hills. The chalk district of Cambridgeshire dips gently to the S.E.

The diluvial beds of loam, mixed with fragments of chalk, which overspread the upper part of the basin of the Stour in Essex and Suffolk, covering the chalk, extend a short distance into the adjacent parts of Cambridgeshire.

The chalk rests upon a blue clay, called in the county *galt*, which is considered as a variety of the chalk-marl formation that crops out from beneath the north-western boundary of the chalk. This formation occupies a greater extent of surface than it usually does, extending to the boundary of Huntingdonshire and Bedfordshire; its thickness is variable, averaging perhaps 200 or 220 feet. It is nearly impervious to water.

In a few places along the irregular line which separates this county from the two just mentioned, the iron-sand, which underlies the *galt*, rises to the surface. It forms excellent garden ground. Throughout the whole of this formation many fragments of mineralized wood are found; when dry they crumble into a fine powder; but when moist and fresh from the earth are definite in form, and have the bark in the utmost state of preservation. (Compare and Phillips's *Outlines of the Geology of England and Wales*;

Geol. Transact. vol. vi. *Greenough's Geological Map of England* &c.

The whole of the northern part of the county is over-spread with the fens [*Boston Level*]; the greater part of which in this county are comprehended in the Isle of Ely. At a former period this designation was confined to the higher ground round Ely, which rose out of the marshes, and was surrounded by them; but the application of the name has been much extended. The marshes S. of the Old Ouse, about Soham, Wicken, and Reche, are not included in the Isle.

Culture, &c.—The soil of this county is extremely various, consisting of clay, loam, and chalk, both in the uplands and the fens. Although there are some poor common and heaths, the greater part of the land is fertile. In some spots called white land, which have chalky subsoils, great crops of wheat and beans are raised. The Burwell wheat is in great request for seed in many parts of England, and the cheeses of Cottenham indicate considerable richness in the pastures. The climate in the uplands is mild and healthy, but in the fens, especially those which have not been thoroughly drained, agues and fevers prevail when the water has evaporated and left the land in a half dry state. When the land is quite flooded the air is less impregnated with unhealthy effluvia. In proportion as the fens are drained and the land is cultivated, the air becomes more healthy.

The upland district is sufficiently varied to afford good situations for residences; but until the beginning of this century, a very small proportion of the land was inclosed. Above three-fourths of the surface was occupied by commons, common-fields, heaths, and fens. Of these many have been inclosed within the last thirty years; and in the course of time the whole face of the country will be much improved by the growth of trees and hedge-rows. There are few counties where so many inclosures have taken place under special acts of Parliament. The villages were mostly situated in hollows, between gentle elevations, where the soil was naturally most fertile, and being scattered through an open country, with their small inclosures and orchards, presented insulated green spots, which formed a strong contrast with the surrounding open fields entirely destitute of trees. The fen district is a dead flat intersected with ditches, canals, and sluggish streams. The soil consists of mud mixed with decayed and half-decayed vegetable matter. When the superfluous water has been removed, a soft spongy surface is left, which is much improved by burning. The ashes thus produced by being mixed with the soil greatly enrich it, and the most luxuriant crops are obtained without any other preparation. When a judicious rotation is adopted, and the ground is not too much exhausted to be restored by proper manures, this land, which is reclaimed from a state of comparative unproductiveness, becomes very valuable. But the temptation of immediate profit frequently induces the farmer to raise exhausting crops from it, as long as they will grow without fresh manuring, by which means the soil is so impoverished, and its staple* so reduced, that subsequent tillage or manuring cannot recruit it for a very long time.

The first operation on a newly-inclosed fen, when it has been drained, is to pare the surface, on which coarse grass and sedge are growing in a matted state. The sods are cut about three inches in thickness and of various lengths and breadths, by means of a paring plough. This is a sharp instrument drawn by two horses, which cuts horizontally under the surface, and is guided by two handles like a plough. The sods being set on edge to dry partially are then arranged in the form of a small kiln with proper air-vents, and lighted by means of brush-wood or straw. As soon as they begin to flame more sods are added, and the fire is prevented from breaking out by immediately covering with a sod every place from which the smoke issues strongly. In a short time a great quantity of sods is reduced to a carbonized mass, which, when cool, is spread over the ground. This is immediately ploughed in, and the land is sown with cole-seed or rape, of which an abundant crop is invariably produced. The cole is fed off with sheep, the land ploughed once, and oats are sown, which produce astonishing crops. This is succeeded by wheat, or sometimes by another crop of oats, in which are sown clover and grass seeds, which soon cover

the ground with fine herbage. The land is left in grass as long as the grass is good. As soon as it begins to decline in quality or produce, it is ploughed up and sown with oats, or it is again pared and burnt as

The most common practice however, when the soil is very rich, is to take crops of cole-seed, wheat, barley, and oats, and not to sow grass seeds till after several crops have been obtained taking care however to keep the land clean. The newly-drained fens is very loose, and requires to be pressed after the seed is sown. This is sometimes done by men treading the ground with their feet, or by driving sheep over it; but the land-presser [*ARABLE LAND*, vol. ii. p. 225] is particularly adapted to this purpose. It not only consolidates the land, but forms drills for the reception of the seed. The grasses usually sown with the last crop of barley or oats are, of rye-grass two bushels and of white clover ten pounds. Where the land is cultivated with care the use of rape-cake as manure is common. It has the advantage of being readily brought from a distance; 1000 cakes weigh about a ton, and are sufficient for three acres. The rape-cake is ground to a powder, which is drilled with the seed by a machine. It ensures a crop of corn on land which has been exhausted, and in this way it is a matter of simple calculation whether it repays the expense. But the most advantageous mode of using it is to sow it with cole or turnip-seed, and to feed off the crop with sheep; permanent improvement of the soil is thus produced, and the land is recruited for several crops.

Besides corn and hay, the fens, where they have not been brought into cultivation, produce turf for fuel, and reeds and sedges for thatching and lighting fires. An acre of ground will produce 300,000 turves, 5000 of which are considered to be equal to forty bushels of coals. The price varies from 6s. to 10s. per thousand, according to the situation and comparative price of coals. Osier beds are likewise formed in some places, and give a good return.

In the uplands towards Hertfordshire and Suffolk, the land was formerly cultivated on the old three-field system, and there are still farms where a summer fallow is regularly succeeded by wheat or barley, and that by oats, with the occasional introduction of clover or beans. But where a better system has been adopted after the inclosure of the common fields, turnips form the foundation of the course on all lands which are sufficiently dry to allow sheep to be penned on them. On some stiff clays, cabbages have been introduced, and cultivated to some extent. The large red cabbage is preferred by many to the drum-head, because it is not so liable to be attacked by caterpillars. They manure the land for this crop with twenty or thirty good loads of farm-yard dung per acre, and find the produce very valuable for cattle and sheep in winter. In the rich white land, wheat and beans are sown alternately, as long as the land is clean: and if the beans are drilled and well hoed, and the land moderately manured for this crop, this simple and profitable rotation may go on for a considerable time.

By the introduction of sainfoin on some of the thin chalky lands, a soil naturally very unproductive now supports a great quantity of cattle and sheep, and also bears good crops of corn after having been some years in grass.

There is a great portion of the stiff heavy lands in Cambridgeshire, independently of the fens, which would be greatly benefited by judicious surface-draining. By this means, many soils now too wet to bear turnips, or to allow heavy cattle to be depastured upon them in spring or autumn, would become dry and sound; and the water being carried off by the drains, would not stagnate below the surface and keep the ground in a soft state, equally prejudicial to the growth of all plants not usually found in marshes, and to the cattle and sheep depastured on them. A convertible husbandry might then be introduced, the expenses of cultivation much diminished, and the produce greatly increased.

The fairs in Cambridgeshire are not so numerous as in many other counties. The principal cattle-fairs are in the Isle of Ely. Cambridge fair begins June 24th, and lasts a week. Ely; Holy Thursday, and October 29th. Linton; Holy Thursday, and September 30th. March, Isle of Ely; Monday before Whit-Sunday, and Whit-Monday. Soham; April 28th. Sturbitch fair begins September 18th, and lasts 14 days. It was once one of the greatest trading fairs in England: it is now greatly fallen off. Thorney, Isle of Ely, July 1st, and September 21st. Whittlesey, Isle of Ely, January 25th, June 1st, and October 26th. Wisbeach, Isle of Ely, Wednesday before Whit-Sunday, July 29th.

* The staple of a soil is a valuable quality, on which depends its power of nourishing the roots of plants and conveying to them those particles of which their growth and health depend.

Divisions, towns, &c.—The divisions of Cambridgeshire have undergone little change since the Domesday survey. We subjoin a list of the present hundreds, giving also their situation in the county, and their ancient names.

Wisbeach, Witchford, Ely, occupy the northern half of the county, and correspond to the two ancient hundreds of Ely. Staploe (E.)—Staplehou. Cheveley (E.)—Chavele. Radfield (S.E.)—Radefelle. Chilford (S.E.)—Cilde. Littleford (S.)—Witelesfeld. Triplow (S.)—Tre-Armingsford (S.W.)—Erningford. Stow, or Long (S.W.)—Stou. Papworth (W.)—Papeword. North Stow (central)—Norestou. Chesterton (central)—Cestretone. Wetherly (central)—Wederlai. Flendish (central)—Flamindie, or Flamidine. Staine (central)—Stanes.

The county itself is called in Domesday Greutebrigescire. In that survey the town of Cambridge is taxed as a hundred.

Besides the county town, Cambridge (on the Cam, population in 1831, 20,917), this county has one city, Ely (on the old Ouse, population in 1831, 6,119); and four market towns, Wisbeach (on the Nene, population in 1831, 7,253), March (on the old river Nene, population in 1831, 5,117), Thorney (population in 1831, 2,055), and Linton (on the Linton, a small stream flowing into the Cam, population in 1831, 1,678). Several other places formerly had markets: of these the market at Soham (population, in 1831, 3,667) has been disused about 130 years; that at Whittlesey (population in 1831, 6,019) not more than 50; these seem to have been both held by prescription. For Cambridge, Ely, March, and Wisbeach, we refer to their respective articles. The other towns, with Soham and Whittlesey, we shall notice here.

Newmarket is chiefly in Suffolk, and Royston chiefly in Herts.

Thorney is a small town (in Witchford hundred, 39 miles from Cambridge) on a slight eminence rising out of the midst of the fens. Here was antiently a monastery or hermitage, said to have been founded by Sæwulf, first abbot of Medeshamsted or Peterborough; and here, in the year 870, were a prior and several anchorites. The monastery was called Ancarig, but the spot on which it stood had the name of Thorn-ey, from the thickets with which it abounded. Thorneie propter condensatam dumorum vocata. Gul. Maluesh. *de gestis Pontif.*, in Dugdale's *Monasticon*. In 972, this establishment, which had been destroyed by the Danes, was refounded by Ethelwold, bishop of Winchester, for Benedictine monks. Its revenue, at the time of the Domesday Survey, appears to have arisen from rents, amounting to 52*l.* 15*s.*, and from the profits of some fisheries and meres in Huntingdonshire. William of Malmesbury (quoted above), who lived in the reign of Henry II., speaks enthusiastically of the natural beauty of the situation and of the holiness of the inhabitants: he speaks with rapture of the trees, apple orchards, and vineyards. The abbot was mitred. The revenues, at the suppression, were 508*l.* 12*s.* 5*d.* gross (Speed), or 411*l.* 12*s.* 11*d.* clear (Dugdale). The possessions and site were granted to the then earl of Bedford, whose heir, the present duke of Bedford, is proprietor of the whole parish and lord of the manor. There was also an hospital for poor persons under the government of the abbey.

A part of the conventual church, rebuilt in 1085 and 1125, is yet standing, and serves as the parish church. The part which remains is the nave of the church; the sides have been destroyed, and the arches, five in number, walled up. The west end is a fine specimen of architecture, though in a very mixed style, being flanked by Norman square turrets, crowned with octagonal perpendicular tops; the doorway has deep mouldings and niches; and the whole of this front has an imposing appearance.

Thorney has a small weekly market on Tuesday, chiefly for butcher's meat; and three annual fairs, two of them much frequented for the sale of horses and cattle. Population, in 1831, 2,055, chiefly agricultural. The living is a donative, exempt from episcopal jurisdiction, and in the gift of the duke of Bedford; income, in 1831, 220*l.* There is a school-house, built by an ancestor of the duke of Bedford, who allows the master 20*l.* per annum: the duke also supports ten or twelve poor families in some almshouses, which have no permanent endowment. A colony of French and Walloon refugees were settled here about the middle of the seventeenth century, and employed by the then earl of Bedford in draining the fens. Several of these refugees have tombs in the churchyard, and many of the inhabitants are descended from them.

In Gorton's *Top. Dict.*, mention is made of a literary society established here in 1823, and possessing a good library.

Linton, in Chilford hundred, 11 miles from Cambridge, is a small town pleasantly situated. The houses are principally low and covered with thatch; a few are of brick. There is a small market-house of mean appearance, and a spacious church. There were formerly two religious houses in this parish; one an alien priory, subordinated to the abbey of St. Jacutus de Insula, in Bretagne; the other (at Barham) a priory of Crossed or Crouched friars, a cell to Welnetham, in Suffolk, which was itself subor house of this order in London. The former was suppressed in the time of Henry VI., and its possessions given to the master and fellows of Pembroke Hall, Cambridge. There are some remains of the conventual buildings at Barham incorporated into Barham Hall, a country seat for the master of Pembroke Hall for the time being.

Linton has a weekly market, at which there is a good trade in corn; and two annual fairs, one a great sheep fair. Population, in 1831, 1,678; about one-third of the adult males are engaged in agriculture. The living is a vicarage, in the diocese and archdeaconry of Ely, in the gift of the bishop of Ely; annual value, 204*l.*

Soham is in the hundred of Staploe, 5½ miles from Ely, on the road from that city to Bury St. Edmunds. It is a large, irregular place, with a spacious cross church, having a tower at the west end. St. Felix, the first bishop of the East Angles, is said to have founded a monastery here, and to have placed here (about A.D. 630) the episcopal see, afterwards removed to Dunwich. The monks of this convent were massacred by the Danes in 870, and the bishop's house and the church burnt. Before the draining of the fens, there was a large mere at Soham.

A good deal of cheese is made about Soham similar to the Stilton cheese. The population, in 1831, was 3,667, chiefly agricultural. There is a navigable cut from the river Ouse to Soham. The living is a vicarage (with the curacy of Barway attached), in the archdeaconry of Sudbury and diocese of Norwich. The annual value is 1,642*l.*; it is in the gift of Pembroke Hall, Cambridge. There is a large charity-school and several almshouses, with very small endowments. Although, on the authority of Messrs. Lysons, we have stated that the market is discontinued, some authorities speak of a market now held weekly on Saturday. There is an annual fair.

Whittlesey, in Witchford hundred, is 34 miles from Cambridge. It consists of two parishes (Whittlesey St. Mary and Whittlesey St. Andrew), and has two churches, but the respective bounds of the parishes are not known, and there is only one parochial register. The livings are in distinct patronage, and for some time were commonly held by the same person; at present there is a vicar to each. St. Andrew's church is the largest; St. Mary's church has a very fine tower and spire.

The market has been discontinued about 50 years. The population, in 1831, was 6,019, chiefly agricultural. There is an annual fair.

There are two endowed charity-schools at Whittlesey, and some almshouses, the latter supported by the parish. At Eldernall in the parish is a ruined chapel. Whittlesey Mere is a large piece of water in Huntingdonshire, S.W. of the village. It yields abundance of fish. The livings of St. Mary and St. Andrew are vicarages in the diocese of Ely, exempt from visitation, and in the gift respectively of the earl of Waldegrave and of the crown. (See *Clerical Guide*, London, 1836.) The value of St. Mary is 222*l.*, and that of St. Andrew 62*l.* per annum.

Divisions for Ecclesiastical and Legal Purposes.—The county is, for the most part, in the diocese of Ely. A few parishes, which originally formed part of the diocese of the East Angles, while the rest of Cambridgeshire belonged to Mercia, are in that of Norwich, and one is peculiar of the diocese of Rochester. There are 165 parishes, but some of these are, for ecclesiastical purposes, united, and several have dependent chapelries. Of the 165 parishes 62 are rectories, 81 vicarages, 22 curacies or donatives. Those parishes of the diocese of Ely which are in the hundreds of Ely, Wisbeach, and Witchford are mostly exempt from episcopal jurisdiction; the others are in the archdeaconry of Ely, the only archdeaconry in this see.

The bishop of Ely has considerable civil jurisdiction, and is Custos Regni of the district subject to him, which is

styled *Liberty or Franchise of the bishop of Ely*, or popularly *the Isle of Ely*, and includes the hundreds of Ely, Whisson, and Witchford. The bishop appoints a chief justice, who holds a session of pleas above 40s. under a commission from the bishop, and a session of oyer and terminer and gaol delivery by virtue of a commission from the king; a chief bailiff, who exercises the same functions in the Isle as the sheriff does in a county; a deputy bailiff, two coroners, and subordinate officers. The spring assizes for the Isle, and the April and October sessions are held at Ely; the summer assizes and the other sessions at Wisbech. The inhabitants of the Isle are exempt from paying county rates, and from serving on county juries.

The Isle of the county is in the Norfolk circuit. The quarter-sessions are held at Cambridge. The county returns three members to parliament (one having been added by the Reform Act), the borough of Cambridge two, and the university of Cambridge two. Cambridge is the chief place of county election, and the polling stations are Cambridge, Ely, Newmarket, Royston, Wisbech, and Whittlesey. The number of voters, by the registration of 1836, was 3683, exclusive of the Isle of Ely, which has 3027; total 6710.

History and Antiquities.—In the most remote period of British history Cambridgeshire appears to have been inhabited by the Iceni, a powerful nation, whose territory comprehended also the counties of Norfolk and Suffolk, but Cambridgeshire does not appear to have been the scene of any remarkable event in their history. In the Roman division of the island this county was included in Flavia Cæsariensis.

Several British and Roman roads crossed this county. Ikeneld and Ermine Streets are supposed to be British. Ikeneld or Iekniel Street crosses the county from the neighbourhood of Newmarket to the neighbourhood of Royston. For a considerable part of this distance it runs parallel to the road from Newmarket to London and a little to the left of it. Just before it reaches the border of Essex it bends to the right and runs W., just within the boundary of the county, to Royston; from whence it gradually turns to the S.W. and runs towards Baldock (Herts). This ancient road has been in some parts so far obliterated by the plough as not to be easily traceable, in other parts the marks of its course are evident. Ermine Street entered the county at Royston, and ran to the left of the present turnpike-road to Caxton and Godmanchester near Huntingdon. A Roman road in the same direction kept nearly in the line of the present turnpike-road. The great Roman road (Via Devana) which connected the colonies of Camulodunum (Colchester or Maldon) and Deva (Chester) passed through Cambridgeshire, entering the county from Withersfield, near Haverhill in Suffolk, and proceeding with little deviation from a straight line to Cambridge, where it is supposed the Romans had a bridge, and from thence nearly in the line of the present turnpike-road to Godmanchester near Huntingdon. Another road entering near Littleport crossed the county through the fens near Ely to Cambridge, and from thence towards Sandy or Salndy, in Bedfordshire, and Fenny Stratford, in Bucks. Another road may be imperfectly traced running near Newmarket and Soham through the fens to Ely; and Sir W. Dugdale mentions one across the fens from the neighbourhood of Downham (Norfolk) to Whittlesey and Peterborough (Northamptonshire); and it has been conjectured that a branch from this led by Elme and Wisbech into Lincolnshire. Cambridge is considered to have been a Roman station, probably the *Camboricum* of the Itineraries, called by Richard of Cirencester a colony, though the distances given in the Itineraries of Antoninus and Richard do by no means suit, but these have been probably corrupted. Roman antiquities of various kinds have been discovered at Cambridge, Soham, Elme, near Wisbech, and other places.

The circular camp of Vandlebury on the Gogmagog Hills, Arbury in the parish of Chesterton near Cambridge, Willingham on the edge of the fen, and the earth-works round the sites of Bourn and Camps Castles, are probably of British origin. There is a considerable round mound near Cambridge Castle, like Silbury hill, but less; the ditches round it may be Roman. Vandlebury, from Roman remains found there, appears to have been afterwards occupied by the Romans; and Willingham was occupied and strengthened with new works by William the Conqueror when he besieged the Isle of Ely. There are

the remains of a Roman camp at Great Shelford near Cambridge; and a Roman embankment, connected with the works for draining the fens, extends some miles from Elme to Tyd St. Giles near Wisbech.

There are some very remarkable ancient ditches in this county: as the Devil's Ditch near Newmarket, running N.W. and S.E. for about four or five miles, and crossing the London Road; Fleamydyke, running parallel to it at a distance of six miles; a third near Bourn Bridge, far from Linton; and a fourth (slight work) near Littleport, nearly in the same direction as the first two. The Devil's Ditch, the largest probably, and the most potent, consists of a deep ditch and an elevated vallum, having a slope of 52 feet on the S.W. side, where the ditch is, and 26 feet on the N.E. side; the whole of the works are about 100 feet in breadth.

In the wars between the Saxons and Danes this county suffered severely. About A.D. 870 Cambridge was burnt by the Danish invaders; the monasteries of Ely, Soham, and Thorney were destroyed, and their inmates slaughtered. The first attack of the barbarians on the Isle of Ely was repulsed, but the second was successful; many of the Saxon nobles who had taken refuge there with their effects became the prey of the invaders. In 875, in the reign of Alfred, the larger portion of the Danish army was posted at Cambridge, which had been rebuilt. In 921 an army formed of those Danes settled in East Anglia by Alfred, surrendered at Cambridge to Edward the Elder. In 1010 Cambridge was again burnt by the Danes, who were ravaging the country under their king Svein.

When William the Conqueror invaded England, the most obstinate resistance which he experienced was in the Isle of Ely. Hereward le Wake, son of Leofric, lord of Brumme (Bourne?) in Lincolnshire, had been banished in early life for his violent temper, and having signalized his valour in foreign parts, was in Flanders when the battle of Hastings was fought in 1066. Hearing that his paternal inheritance had been given to a Norman, and his mother ill used, he returned to England, and commenced hostilities against the usurpers of his patrimony. The Isle of Ely was his central station, and he built on it a wooden castle which long retained his name. William surrounded the island with his fleet and army, attempting to make a passage through the fens by solid roads in some parts and bridges in others; and either awed by the superstition of the times, or wishing to make it subservient to his interests, he got a witch to march at the head of his army and try the effect of her incantations against Hereward. The Anglo-Saxon, no way daunted, set fire to the reeds and other vegetation of the fens, and the witch and the troops who followed her perished in the flames. The actions of Hereward became the theme of popular songs, and the Conqueror's own secretary, Ingulphus, has penned his eulogium. During his warfare against the Normans his camp was the refuge of the friends of Saxon independence: Morecar earl of Northumbria, Sægar archbishop of Canterbury, Ellgwin bishop of Durham, and others, repaired to him. The defence of the Isle lasted till 1074, and the Conqueror penetrated at last only by virtue of a compact with the monks of Ely, whose lands beyond the island he had seized. Hereward, unsubdued, contrived to make his peace with the king, obtained the restoration of his inheritance, and died quietly in his bed.

In the civil wars of Stephen and the Empress Maud, the bishop of Ely, who supported the latter, built a wooden castle at Ely, and fortified the castle of Aldreth (in Haddenham parish), which appears to have commanded one of the approaches to the Isle. The king attacked the Isle and took the castle of Aldreth, but it was afterwards retaken (about the year 1142) by the bishop. The Isle afterwards suffered much from the ravages of war, and from famine and pestilence, the consequence of these hostilities. In the civil war between John and his barons the Isle was twice ravaged by the king's troops, first under Walter de Buuck, and afterwards under Fulk de Brent (the king's favourite, who had been appointed governor of Cambridge Castle) and his confederates. This was about the year 1216. About the same time the barons took Cambridge Castle, and the king marching into Cambridgeshire did, as Holinshed expresses it, 'hurt enough' but on the king's retreat the barons recovered the Isle of Ely except one castle, probably at Ely. In the troubles which marked the close of the reign of Henry III. the Isle was again the scene of contest. It was taken and fortified by the barons, who ravaged

the county and took and plundered Cambridge. The Isle was retaken by the king's son, afterwards Edward I., in 1266 and following years.

In the civil war of Charles I. the county of Cambridge was one of those associated for the support of the parliament: the king had no visible party in it, and not one fixed post. The University was indeed loyal, and the heads of it voted their plate to be melted down for the king's use. In 1643 Cromwell took possession of Cambridge, and the earl of Manchester being sent down, expelled the most eminent loyalists from the University: in 1645 Cromwell was again sent to secure the Isle of Ely. When the king was seized by Cornet Joyce in 1647 the parliamentary army was at Kennet, in this county, near Newmarket; but the king was conveyed by Cromwell's order to Childerley, near Cambridge, where Cromwell and Fairfax visited him. On the 9th of June in the same year the king was removed to Newmarket.

Of baronial castles this county has scarcely any remains: there is a gateway of Cambridge Castle, and there are some remains of a castle in Cheveley park and at Burwell, both near Newmarket; and earthworks, marking the site of castles, at Ely, Bourn (between Cambridge and Pottun in Bedfordshire), and Castle Camps, near Linton. Some old entrenchments at Swavesey near St. Ives, called the Castle, are probably the remains of a mansion-house. Of Wisbeach Castle and Bassingbourn Castle, near Royston, there are no remains.

At Downham in the Isle of Ely are some remains of an ancient palace of the bishops of Ely, and there are some old manor-houses, or remains of manor-houses, in different places.

The principal monastic establishments in the county, besides those at and near Cambridge, Ely, and Thorney (for which see those articles, or the former parts of the present article), were Anglesey Priory of Austin canons at Bottisham, between Cambridge and Newmarket (annual value, 149l. 18s. 6d. gross; 124l. 19s. clear); Denny Abbey, on the edge of the fens for Nuns Minoreesses (annual value, 218l. 0s. 1d. gross; 172l. 8s. 3d. clear); and Shengay, a house of the Knights Hospitallers at Wendy, near Thorney (annual value, 175l. 4s. 6d. gross; 171l. 4s. 6d. clear). Of these there are few remains; none that call for notice.

Of ancient ecclesiastical edifices the most striking are at Cambridge and Ely, and Thorney and Whittlesford. There are various others, parts of which will attract the attention of the student of Gothic architecture.

Magna Britannia; Beauties of England and Wales; Conybeare and Phillips's Geology of England and Wales; Arrowsmith's Map; and Greenough's Geological Map of England and Wales; Turner's and Mackintosh's Histories of England; Thierry, Hist. de la Conquête de l'Angleterre par les Normands; Rickman on Gothic Architecture, &c.)

Statistics.—Population. Cambridgeshire is almost entirely an agricultural county, ranking the sixth in that respect in England. Of 35,715 males 20 years of age and upwards residing within the county in 1831, it was found that 19,385 were engaged in agricultural pursuits, and only 39 were employed in manufactures or in making machinery.

The following summary of the population as it existed in May, 1831, shows the number of inhabitants and their occupations in each hundred of the county.

HUNDREDS, &c.	HOUSES.				OCCUPATIONS.				PERSONS.			Males, twenty years of age.
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicrafts.	All other families not comprised in the two preceding classes.		Males.	Females.	Total of Persons.	
Armingford . . .	1,359	1,585	8	22	1,038	345	202		3,817	3,722	7,539	1,662

The population of Cambridgeshire at each of the enumerations made in this century was:—

	Males.	Females.	Total.	Inc. per Cent.
1801 . . .	44,081	42,265	86,346	
1811 . . .	50,756	50,353	101,109	13.6
1821 . . .	60,301	61,608	121,909	20.56
1831 . . .	72,031	71,924	143,955	18.04

Showing an increase between the first and last periods of 57,609 persons, or more than 66 per cent., which is 9 per cent. beyond the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the three periods of

1811 were £ 85,884, which was 6s. 2d. for each inhabitant.	
1821 " 87,872 " 14s. 5d. " "	
1831 " 98,000 " 13s. 8d. " "	

The expenditure for the same purpose in the year ending 25th March, 1834, was 96,497l.; and assuming that the population has increased at the same rate of percentage as during the ten preceding years, the above gives an average of 12s. 7d. for each inhabitant. All the averages are above those for the whole of England and Wales.

The sum raised in this county for poor, county rate, and other local purposes, in the year ending 25th March, 1833, was 119,817l. 1s., and was levied upon the various descriptions of property as follows:—

On land . . .	£95,397	5
Dwelling-houses . . .	22,760	9
Mills, factories, &c. . .	1,233	5
Manorial profits, navigation, &c. . .	426	2

£119,817. 1

The amount expended was	£.	s.	d.
For the relief of the poor	101,331	12	
In suits for removal of pauper	2,646	18	
For other purposes	10,071	7	
	£ 120,049	17	

The descriptions of property assessed for local purposes are not distinguished in the returns made up for the year ending March, 1834. The total amount levied in that year was 122,768 7s., and the expenditure was as follows:—

For the relief of the poor	96,497
In suits of law, removal of paupers, &c.	3,427
For other purposes	18,662

Total £ 118,586 4

A saving of expense has therefore been effected for 1834 in the sums expended for the relief of the poor of 4½ per cent. The other items are, however, beyond those of the preceding year, and the whole amount of saving is therefore reduced to less than 1½ per cent.

The number of turnpike trusts in Cambridgeshire, as ascertained in 1829, was 15; the number of miles of roads under their charge was 278; the annual income arising from the tolls and parish composition was 17,341½; the annual expenditure 14,754½.

The county expenditure for various purposes, exclusive of the relief of the poor, was as follows in 1833:—

Bridges and roads leading to them	£.	s.	d.
Gaols	0	15	0
Expenses of criminal trials at quarter-sessions	—		
circuits	658	14	11
of coroners	67	3	6
of militia	11	4	8
of county elections	236	8	2
of shire halls	15	13	0
incidental	3600	17	0

The sum levied for county rate in 1833 was 3887½ 9s.

The number of persons charged with criminal offences in Cambridgeshire, in the three septennial periods ending with 1820, 1827, and 1834, were 553, 964, and 1206 respectively, making an average of 79 annually in the first period, of 138 in the second, and of 172 in the last period.

The number of persons tried at quarter-sessions in each of the years 1831, 1832, and 1833, in respect to which any costs were paid out of the county rates, was 44, 40, and 45, respectively: of these were committed for—

	1831.	1832.	1833.
Felonies	36	31	40
Misdemeanors	8	9	5
	44	40	45

The total number of committals in each of the same years was 51, 59, and 47: of whom

The number convicted was	33	39	30
acquired	13	14	11
Discharged by proclamation	5	6	6

59 47

At the assizes and sessions in 1835, there were 211 persons in this county charged with crimes; out of which number 24 were tried for offences against the person (15 of which were common assaults); 21 for offences against property committed with violence; and 157 for offences against property committed without violence: of the 9 remaining, 5 were committed for riot, 1 for arson, 1 for maiming cattle, 1 for uttering counterfeit coin, and 1 for taking fish in inclosed waters. Of those committed, 156 were convicted, and 55 were sentenced, or no bills found against them. Most of the punishments of the convicted were very slight: 19 were sentenced to imprisonment for periods from 6 months to 1 year; 26 months or under; 3 were fined and 1 was discharged on his own ties. Of the remaining 54, nine were sentenced to death, which sentences were commuted to transportation or imprisonment; the rest of the offenders, 45, were sentenced to transportation for various periods.

Of the offenders 194 were males and 17 females.

Of these 70 could read and write, 49 could read only, 41 could neither read nor write, and the degree of instruction of 1 could not be ascertained. The proportion of the offenders to the population in 1835 was 1 in 682.

Cambridgeshire has two savings-banks; the number of depositors and amount of deposits on the 20th of November, 1832, 1833, and 1834 respectively were:—

	1832.	1833.	1834.
Number of depositors	1681	1725	1953
Amount of deposits	£62,839	63,076	66,225

The various sums placed in the savings-banks in 1834 classed as under:—

£	Depositors.	Deposits
Not exceeding 20	864	6913
" 50	649	17,046
" 100	275	18,836
" 150	93	10,788
" 200	61	10,365
Above . . 200	11	2,777

1,953 66,225

Education.—The following abstract is taken from the parliamentary inquiry on education made in the session of 1835:—

Infant Schools 21
Number of infants at such schools, ages from 4 to 7 years:—

Males	254
Females	260
Sex not specified	190

704

Daily Schools 550

Number of children at such Schools, ages from 4 to 15 or 16 years:—

Males	6094
Females	5688
Sex not specified	2783

Schools 571 14,565

Total of children under daily instruction

Sunday Schools 194

Number of children at such Schools, ages from 4 to 15 or 16 years:—

Males	5204
Females	5234
Sex not specified	3613

14,051

Taking the summary of ages obtained at the enumeration of the population in 1821* as the basis of an approximation, and making allowance for the increase of population at the same rate as in the 10 years preceding 1831, we may assume as being near the truth, that there are at present living in Cambridgeshire 46,966 persons between the ages of 2 and 15, and we may fairly conclude that very few more than half the children, certainly not two-thirds, between the ages of 2 and 15 in the county receive instruction; since a very large number of the scholars attend both daily and Sunday schools. Fifteen schools are both daily and Sunday schools, containing 1247 scholars, and there are many others besides, in which the weekly scholars attend the Sunday schools also.

Maintenance of Schools.

Description of schools.	By endowment.			By subscription and payment from scholars.
	Schls.	Scholars.	Sch.	
Infant School	1	31	2	132
Daily Schools	64	2552	32	1668
Sunday Schools	11	624	180	150
Total...	76	3207	214	1950

The schools established by Dissenters, included in the above, are:—

	Schools.	Scholars.
Infant Schools	1	53
Daily Schools	7	290
Sunday Schools	52	343

The schools established since the year 1818 are:—
Infant and other daily schools 245 containing 6153 scholars.
Sunday Schools 10,394

Thirty-seven boarding schools are included in the number of daily schools in Cambridgeshire.

* The ages of only 901 and per cent. of the population of Cambridgeshire were then ascertained.

No school in this county appears to be confined to the children of parents of the established church, or of any other particular religious denomination, such exclusion being disclaimed in almost every instance, especially in schools established by dissenters, among whom are here included Wesleyan Methodists.

Lending libraries of books are attached to 21 schools in Cambridgeshire.

CAMBUSLANG. [LANARKSHIRE.]

CAMBUSNETHAN. [LANARKSHIRE.]

CAMBYSES (Καμβύσης), the second king of the Medes and Persians, succeeded his father Cyrus B.C. 529. He led an army against Egypt (B.C. 525), defeated the Egyptian king Psammetichus in a great battle, and reduced Egypt to the form of a Persian province. The ruin of many of the monuments of Egypt is attributed, and perhaps to a certain extent correctly, to the fury of the barbarian invaders and of their king, who was mad. From Egypt Cambyses marched southwards against the Macrobian Ethiopians (a people whose geographical position is not certain), but his army, after suffering severely in the deserts, and being compelled to eat one another, returned to Thebes with much diminished numbers. A detachment of the Persian army which was sent from Thebes against the Ammonites (Sivah) was lost in the desert. After committing numberless extravagancies in Egypt, putting his brother Smerdis to death, marrying his sister, which was contrary to the Persian custom, and then killing her by a kick during her pregnancy, Cambyses died (B.C. 521) in an accidental wound from his own sword at Ecbatana, a town of Syria (not Ecbatana the capital of Media). Ctesias says that Cambyses died at Babylon.

Compare with Herodotus (iii.), which is the authority for what is here stated, the account of Ctesias, *Persica*.

CAMDEN, a post town of Kershaw county, in the State of South Carolina, situated on the east side of the Wateree River, in 34° 20' N. lat., and 80° 42' W. long., about 30 miles N.E. of Columbia, and 110 miles N. by W. of Charleston, in the same State. The town, which is regularly laid out, is favourably situated for trade with the interior. The Wateree is navigable up to Camden for boats of 70 tons.

The immediate neighbourhood of this town was the scene of two battles in the war of American Independence. The first was fought on the 16th of August, 1780, between Lord Cornwallis and General Gates, which terminated in favour of the English. The second engagement occurred in the month of April following, when Lord Rawdon sallied from the town and attacked the camp of the Americans under General Greene. The English general was not on this occasion successful, and the town was evacuated on the 9th of May following.

CAMDEN, one of the most illustrious names in the whole catalogue of learned Englishmen. His father was a painter-stainer, living in the Old Bailey, where Camden was born on the 22nd of May, 1551. It is supposed that his father died when he was but a child leaving little provision for him. It is certain that he was admitted into Christ's Hospital within a very few years after its establishment. He was afterwards in St. Paul's School, and finally removed to Oxford, where he appears to have studied in more than one college. He left the university in 1571, and became an under-master of Westminster School, the duties of which situation he discharged at the time when he composed the works which have made his name so eminent.

The most celebrated of these is that entitled '*Britannia*,' a survey of the British isles, written in elegant Latin. The first edition of this work was published in 1586. Many others appeared in his life-time with enlargements. A singular fate has attended this book. A long succession of writers have made additions to it, till Camden's '*Britannia*,' which as it came forth from him was but a single volume of no large dimensions, has been swelled out in the successive English editions till at length it has become four folio volumes, though the work is still called by his name. One effect of this has been to throw the original work into the shade, and to occasion a wrong apprehension to prevail concerning it, as if it had been composed for the use of the inhabitants of Britain rather than for the information of learned foreigners, and as if it were not that succinct and perfect composition which does so much honour to the taste and judgment as well as to the learning of the author.

The English editions have the value as containing what is at present the best general description of the British isles. But the matter is ill-digested, and the great work of an

English Britannia, such as it ought to be, remains to be performed. Bishop Gibson and Mr. Gough were the compilers and editors of the principal English editions.

Camden began now to be looked upon as one of the most distinguished scholars of his age. He began to have an extensive correspondence with the learned both at home and abroad, much of which has been preserved and published. The prebend of Ilfracombe was given to him, though a layman. He was made head master of Westminster School in 1592, and Clarendon King of Arms in 1597, without having passed through the inferior offices of herald or pursuivant. This was distasteful to the old officers of the College of Arms, and led to what must have been to him harassing dissensions.

The remainder of his history is to be found in a catalogue of his writings. We shall touch upon them briefly. His *Annals of the reign of Elizabeth* is the next in celebrity to his *Britannia*, an admirable digest of the events of that reign, delivered in pure and elegant Latinity. He intended a similar work on the reign of James, but of this only the heads were prepared. His folio volume of the works of some of our old Latin chroniclers was printed at Frankfurt in 1603. It belongs to the set of Latin chroniclers on English affairs, and contains Asser, Walsingham, Girardus Cambrensis, and others. Among his minor works two only need be mentioned, his '*Remains concerning Britain*,' published in 1604, a very amusing and instructive volume; and a small Greek grammar for the use of Westminster School, which was first published in 1597.

Camden reached the age of seventy-two. He died on the 9th November, 1623, at Chiselhurst in Kent, and was interred in Westminster Abbey, a great assemblage of the learned and illustrious doing him honour at his funeral. A monument was erected to his memory which still remains. It has his bust with the left hand resting on the '*Britannia*.'

He never married, and at his death left a good estate, the greater part of which he devoted, a little before his death, to founding an historical lecture in the University of Oxford, now called the Camden Professorship of History.

CAMDEN, CHARLES PRATT, EARL OF, was a younger son of Sir John Pratt, who was successively a puisne judge of the court of King's Bench and chief justice of that court, in the reign of George I. He was descended from a family of consideration in Devonshire, of which county Chief Justice Pratt, his father, was a native. Charles Pratt was born in the year 1714. He went at an early age to Eton; and in 1731, having obtained the election to King's College, Cambridge, he removed to the university. He became a fellow, according to the usual routine, in 1734; in the summer of 1738 he was called to the bar, and in the following year took his master's degree. He made his first entrance into the profession in the courts of common law, and travelled the western circuit for several years with little or no practice. Conceiving his prospects of success in the profession of the law to be hopeless, he at one time resolved to abandon it and seek his fortune in the church. Henley, afterwards Lord Chancellor Northampton, who was at that time in considerable practice on the western circuit, is said to have dissuaded him from the execution of this purpose, and to have induced him to continue in his course until his turn for business and advancement should arrive. He had the good sense to follow this judicious advice, and shortly afterwards his business began to increase. His practice as a junior, however, appears never to have been considerable. His name appears occasionally in the reports of cases of parochial settlement from the western circuit; and in 1752 we find him employed as one of the counsel in defence of Owen, the bookseller, who had been prosecuted by the attorney-general for publishing a libel upon the House of Commons (Howell's *State Trials*, vol. xviii. p. 1203). In the following year he also appeared as counsel for the prisoner in the trial of Timothy Murphy for forging a will, a case which excited much attention at the time (Howell's *State Trials*, vol. xix. p. 693). But previously to his appointment as attorney-general, he had much less general practice in the courts of Westminster-hall than several advocates whom at a subsequent period of his life he left far behind him in professional advancement. In the course of the change of administration which took place in June, 1757, Sir Robert Henley, the early friend and adviser of Pratt, was promoted from the office of attorney-general to that of lord keeper; and upon occasion of this vacancy,

Lord Camden, who had been a contemporary with Pratt at Eton, and enjoyed great confidence in him, insisted upon his being made attorney-general; and he was immediately afterwards returned to parliament as representative of the now abolished borough of Downton, in Wiltshire. During the four years that he continued to be a member of the House of Commons he did not take any very active or distinguished part in the debates.

His professional business while he was attorney-general was very extensive, particularly in the court of chancery. His judicial conduct as attorney-general appears to have been uniformly judicious and moderate. The only ex-officio information for libel filed by him was instituted against Dr. Stoughton for his 'Letter to the People of England,' of which Horne Tooke says (Howell's *State Trials*, vol. xx. p. 708) 'that if ever there was an infamous libel against government surely it was that.' In his speech upon the trial of this information, Pratt declared that 'he did not wish for the conviction of the defendant if any man in the world could entertain a doubt of his guilt.' His language and demeanour, as the official advocates for the prosecution on the trials of Dr. Henney for treason, and Earl Ferrers for murder, were fair and temperate; he contented himself with a simple statement of the facts, without attempting to inflame or aggravate the charge. It may be observed, however, that in this respect he only followed the example of his immediate predecessors; moderation and self-restraint in the conduct of government prosecutions had been conscientiously observed by the crown advocates,—by Somers, Yorke, and Murray, ever since the revolution; and it was chiefly at a period previous to that event, and subsequently to Lord Camden's time, that a practice prevailed less consistent with humanity and good taste.

The death of Chief Justice Willes, at the close of 1761, caused a vacancy on the bench of the common pleas; and this being one of those judicial offices of which by long usage the attorney-general for the time being is considered to have the refusal, it was accordingly offered to Pratt, and accepted by him. Soon after his elevation to the bench the great question respecting the legality of general warrants was raised, by the proceedings of government with relation to the celebrated John Wilkes. Lord Chief Justice Pratt expressed his opinion against the asserted power of the secretary of state to authorize arrests, or the seizure of papers upon general warrants, with a greater degree of warmth than was usual, or perhaps justifiable, in pronouncing a mere judicial decision; but his energy on this occasion was entirely in accordance with the prevailing feeling of the times, and produced for him a larger share of popular favour than had been possessed by any judge in England since the revolution. Addresses of thanks were voted to him by many of the principal towns, and several public bodies presented him with the freedom of their respective corporations. The city of London, in particular, placed his portrait in Guildhall, with an inscription in honour of the 'maintainer of English constitutional liberty.'

When the Rockingham administration came into power, in the summer of 1765, Lord Chief Justice Pratt was raised to the peerage by the title of Baron Camden, of Camden Place, in the county of Kent. He did not however by any means become an adherent of that ministry; on the contrary, he made a vigorous opposition to one of the first measures introduced by them in the ensuing parliament, namely, the resolution asserting the right of Great Britain to impose laws upon the American colonies in all cases whatsoever; by which resolution, and an act to be founded upon it, the government proposed to qualify the repeal of the obnoxious stamp act of the previous session. He also gave his decided opposition to the declaratory act to the same effect as the resolutions which afterwards accompanied the repeal of the stamp act.

When Lord Rockingham's ephemeral administration broke up in July, 1766, Lord Northampton, being removed from the court of chancery, became president of the council; and upon the occurrence of this vacancy, the seals were given to Lord Camden.

The duke of Grafton's administration, composed as it was of the most heterogeneous materials, so 'chequered and speckled,—a piece of joinery so grossly indented and whimsically dove-tailed,' as Burke described it, contained within itself the elements of its dissolution; and its fall was accelerated by the proceedings of the House of Commons relating to John Wilkes, and the measures respecting America, both

of which had excited a violent fermentation in the public mind. Upon the opening of the session of 1770, Lord Camden declared in the House of Lords his opposition to government, and actually voted for Lord Chatham's amendment to the ministerial address. Such a declaration by the lord chancellor, accompanied by an unequivocal act of hostility to the government, necessarily led to his removal from the woolsack.

Lord Camden's character as a presiding judge in the court of chancery is thus described by a contemporary writer:— 'He was blessed by nature with a clear, persuasive, and satisfactory manner of conveying his ideas. In the midst of politeness and facility, he kept up the true dignity of his important office: in the midst of exemplary patience (foreign to his natural temper, and therefore the more commendable), his understanding was always vigilant. His memory was prodigious in readiness and comprehension; but above all, there appeared a kind of benevolent solicitude for the discovery of truth that won the assents to a thorough and implicit confidence in him. He was apt on the other hand to be a little too prolix in the reason of his decrees, by taking notice even of inferior circumstances, and viewing the question in every conceivable light. This however was an error on the right side, and arose from his wish to satisfy the bar and his own mind, which was (perhaps to a weakness) dissatisfied with its first impressions however strong. He had other faults that have met with severe and deserved censure: he wore a tie-wig in court, and has been frequently observed to garter up his stockings while the counsel were the most strenuous in their eloquence.' (Almon's *Anecdotes*, vol. i. p. 384.)

With the surrender of the seals, in 1770, Lord Camden's judicial career finally closed; and during the remaining twenty-four years of his life he was entirely a political character. His general parliamentary conduct during the remarkable session of 1770, consisted in a strenuous opposition to the policy of Lord North's administration; and Lord Mansfield was on most occasions his personal antagonist. The doctrine asserted by Lord Mansfield on the trials of Woodfall and Miller, that the jury, in cases of libel, were to decide upon the fact of publication only (a question which was not finally determined until the passing of Mr. Fox's libel act, in 1792), was warmly reprobated by Lord Camden in the House of Lords; and upon this and upon other occasions he indulged in a degree of personal bitterness towards the chief justice which is variously accounted for by contemporary writers, but which certainly derogates from the dignity and general merit of Lord Camden's character. Lord Camden also uniformly opposed the ill-advised policy of Lord North respecting America; and in 1778 he signed, and is said to have framed the protest of the Lords against the rejection of Lord Rockingham's motion for an address to the king, praying him to disavow the obnoxious manifesto of the American commissioners. On the recall of Lord Rockingham and the Whigs to power in 1782, Lord Camden was appointed president of the council; but was displaced upon the formation of the Coalition-ministry in 1783. To this administration he placed himself in zealous opposition; and in the debate on Mr. Fox's India bill in the House of Lords, he distinguished himself by an able and eloquent speech against the measure. The fate of this bill put an end to the short existence of the Coalition-ministry; and soon after the formation of Mr. Pitt's administration, Lord Camden was reinstated in the office of president of the council, which he continued to hold during the remainder of his life. Though now upwards of 70 years of age, and though his health was considerably impaired by repeated attacks of gout, he continued his attendance in the House of Lords, and actively assisted in the several debates upon the Indian Judicature Bill, the Wine Excise Bill, and several other important measures which were introduced during the early part of Mr. Pitt's administration; and upon the occasion of the king's derangement in 1788, he introduced the plan proposed by government for the establishment of a regency. In 1786 he was created Earl Camden, and received the additional title of Viscount Bayham, of Bayham Abbey, in the county of Kent. The last occasion upon which he took a part in the debates was upon the discussion of Mr. Fox's celebrated Libel Act, in 1792. The question of the province of juries in cases of libel was one which during the whole of his life had deeply interested him: in his defence of Owen, in 1752, he had warmly asserted the popular doctrine upon this subject; and on the introduction of this bill into the

House of Lords he particularly distinguished himself by the animation and eloquence with which, in advanced age, he maintained the principle which in his early years he had often zealously espoused.

Lord Camden died on the 13th of April, 1794, in the 80th year of his age. It is remarkable that until very lately no connected biography of a man so distinguished as a statesman and judge should have been published. Some remarks on his political and judicial character may be found in Almon's *Anecdotes of Eminent Persons*, vol. i.; and an extremely well-written life of him is contained in the *Law Magazine* for February, 1818.

CAMEL, a genus of ruminants without horns, *Camel* of the Hebrews, *Djamel* of the Arabs, *κάμηλος* (camelus) of the Greeks, *Camelus* of the Romans, *Cammello* of the Italians, *El Camello* of the Spaniards, *Kameel* of the Germans, and *Chameau* of the French.

Teeth, &c., thirty-four. Sixteen in the upper jaw; viz., two incisors—for the camels and the llamas have these, and form the exceptions, the other ruminants being without any incisors in the upper jaw—two canines, twelve molars. Eighteen in the lower jaw; viz., six incisors, two canines, ten molars. The incisors of the upper jaw bear a close resemblance to canine teeth, for they are conical, compressed at the sides, pointed, and somewhat curved or hooked. There is another difference between the camels and the other ruminants: the former have the scaphoid and cuboid bones of the tarsus separated. Instead of the great horny case or shoe, which envelops all the lower part of each toe and determines the figure of the ordinary cloven hoof, the camels have only a small one, or rather the rudiment of one, adhering only to the last joint of the toe, and symmetrical in form, like the hoofs of the *Pachydermata*. These and other peculiarities of form lead to the opinion that the camels and the llamas form the link between the *Ruminants* and *Pachydermata* (thick-skinned animals).

General osteology. For this we must refer the reader to Dr. Walter Adam's paper on the osteological symmetry of the Bactrian camel in the 'Transactions of the Linnean Society of London,' vol. xvi. p. 525.

The generic characters may be thus summed up:

Lower incisors in the form of cutting wedges; upper incisors sub-lateral; canines conical, sub-erect, strong; false molars situated in the interdental space on either side.

Head long; upper lip cleft; nostrils slit obliquely; eyes prominent; ears small. Neck elongated. Back with fleshy bosses or hunches; tail moderate. Toes united below. Testes ventral, four in number. Hair inclining to woolly. Callosities on the breast, and flexible points of the extremities.

The upper lip of the camel swollen and divided, the projecting orbits of its eyes, the lengthened and certainly not graceful neck, the back bossed with a hump or humps, and croup comparatively weak, supported upon the long and awkward-looking legs terminating in apparently disproportioned feet, are not materials for producing elegance of form; and indeed the air of the animal is altogether grotesque; but this uncouth shape is, as we shall presently see, one of those admirable examples of contrivance which must strike the most casual observer.

The two species of camel were well known to Aristotle, who, in his 'Natural History' (ii. 1), mentions both the Arabian and the Bactrian, remarking that the latter has two humps, whereas the former has but one. That accurate observer was well aware that, though the camel is retromingent, it is not retrocopulant (ii. 1, v. 2). In the chapter last quoted, he describes the union with the female with the greatest accuracy; and modern observations concur entirely with his account. Pliny, on the contrary (*Hist. x. 63*), with his usual attachment to the marvellous, repeats the common error, notwithstanding: 'Coitus aversus elephantis, camelis, tigribus, lyneibus, rhinocerotis, leoni, dasypodi, cuniculis, quibus aversa genitalia.' In the rutting season a fetid humour is said to distil from their heads, and the male, who is very violent at such seasons, protrudes, with a singular noise, a portion of the *velum palati*. From the passage in Pliny (*Hist. viii. 51*), 'De subus,' it would appear that it was not unusual to castrate the females, 'Castrantur feminae quoque sic uti cameli.' Camus refers also to *Ælian* (*De Nat. Anim.*, iv. 55).

Organization, and its adaptation to the habits of the animal. The problem being proposed to construct an ani-

mated machine that should be best calculated to meet the exigencies of the animal, where could we find a better solution of it than in the construction of the camel? The pads or sole-cushions of the spreading feet are divided into two toes without being externally separated, which buoy up, as it were, the whole bulk with their expansive elasticity from sinking in the sand, on which it advances with silent step—the nostrils so formed that the animal can close them at will to exclude the drift sand of the parching simoom—the powerful upper incisor teeth for resisting in the division of the tough prickly shrubs and dry stunted herbage of the desert—and, above all, the cellular structure of the stomach, which is capable of being converted into an assemblage of water tanks, bear ample testimony to the care manifested in the structure of this extraordinary quadruped.

The stomach of the camel has been well described by Sir Everard Home; and, as this organ is of such peculiar importance to the animal, we proceed to give his description.

The camel's stomach, anteriorly, forms one large bag, but when laid open this is found to be divided into two compartments, on its posterior part, by a strong ridge, which passes down from the right side of the orifice of the œsophagus, in a longitudinal direction. This ridge forms one side of a groove that leads to the orifice of the second cavity, and is continued on beyond that part, becoming one boundary to the cellular structure met with in that situation. From this ridge eight strong muscular bands go off at right angles, and afterwards form curved lines, till they are insensibly lost in the coats of the stomach. These are at equal distances from each other, and, being intersected in a regular way by transverse muscular septa, form the cells. This cellular structure is in the left compartment of the first cavity, and there is another of a more superficial kind on the right; placed in exactly the opposite direction, made up of twenty-one rows of smaller cells, but entirely unconnected with the great ridge. On the left side of the termination of the œsophagus, a broad muscular band has its origin from the coats of the first cavity, and passes down in the form of a fold parallel to the great ridge, till it enters the orifice of the second, where it takes another direction. It is continued along the upper edge of that cavity, and terminates within the orifice of a small bag, which may be termed the third cavity. This band on one side and the great ridge on the other form a canal, which leads from the œsophagus down to the cellular structure in the lower part of the first cavity. The orifice of the second cavity, when this muscle is not in action, is nearly shut; it is at right angles to the side of the first. The second cavity forms a pendulous bag, in which there are twelve rows of cells, formed by as many strong muscular bands, passing in a transverse direction, and intersected by weaker muscular bands, so as to form the orifices of the cells. Above these cells, between them and the muscle which passes along the upper part of this cavity, is a smooth surface, extending from the orifice of this cavity to the termination in the third.

From this account it is evident that the second cavity neither receives the solid food in the first instance, as in the bullock, nor does the food afterwards pass into the cavity or cellular structure. The food first passes into the first compartment of the first cavity, and that portion of it which lies in the recess, immediately below the entrance of the œsophagus, under which the cells are situated, is kept moist, and is readily returned into the mouth along the groove formed for that purpose, by the action of the strong muscle which surrounds this part of the stomach, so that the cellular portion of the first cavity in the camel performs the same office as the second in the ruminants with horns. While the camel is drinking, the action of the muscular band opens the orifice of the second cavity at the same time that it directs the water into it; and when the cells of that cavity are full, the rest runs off into the cellular structure of the first cavity immediately below, and afterwards into the general cavity. It would appear that camels when accustomed to go journeys, in which they are kept for an unusual number of days without water, acquire the power of dilating the cells so as to make them contain a more than ordinary quantity as a supply for their journey; at least, such is the account given by those who have been in Egypt. When the cud has been chewed, it has to pass along the upper part of the second cavity before it can reach the third. How this is effected without its falling into the cellular portion, could not, from

any inspection of dried specimens, be ascertained; but when the recent stomach is accurately examined, the mode in which this is managed becomes very obvious. At the time that the cud has to pass from the mouth, the muscular band contracts with so much force, that it not only opens the orifice of the second cavity, but acting on the mouth of the third brings it forward into the second, by which means the muscular ridges that separate the rows of cells are brought close together, so as to exclude these cavities from the outlet through which the cud passes.

In the Museum of the Royal College of Surgeons there is a dried preparation of the digestive organs of the camel, and in the gallery (Nos. 567, 568, and 569) portions of them may be seen preserved in spirit. The author of the account above quoted having stated that John Hunter did not give credit to the assertion that the camel can retain a quantity of water in its stomach unmixed with the food, and capable of being recovered after the animal has been killed, it became necessary that there should be some explanation of that great physiologist's real views of the subject. We find, accordingly, in the valuable catalogue of the college museum, under No. 567, which exhibits a portion of the reticulum or water-bag, the following interesting narrative:— 'There exists a general belief, founded on the concurrent testimonies of travellers who have visited the desert regions inhabited by the camel, that that animal can retain a quantity of water in its stomach unmixed with the food, and capable of being recovered after the animal has been killed. P. Rrault (*Mém. pour servir à l'Hist. Nat.* Paris, 1676) and Daubenton (Buffon, *Hist. Nat.* 4to. t. xi. p. 227) drew the same conclusion from their dissections of the camel; but it has been said that "Mr. Hunter did not give credit to the assertion." On referring, however, to the work stated by Sir Everard Home, in his *Lectures on Comparative Anatomy*, to contain Mr. Hunter's observations on the subject, he would appear rather to have maintained a contrary opinion. The passage occurs in the following note by Dr. Patrick Russell, in the Appendix to his brother's History of Aleppo:—"That water, in cases of emergency, is taken from the stomach of camels, is a fact neither doubted in Syria nor thought strange. I never was myself in a caravan reduced to such an expedient; but I had the less reason to distrust the report of others, particularly of the Arabs, seeing that even the love of the marvellous could in such a case be no inducement to invention. It may perhaps be superfluous to produce the authority of an Arab historian (Beidawi), who, in his account of the Prophet's Expedition to Tabuc against the Greeks, relates, among other distresses of the army, that they were reduced to the necessity of killing their camels for the sake of the water contained in their stomachs. (Salo, *Koran*, p. 164; Gibbon, *Decline and Fall of the Roman Empire*, v. p. 245.)"

'On my return from the East Indies, in 1789, hearing accidentally that my friend Mr. John Hunter had dissected a camel, and was supposed to have expressed an opinion that the animal's power of preserving water in its stomach was rather improbable, I took an opportunity of conversing with him on the subject, when (to the best of my recollection) he told me "that he by no means drew any such absolute inference from his dissection; that he saw no reason for assigning more than four stomachs to the camel, though he could conceive that water might be found in the paunch little impregnated by the dry provender of the desert, and readily separating or draining from it."

"In hopes that other particulars might be found among the papers of my lately-deceased friend, I applied to his brother-in-law, Mr. Home, who informed me that he had examined them, but without discovering any observations on the subject." (Vol. ii. p. 425.)

'From these remarks, then, it appears that the small cavity regarded by Daubenton as analogous to a reticulum, was not considered by Mr. Hunter as of sufficient importance to be ranked as a distinct stomach; and the water-bag must therefore, in his opinion, have held the place of the honey-comb-bag in the horned ruminants. And when we compare the relation of the reticulum to the rumen in that tribe, with the corresponding free communication which subsists between the water-bag and rumen in the camel tribe; and when also we observe in both the precise correspondence in the mode of communication of these two cavities with the oesophagus and with the muscular apparatus destined to convey the remasticated food beyond their apertures into the third cavity, and at the same time find an approach to

the peculiar disposition of the cells of the water-bag in the reticulum of some of the horned ruminants; it becomes evident that the two cavities are analogous, the reticulum of the camel being modified for its destined functions by the greater development of the secondary cells, by the absence of a cuticular lining, and by the production of the inner layer of the muscular tunic, which forms the apparatus for closing the orifices of the primary cells. The third cavity, therefore, which could not have been recognised as a distinct compartment in the llama, and which undoubtedly receives the remasticated food in the camel, ought rather to be regarded as a peculiar structure, to which nothing analogous is to be found in the stomachs of the horned ruminants.'

[Cells of Camel's Stomach, one-ninth of natural size.]

Here is represented the muscular arrangement provided for closing the orifices of the cells, so as to prevent the food from falling into them. The cells themselves are exposed, bringing into view their bottoms, the muscular conformation of which enables the animal to give out their contents.

The seven callosities on the flexures of the limbs and chest, and the hump on the back, seem, perhaps, to bear more relation to the necessities of the animal, considered as the slave of man. These callosities are the points whereon the animal rests when it kneels down to receive its burthen; and there are not wanting those who argue that they are the result of this domesticated state, as corns are produced by the pressure of a tight shoe. Sauti observed these callosities upon a young camel just after its birth, at Pisa; but it may be said, particularly as there is no period known when the camel was not under the control of man, that these callosities have been handed down from generation to generation from the aboriginal enslaved race. On the other hand, a child is not born with corns; nor can the instances of hornless oxen and sheep and rumpless fowls, where a defect has been carefully followed up till the horn or rump has disappeared, be looked upon as parallel. We must add, moreover, that the hump, which is a fatty secretion, is known to be absorbed into the system when the animal is pinched for food, thus forming a provision against the casualties of a life ordained to be spent in the desert; nor are the callosities more than we should expect as protections for those parts of the limbs on which the body, when the animal is taking its rest, is supported on the arid sands.

Uses.—The camel furnishes the Arab with flesh and milk; of its hair he weaves clothing and even tents; his belt and his sandals are the produce of its hide; and the dung affords him fuel. The soot of this fuel, after having undergone the process of sublimation in closed vessels, produced the *sal ammoniac*, or *muriate of ammonia*, which was formerly imported from Egypt into this country, where the alkali is now, however, manufactured in a variety of ways. In the East the hair of the camel is made into cloth; the raiment of John the Baptist was of camel's hair: (*Matthew*, iii. 4; *Mark*, i. 6.) It is principally imported into these islands for the manufacture of pencils for the painter. The hair which is the product of Persia is held in the greatest estimation. There are three qualities—black, red, and grey; the black brings the best price, the red comes next in value, and the grey is only valued at half the price of the red. But these uses are mere trifles when compared with the paramount importance of these animals as commercial vehicles, 'ships of the desert,' as they have been poetically termed; for they are the living machines by means of which communication is kept up across the most desolate and frightful deserts, which, without some such aid, would be entirely impassable by man. These toilsome journeys over the most dreary and inhospitable regions, the organization of the camel, of which a sketch has been attempted, and its

extreme temperance, enable it to perform with comparative ease.

The load of a *heavy* or *slow-going* camel in one of the caravans is, according to Major Rennell, from 500 to 600 weight. The latter is the amount given by Sandys as the ordinary load; 'yet,' he adds, 'will he carry a thousand.' At Pisa the burthen of a full-grown camel is stated to be sometimes fourteen kilogrammes (above 800 lbs.) The mode of training the beast to bear these loads seems to vary. Bruo, speaking of an African mode (Senegal), towards the end of the seventeenth century, says, 'Soon after a camel is born, the Moors tie his feet under his belly, and having thrown a large cloth over his back, put heavy stones at each corner of the cloth, which rests on the ground. They in this manner accustom him to receive the heaviest loads.' Santi describes the method adopted at Pisa. At the age of four years, a camel which is intended for labour is broken in. The trainers first double up one of his fore-legs, which they tie fast with a cord; they then pull the cord, and thus usually compel the animal to fall upon his bent knee. If this does not succeed, they tie up both legs, and he falls upon both knees and upon the callosity which is upon his breast. They often accompany this operation with a particular cry and with a slight blow of a whip. At this cry and blow, with the addition of a sudden jerk downwards of his halter, the camel gradually learns to lie down upon his belly, with his legs doubled under him, at the command of his driver. The trainers then accustom him to a pack-saddle, and place on it a load, at first light, but increased by degrees, as the animal advances in docility, till at last, when he readily lies down at the voice of his driver, and as readily rises up with his load, his education is so far complete. The camels at Pisa, it appears, do not complain if too heavily laden; but in Egypt, according to Denon, they remonstrated loudly on such occasions, crying out when they were laden too heavily or unequally.

In travelling with a caravan, the acute sense of smelling possessed by the camel is strikingly displayed. When apparently completely worn out, and when all have been on the point of perishing with thirst, he has been known to break his halter and run with unerring certainty to a spring which had escaped the observation of the other quadrupeds of the caravan, and of man himself. Some of these accounts of the pilgrimages and other journeyings across the deserts are full of the wild and wonderful; but our limits do not allow us to enter into the details, for which we must refer the reader to a very interesting account of the camel in 'The Menageries,' vol. 1, and the authors there quoted, as well as others who have written on the subject; and almost every African and oriental traveller has done so.

Geographical distribution.—Arabia, Persia, the south of Tartary, some parts of India, and Africa, from Egypt to Mauritania, and from the Mediterranean to the river Senegal, appear to be the countries over which the Arabian camel is principally distributed. It is also numerous in the Canary Islands. That it was a native of Asia from the earliest times, and the great oriental commercial vehicle of ancient as it is of modern days, cannot be doubted. We trace it repeatedly in the Scriptures. Thus when Joseph's brethren had cast him into the pit, and, after the commission of their crime, had sat down to eat bread, 'they lifted up their eyes and looked, and, behold, a company of Ishmaelites came from Gilead, with their camels bearing spicery and balm and myrrh, going to carry it down to Egypt' (Gen. xxxvii. 25). Again, in Judges, viii. 21, we read that 'Gideon arose and slew Zebah and Zalmunna, and took away the ornaments that were on their camels' necks.' In Genesis xxxi. 7, we find that Jacob 'divided the people that was with him, and the flocks, and herds, and the camels, into two bands;' and the domestic state of the animal at this early period is further proved by verse 15 of the same chapter, where we see, as part of the present sent by Jacob to propitiate Esau, 'thirty milch camels with their colts.' In Leviticus, xi. 4, the camel is enumerated among the forbidden animals, 'because he cheweth the cud, but divideth not the hoof: he is unclean unto you.' Part of Job's 'substance (i. 8) consisted of three thousand camels;'* and the third messenger of evil informs him (ii. 17) that 'the Chaldeans made out three bands, and fell upon the camels, and have carried them away.' When, after his

afflictions, the Lord blessed the latter end of Job more than his beginning' (xlii. 12), 'six thousand camels' formed a portion of the blessing. And here we may observe that though the inquiry has been the subject of much research, there is no satisfactory evidence of the existence of the camel in an originally wild state at any period whatever. Diodorus and Strabo indeed mention its existence in such a state in Arabia; and Desmoulins, who has written most valuably on the subject, asserts that it so existed at the time of Hadrian: the natives, too, of Central Africa maintain, it is said, that the animal is to be found wild in the mountains where Europeans have never penetrated. But it is far from improbable that these wild camels might, like the wild horses of the American prairies, have owed their parentage to camels which had escaped from the control of man. Cuvier, in relating the report of Pallas upon the evidence of the Bucharians and Tartars, that there are wild camels in the deserts of the middle of Asia, well remarks that it must not be forgotten that the Calmucks give liberty to all sorts of animals from a religious principle.

In Europe, Pisa seems to be the only locality where the camel is now bred. At San Rossora the arid plains and stunted bushes bear some distant resemblance to the Asiatic and African desert; but most authors who understand the subject agree in considering that the race is fast degenerating. The time of their introduction into Tuscany does not seem to be accurately known, but there is good evidence that the assertion of their having been reared at Pisa since the time of the crusades, made by the writer of a somewhat eccentric work on geology, rests on no very sure foundation. The sixteenth century would be probably a date nearer the truth. In 1732, when the stud at San Rossora was dwindled down to six females, the government strengthened it by the importation of thirteen males and seven females from Tunis; in 1789 it numbered one hundred and ninety-six, including both sexes; and in 1810 it had fallen off to about one hundred and seventy.

The Arabian camel was introduced into Spain by the Moors; and the southern districts possessed many of these animals for a considerable period after the conquest of Granada; but they are now no longer to be found as a species in the Spanish territory. After the conquest of Spanish America, an attempt was made to introduce them into that country by Juan de Reinega, a Biscayan; and Acosta saw them, towards the end of the sixteenth century, at the foot of the Andes. But the introduction of these animals was looked upon with no favourable eye by the ruling Spaniards, and they gradually dwindled away. They have, however, been lately imported with greater success from the Canary Islands. Humboldt mentions them, and particularly some that he saw feeding under a palm-tree near New Valencia.

Species 1.—*Camelus Bactrianus*, Linn.; *Le Chameau*, Buffon.

The Bactrian Camel.

Two humps on the back. Length about ten feet. Hair shaggy, particularly under the throat. Colour generally dark brown. Localities, Persia, Turkey, &c.

Pallas, as we have before observed, states that very large camels, with two humps, occur in a wild state in the deserts of Shamo, towards the frontiers of China. But it must be

[*Camelus Bactrianus*.]

* Camels noticed that Aristotle observes that there have been persons who have possessed as many as three thousand camels, the precise number of Job's.

recollected that the Calmucks, as is before noticed, liberate all animals upon a principle of religion. The species is comparatively rare; but in the middle zone of Asia, north of the Taurus and the Himalaya mountains, it is found in comparative abundance. Not that it is not to be seen occasionally in other countries; in Arabia, for instance; but such instances are said to be uncommon. The Bactrian camel is stouter and more muscular than the Arabian den, and his strength is in proportion.

—White or cream-colour.

es 2.—*Camelus Dromedarius*, Linn.; *Le Dromedaire*, Buffon.

The Dromedary.

One hump, situated on the middle of the back. Length, about eight feet. Hair, pale brown. Localities, Arabia, Africa, &c.

Purchas (book vi., c. 1, s. 9) says that of camels there are three kinds; the first called Huguin, of tall stature and able to carry a thousand pounds weight; the second less, having a double bunch, fit for carriage and to ride on, called Beckett, bred only in Asia; the third sort, called Raguahill, small, able to travel (for they are unfit for burthens) above an hundred miles in a day. The king of Tombuctoo can send messengers on such camels to Segelmessc or Darha, nine hundred miles distant, in the space of eight days at the farthest. He further states that such enduring swiftness would be almost incredible, were it not corroborated by the best authorities, who all agree in their accounts of the speed of the Heirie, *El heirie*, or Maherry of the desert—Purchas's Raguahill. 'When thou shalt meet a heirie,' say the Arabs in their poetical mode of expression, 'and say to the rider Salem Aleik, ere he shall have answered thee Aleik Salem, he will be afar off, and nearly out of sight, for his swiftness is like the wind.' The 'Sabayce,' said to be the fastest breed of the swift dromedary, will, it is asserted, perform a journey of thirty-five days' caravan travelling (about eighteen miles a day) in five days, performing six hundred and thirty miles in that small period of time. Riley often travelled on a dromedary at the rate of seven or eight miles an hour for nine and ten hours a-day; and Lyon says that the Maherry of the Northern African Arabs will continue at a long trot of nine miles an hour for many hours together.

Varieties.—Besides the swift variety above alluded to, the species varies in colour, like the Bactrian, being sometimes cream-coloured or even white. There are specimens of each colour in the gardens of the Zoological Society in the Regent's Park.

[*Camelus Dromedarius*.]

The natural family of the *Camelidae* comprises also the South American form so well known by the name of *Llama*. [LLAMA.]

FOSSIL CAMELS.

It is said that the fossil remains of a camel have been found in the Sub-Himalayan range by Captain Cautley, to whom geologists are already so much indebted for his Palaeontological communications.

CAMEL, a machine invented by the Dutch, about the year 1688, by which vessels can be carried into harbours

which without such aid would be inaccessible. The camel, as described by Beekmann in his *History of Inventions*, consisted of two half ships, built in such a manner that they could be applied on each side of the hull of a large vessel. On the deck of each part of the camel a number of horizontal windlasses were placed, from which ropes proceeded through openings in one half, and being carried under the keel of the vessel, entered similar openings in the other half on the opposite side, and were attached to the windlasses on its deck. When about to be used, as much water as was necessary was suffered to run into them; all the ropes were then cast loose, and large beams were placed horizontally through the port-holes of the vessel, the ends resting on the camels alongside. When the ropes were made fast, and the vessel properly secured between the camels, the water was pumped out, on which the camels rose and bore up the vessel. A ship drawing fifteen feet water could by this means be made to draw only eleven; and the largest ships of war could be made to pass without obstruction all the sand banks of the Zuyder-Zee. Improved methods of preventing the obstruction of harbours have superseded the use of the camel. A plate of the camel is given in the French 'Encyclopédie.' (Beckmann's *History of Inventions*, vol. iii. pp. 337—343.)

CAMELFORD. [CORNWALL.]

CAME'LLIA, a genus of greenhouse shrubs belonging to the natural order Ternstroemiaceae in polypetalous dicotyledons, and nearly related to the plants which yield the tea of the shops. All the species are natives of China and Japan, or of corresponding climates in the north of India, whence they have been introduced to Europe. *C. Japonica*, a species with broad shining leaves and red flowers, is the origin of the numerous beautiful varieties now so common in gardens. The principal part of these have been raised by the skill of the Chinese or Japanese, and are remarkable not only for their gay colours, but for the great symmetry with which their petals are arranged, the flowers when seen in perfection resembling nothing so much as beautiful shell-work. The sorts that have been raised in this country are in most instances inferior to the Chinese in symmetry, but they occasionally surpass them in richness of colour. Camellias succeeded best when treated as conservatory plants, that is, when planted in the open border under glass, and just protected from the frost, especially if they are freely exposed to light and air. They then grow into large evergreen bushes, covered with a dense foliage, upon which their gaudy flowers are beautifully relieved, and are far handsomer objects than when their roots are confined within the narrow compass of a garden-pot. Many of the varieties are nearly hardy, that is, they can bear the ordinary winters of England almost without protection; but then are so very inferior to the conservatory specimens as to be little worth the having as out-of-doors shrubs, unless upon our south west coast, in some of the warm bays of Devonshire and Cornwall. They are multiplied by cuttings, grafts, and buds, and also by seeds, which the Waratah and some single sorts produce in plenty.

The other species of camellia in our gardens which deserve notice are, the *C. multiflora* or the *apple-blossomed*, which is probably a mere variety of the last: *C. oleifera*, whose seeds yield a valuable oil in China; and *C. reticulata*, which is by far the handsomest of all. The leaves of this species are very remarkably netted, and the semi-double flowers, which are sometimes as much as six inches across, are of a deep rich rose-colour. It evidently prefers to be treated as a conservatory plant, by being planted in a pit, or green-house, in the open mould. If confined in a pot, its leaves are apt to become white and unhealthy. If placed in a bright hot-house its leaves and flowers are rendered much deeper coloured, but altogether smaller, and the shoots more stunted. This sort will not easily propagate either by buds, or cuttings, or grafts, like the common camellia, but requires to have its young wood marched upon healthy young camellia stocks, when it takes freely; but the parent plant suffers so much from the mutilation attendant upon this process, that it is two or three years before it is sufficiently recovered to submit again to the operation.

CAMELOPARD. [GIRAFFE.]

CAMELOPARDALUS, the camelopard or giraffe, a constellation formed by Hevelius. A line drawn from Capella to the pole-star passes right through the body of the constellation: the hind part precedes an night ascension, for which the whole ranges from four to eight hours. The

letters are of course Bayer. The following principal stars.

Character.	No. in Catalogue of		Magnitude.

The first star is Piazz, iv. 176: it was considered by Flamsteed as in Ursa Major. (Bailey's *Flamsteed*.)

CAMEO, or **CAMAIEU**. There has been much unsatisfactory discussion respecting the origin and exact meaning of the word Cameo, and Ducange, Lessing, and others have quoted various ways of writing it. In the language of art the term is usually applied to gems or stones that are worked in *rilievo*; that is, in which the object represented is raised above the plane of the ground, in contradistinction to **INTAGLIO**, in which the subject is engraved, or indented; strictly speaking, it refers to such stones only as have strata or grounds of different colours.

The art of engraving stones is of high antiquity: but it was for the most part confined to *intaglio*, or indenting, a simpler and an easier process than relieving the work from a ground; and as such stones were used for signets or seals in very remote ages (*Erod.* xxviii. 11. 21, &c.), the *intaglio* mode of working seems to be the most natural as well as the best adapted to the purpose.

It has been supposed that the Etruscans had the art of engraving hard stones before it was known to the Greeks; and from the forms resembling those of the *scarabæi* of the Egyptians, it has been thought that their knowledge was derived from Egypt. Many engraved stones however that are called Etruscan are doubtless early Greek, as may be inferred from their subjects, and from the occurrence in the inscriptions of characters of a Greek form.

The earliest Greek artist mentioned as an engraver of stones is Theodorus of Samos: Herodotus (iii. 41) tells us that the famous ring of Polycrates 'was the work of Theodorus, the son of Telecles the Samian.'* The first name of very great note that occurs in this branch of art is that of Pyrgoteles, who lived in the time of Alexander the Great, and who alone was permitted to engrave the portrait of Alexander. Tryphon deserves mention also in this place, being the author of a beautiful and well known cameo in the Marlborough collection, representing the marriage of Cupid and Psyche. He is supposed, on good authority, to have lived under the immediate successors of Alexander in Macedon.

The age of Augustus is remarkable for the excellence of the gem-engravers who were then living. Among these Dioscorides, or more correctly Dioscourides, held the highest rank. He seems however to have worked chiefly in *intaglio*. Some of his productions have reached our times, and prove that the estimation in which he was held was not undeserved. Dioscorides was under Augustus what Pyrgoteles had been under Alexander. From Augustus down to Marcus Aurelius there were engravers of gems, both in cameo and *intaglio*, of very distinguished merit. They were chiefly Grecian artists who settled in Rome. There were however some Roman gem-engravers who held a respectable rank; but the list is not considerable.

The Greek artists preferred representing the naked figure, and the finest works produced in Greece are seldom draped; while those executed in Rome, whether by native or by Greek artists, are for the most part clothed. Dioscorides continued to follow the taste of his own nation, and all his

* of this name, one of whom lived about 700 B.C., (Sillig. Cat. Artif.)

figures, with the exception of a Mercury in the cabinet of France, are believed to be naked.

It is impossible to describe works of this sort, containing so much fine detail, with sufficient accuracy to convey a just idea of their merits. They must be seen, and examined with care, to be properly appreciated, but it may not be amiss to notice a few of the most celebrated camei that are preserved in the museums of Europe. One of the finest is the Apotheosis of Augustus, in the collection at Vienna. It represents Augustus, his wife Livia, as Rome, accompanied by her family, with Neptune and Cybele; another is of an Imperial Eagle; also a Ptolemy and Arsinoë, &c. In the French collection the sardonix of Tiberius is one of the best known: it exhibits the Apotheosis of Augustus and the princes of the house of Tiberius; a Jupiter Ægioculus is a very fine specimen: to which may be added the Apotheosis of Germanicus; and one of Agrippina and Germanicus; with others, particularly some portraits of great interest. We possess in this country some camei of first-rate excellence, but they are chiefly in private collections. The whole of the above are also remarkable for the different strata or zones of colour which they exhibit.

The ancients were fond of decorating their drinking-cups with precious stones and *camei*. They called such vessels 'gemma potanæ.' Many of them are preserved in the cabinets of the curious. They are usually of sardonix.

The workers in cameo not only exercised their skill in the cutting or engraving, but also in so arranging their subject and the composition of its details as to make the different colours or zones of the stones answer for parts of the design; as, for example, in relieving fruit, flowers, or drapery in colour, while the other parts, as the flesh of a portrait or figure, were left white; or cutting the subject entirely in white, and working no deeper into the stone than the first layer of colour; thus making, or rather leaving, a natural dark back-ground for the design. These irregularities or accidents are sometimes taken advantage of so skilfully, that it is very difficult to decide whether the variety is the effect of art, or really the natural colour of the stone.

The ancients were so partial to this variously-coloured work, that they even imitated the material, in glass, and we possess in this country one of the most beautiful specimens of their ability in the Barberini, or as it is commonly called the Portland Vase, now in the British Museum. The ground is of a rich and deep blue, while the subject, consisting of several figures in low relief, is of a tender and semi-transparent white colour. As a work of art its execution is of the very first quality. This celebrated vase was discovered in the sixteenth century, in a sarcophagus in the tomb of the Emperor Alexander Severus and his mother Julia Mamaea, on the road from Rome to Frascati, and was for more than two centuries in the Barberini Palace at Rome. It then fell into the hands of Sir W. Hamilton, from whom it was purchased by the duke of Portland. It is believed to be the only perfect specimen of the kind existing; other cabinets possess examples of it, but they are only in fragments.

At the decline of the Roman empire gem-engraving fell with the other arts, and it was not till a late period that the taste and munificence of the Florentine family of Medici caused its revival in Italy, and tempted artists to devote themselves to its practice. It was much encouraged in the fifteenth century. The wealthy required such works for ornamenting their dress, for inlaying and embossing vases, and similar display; and as objects in *rilievo* had a richer effect than others, cameo-collecting became a passion in Italy. Vasari and Maretti may be referred to as the historians of the Italian gem-engravers of that period: and the fifteenth and sixteenth centuries will be found to boast several very distinguished artists in this class. In the succeeding century there was a considerable falling off, but in the eighteenth the art again rose, and the names of some who exercised it will bear comparison with those of almost any age. The greater part of these were Italians, but two of the most celebrated were natives of Germany, and are justly entitled to particular commemoration. The works of John Pickler and Laurence Natter challenge competition with the finest antiques. Natter has left a valuable work on his art, entitled 'De la Méthode Antique de graver en Pierres fines,' &c. Raspe's 'Catalogue of Tassie's Gems' may also be consulted with advantage by those who desire to extend their knowledge on this subject.

The practice of working camei on shells, *conchylis*, is of

comparatively modern introduction in Italy; but it is now carried to so great an extent, in Rome particularly, and exercised with such success, that we feel fully justified in including it in our notice of the art; and we may even express the hope that it may be more practised by our own gem-engravers. The subject is worked in *rilievo* in the white portion or outer crust of the shell, while the inner surface, of a pink or reddish-brown tint, is left for the ground.

The art has never been sufficiently encouraged in this country to lead any great number of artists to pursue it exclusively; but England has notwithstanding produced a few eminent gem-engravers, and the names of Marchant and Brown particularly deserve honourable mention. Some artists of the present day also bid fair to carry the art to a high degree of perfection.

CAMERA LUCIDA and **CAMERA OBSCURA**, the light and dark chamber, a name given to two methods, very like in principle, of throwing images of external objects upon a plane or curved surface, for the purpose of drawing or amusement. In the first contrivance there is no chamber, but as it was the last invented, and as its predecessor had been called *camera obscura*, it was called *camera lucida*.

The earliest description of the camera obscura is in the seventeenth book of the *Magia Naturalis* of John Baptista Porta, who directs, "Make a small aperture in the shutter of a perfectly dark room, and to let the light fall upon a

white screen or wall. It is evident that in this way inverted images will be obtained, the magnitude of which will depend upon the distance of the screen from the aperture.

Porta makes one more step towards the present instrument. He states as a secret which he had concealed then, and had intended always to conceal, that if a box glass be applied to the aperture, all external objects will be seen as clearly as if a bystander, with so much pleasure that those who see it can never enough admire it. He does not appear to have found out that the screen should be curved, in order that the points of convergence of all the pencils should fall exactly upon it. The present form of the camera obscura is as follows:—The box in the diagram has a tubular lateral opening which should, if the

lens be large, be partly closed by a diaphragm to diminish the effective aperture. The rays passing through the lens from a distant object are prevented from converging by meeting a mirror inclined at 45° to the bottom of the box, and are thus made to converge at or very near to the glass plate A, one side of which is ground. A shade over the glass plate excludes direct light from falling on it. The under side of the glass plate should be curved; but, generally speaking, the aperture is so small that this is of little consequence, the trivial purpose of the apparatus being considered. The tube in which the lens is placed is made to slide, so that it can be adjusted to near or distant objects. The instrument being adjusted, the landscape directly in front of the object glass will be painted on the glass A and not inverted, but only the right side on the left, and *vice versa*. Sir D. Brewster (*Optics*, 3^d ed. *Cyclopædia*) remarks that he has found advantage in using the silver back

of a looking-glass smoothed with tinfoil as a mirror, and a film of milk dried on a plate of glass instead of ground glass.

The camera lucida is an invention of the late Dr. Wollaston. It depends upon the phenomenon [REFRACTION] that when light is attempted to be thrown into a rarer medium from a denser at more than a certain angle, depending upon the two media, none will pass through, but all will be reflected. The following is the description of Dr. Wollaston's apparatus; modifications may be found in Coddington's 'Optical Instruments' and the treatise of Sir D. Brewster, already cited. We omit detail of fittings and adjustments.

A B C D is the section of a glass prism, having an angle A D C of 135° . This is presented to the object in question

in such a way that the pencils of rays proceeding from it fall on the surface C D at an angle of 45° or nearly so, and therefore, by the preceding principle, are reflected on A D, and again from A D to the eye, through an opening K L, which excludes all except the end of the prism at A, and a part of the sheet of paper or other flat surface G H. Hence the image of Q is thrown towards the visible part of the paper, and the eye viewing both the image and the sheet of paper (with different parts of the pupil, however, which creates a difficulty in using this instrument) the observer is enabled to trace the object upon the paper by means of one of the following adjustments:—

1. If Q be very distant, so that the rays of the pencils are nearly parallel, those rays will emerge nearly parallel, or the image will be at about the same distance beyond G H in appearance as the object Q is beyond B C. But the image must appear to be thrown upon the paper, or it cannot be distinctly traced. Either therefore the image of the paper must be removed to that of the object, or that of the object must be brought up to the paper. For long-sighted people, or those who see objects best at a distance, the first is most advantageous. It is done by placing a concave glass M, the principal focus of which shall be in or near the paper.

The consequence is, that the pencils from the points of the paper are rendered nearly parallel, and by an adjustment for raising or lowering the lens the image of Q may be made to appear to coincide with that of the paper. But for short-sighted persons, who require near objects or divergent rays, the end may be answered by employing, instead of the convex lens at M, a concave lens at N, which makes the rays of the image diverge, and by adjustment of which they may be brought to appear as pencils diverging from the paper. Mr. Coddington has remarked that this lens must produce an unnecessary distortion of the image, and that a short-sighted person had better use the convex lens at M, in the manner of a long-sighted person; using spectacles, or placing a concave lens at K L, to bring the images nearer, or to render the rays more divergent.

2. When the object Q is near the prism, the latter is raised or lowered on its pillar until the paper and the object are at equal or nearly equal distances from the prism. The image of Q will then be thrown on the paper without any necessity for a lens.

The camera lucida thus described presents the objects direct, and without reversal of left and right; but it is by no means an easy instrument to use. There is what is called a knack, which some can acquire, and some cannot. But every one can use the camera obscura.

A camera obscura for exhibition is generally made in a room with a conical roof and an aperture at the top. Above this aperture is a revolving plane mirror inclined at 45° , and reflecting pencils downwards. A convex lens causes the pencils to converge upon a surface of plaster of Paris, properly curved. The mirror revolves about a vertical axis, thus allowing all the compass-points of a landscape to be successively thrown on the surface.

On these toys we must observe that they are *artificial eyes*. The rays are collected by a lens or prism, and are then made to paint images on a surface, which answers to the retina. Or conceive we may say that, in the common experiment of cutting away part of the eye of a dead animal to show the images on its retina, the eye thus employed is converted into a camera obscura.

CAMERA'RIVS, JOACHIM, was born at Bamberg in 1500, studied at Leipzig, and became a great friend of Melancthon and other reformers. The duke of Würtemberg gave him the direction of the new University of Tübingen. In 1541 he was charged by Henry duke of Saxony with reforming the University of Leipzig, of which he was afterwards appointed rector. In 1568 the Emperor Maximilian, who had called him to Vienna to consult him about some important state-affairs, wished to retain him as his counsellor, but Camerarius declined the offer on account of his infirmities. He died at Leipzig in April, 1574. Camerarius was one of the most distinguished scholars of the age of the Reformation. The following are his principal works:—1. 'Libellus Scholasticus,' containing maxims and precepts from Pythagoras, Phocylides, Solon, and extracts from Tyrtæus, Simonides, Callimachus, &c. 2. 'Narratio de H. Eobano Hessio,' including biographical notices of several other learned men of the same age. 3. 'Vita Philippi Melancthonis,' a good biography of that distinguished reformer. 4. 'De rebus Turcicis Commentarii duo.' 5. 'Historia Synodi Nicenæ.' 6. 'Noticia sive de Ostentis lib. duo.' 7. 'Vita Mauritii Saxonæ Electoris.' 8. 'De Divinationum Generibus.' 9. 'De Numismatibus Græcorum et Latinorum.' 10. 'Philosophicæ Consolationes,' written by him and Sadoletus united. 11. 'Historia Narratio de Fratribus Orthodoxorum Ecclesiis in Bohemia, Moravia, et Polonia;' besides numerous translations from and commentaries on Cicero, Aristotle, Sophocles, &c. Camerarius was an excellent horseman, and he wrote a work on the art of training horses, 'Hippocomicon,' which enjoyed considerable reputation. The 'Epistolæ,' or correspondence, were published after his death by his son Joachim in two vols. Frankfurt, 1583--95. Camerarius' eldest son, John, became a councillor of the duchy of Prussia. His second son, Joachim, was a distinguished physician, and has left several works on medicine and botany. His third son, Philip, while travelling in Italy, was arrested by the Inquisition at Rome, but was afterwards released, and on his return to Germany became vice-chancellor of the new University of Altorf. He wrote 'Horarum subscriptionum Centuriæ tres,' 3 vols. 4to. Frankfurt, 1624, a work often reprinted.

CAMERONIANS, a religious body, so called from the Rev. Richard Cameron, a non-conformist preacher, who was killed with others in a conflict at Airdsmoss in the shire of Ayr, on the 20th July, 1680, in the maintenance of their doctrines. They are otherwise called 'McMillans,' from the name of the first minister who espoused their cause after the Revolution. But these, as well as the terms 'Wings' and 'Mountain men,' which are also occasionally applied to them, they regard as accidental epithets. They are sometimes also called 'Covenanters,' from their adherence to the national covenant of Scotland, and the solemn league and covenant of the three kingdoms. Their proper designation however is that of 'Reformed Presbyterians,' or, particularly in Scotland where they had their origin, 'Old Presbyterian Dissenters';—*presbyterians*, as holding the leading doctrines maintained by Calvin and his followers; *dissenters*, as separating from the Church of Scotland; and in the adjective *old* we are carried back to their origin and first rise.

It was at the Revolution that this little shoot sprung from the great branch of Calvinist reformers. The arbitrary measures of the crown, which led to that important change, roused into activity a spirit of liberty which thrilled through every part of the community. The religious feelings of the people were in a particular manner excited; and among others Cameron, the preacher above mentioned, asserted with great freedom and boldness the independence of the church. His doctrines were not more obnoxious to the government than his zeal in asserting them was dreaded by his brethren of the clergy, and in 1677 the latter formally met at Edinburgh and reproved him for his conduct. To divert his mind under the painful impressions which his promise on that occasion afterwards gave him, he retired to Holland, whence however he soon returned, and on the 22nd June, 1680, in company with about twenty other persons of the same sentiments with himself, well armed,

entered the little town of Sanquhar, in Dumfries-shire, and at the market-cross there proclaimed, in a ceremonious manner, a declaration, that Charles Stuart (meaning the king), although descended from the race of their ancient kings, had by his perjuries in the breach of his covenanted vows, his tyrannical government, and his usurpation over their civil and religious liberties, dissolved the monarchy and forfeited all right and title to the crown.

A party kept together in arms for a month in the mountainous district between Nithsdale and Ayrshire; but at length, on the 20th July, while lying at Airdsmoss in Kyo, they were surprised by a large body of horse and foot under the direction of the government, and in the short skirmish which followed, Cameron was killed, and his followers were dispersed or taken prisoners. Among the former was Cargill, who continued to preach the doctrines of the sect in the fields; and in September following, at a conventicle held in the Torwood, between Falkirk and Stirling, pronounced a solemn excommunication against the king and his brother the duke of York, the dukes of Monmouth, Lauderdale, and Rothes, the lord advocate, and General Sir Thomas Dalzell of Binns, for their exertions against the supremacy of the pure church of Scotland, their perjury in reference to the covenant, and their cruelty and oppression towards the people of God. To these acts of the royalists was soon afterwards added the Test of 1681, against which the covenanters published their testimony at Lanark on the 12th January, 1682, adhering to and confirming the Sanquhar declaration, and giving reasons at length for their disowning the king's authority. Thus they again did, and declared their firm resolution of constant adherence to the covenant, in their Apologotic Declaration of 28th October, 1684; and on the accession of James duke of York to the throne, they published another declaration at Sanquhar on the 28th May, 1685, wherein they renewed their previous declarations, and further protested against the accession of the duke of York, as a professed and excommunicated papist, and against popery itself in all its heads, as abjured by the national covenant. In these circumstances, it is plain the Revolution was an event which they would hail in common with the other Presbyterians, but the latter acquiesced in arrangements with the government into which the former refused to enter; and they have since continued to testify against the Revolution settlement, as they now also do against the Articles of Union, the Toleration Acts, the conduct of the church, and generally, all association whether of church or state with those who do not adopt the principles of Scripture, the Reformation, and the covenant.

They hold the Holy Scriptures to be the absolute rule of faith and conduct, and to contain the standard of these both in church and state. Next to this they adopt the early standards of the church of Scotland, the Westminster Confession of Faith, the larger and shorter catechisms of the church, the books of discipline, and the Westminster Directory for Public Worship. And lastly, they regard the national covenant of Scotland as a continuing obligation. To these are to be added the documents published by the body itself in explanation of their principles, namely, their 'Judicial Act and Testimony,' the 5th edition of which was published at Glasgow in 1818; 'A short Account of the Old Presbyterian Dissenters,' published by authority of the presbytery in 1806; and an 'Explanation and Defence of the Terms of Communion adopted by the Reformed Presbyterian Church,' editions of which two latter were printed at Glasgow in 1824.

The religious body we are now considering was formed into a presbytery on the 1st of August, 1743, under the title of the Reform Presbytery. In Scotland, till lately, they had no higher ecclesiastical judicatory than a presbytery. They have now a synod, consisting of the Edinburgh, Glasgow, Paisley, Kilmarnock, and Newton Stewart presbyteries. The number of churches is 33, six of which however have at present no fixed minister. The number of joined members is estimated at 6000. In Ireland there is a synod of four presbyteries, and the congregations are 27 in number; and the joined members are stated at 7000. In England there are two congregations, one with an ordained minister, the other vacant. In Nova Scotia and New Brunswick there is a presbytery of two ministers. In Canada there is an ordained missionary in connexion with the Scottish synod; and in the United States there are about 60 ministers and as many congregations. In the United States there is this peculiarity, that no slave-holder is admitted to communion.

CAMILLUS, MARCUS FURIUS, a celebrated Roman, who lived about the middle of the fourth century after the foundation of the city. There is so much of the fabulous in all that is told about him that one might very reasonably suppose that Livy and Plutarch have derived the traditions respecting this warrior from some old poem. (Niebuhr, *H. R.*, vol. ii., p. 473.) That there was such a person, and that his actions entitled him to the gratitude of his countrymen, cannot, we think, be doubted, and even Niebuhr has not attempted to deny him the personality which he is unwilling to concede to Romulus and Coriolanus. (*H. R.* ii., p. 501.) Camillus was created dictator five times, and triumphed four times, but never served the office of consul. (Plutarch, *Camill. init.*) This was principally owing to the substitution of the military tribunate for the consulship in the early part of his life. His first dictatorship was in the 10th year of the siege of Veii, which was taken by him probably by means of a mine, by which part of the wall was overthrown. (Niebuhr, *H. R.* ii., p. 481, who has sufficiently refuted the ordinary tradition.) He also conquered the Faliscans, who, according to the legend, yielded unconditionally to him in consequence of his generosity in restoring to them their children whom a traitorous schoolmaster had delivered into his hands. (Plutarch, *Camill.* x.) He was impeached, in A.U.C. 364, by the tribune L. Apuleius, on a charge of peculation in the distribution of the plunder of Veii, and his guilt was so manifest that even his own clients could not acquit him. (Liv. v. 32.) Camillus retired to Ardea, and lived there as an *ingulivus* till the battle of the Allia and the capture of Rome: he then took up arms for his country, and led the Ardeates against the Gauls, over whom he obtained some advantages. At length the people, sensible of the necessity of his recall, restored him to his civic rights by an ordinance of the plebs passed at Veii, and after two battles, the one fought in the city and the other on the road to Gabin, he completely exterminated the invading army. It was probably owing to his influence that the Romans were induced to rebuild their own city in preference to migrating to Veii, as many wished to do, and for this and his other services he was called the second Romulus. In his fourth dictatorship he had some more disputes with the plebeians, in consequence of which he abdicated his office. (Liv. vi. 38.) He died of the plague in the year of Rome 390. (Liv. vii. 1.; Plutarch, *Camill.* xlii.) His son and brother were also eminent men, but with these exceptions no one in his family, according to Tacitus (*Annal.* ii. 52), obtained literary renown till the age of Tiberius, when Furus Camillus, proconsul of Africa, triumphed over the Numidians. The son of this Camillus raised a rebellion in Dalmatia in the reign of Claudius, and proclaimed himself emperor, but in a few days his soldiers returned to their allegiance, and Camillus committed suicide.

CAMOENS (Dom Luis de Camões), called the Homer and Virgil of Portugal, for his celebrated poem of the 'Lusiad,' was born at Lisbon; but Coimbra and Santarem have disputed this honour with Lisbon. There is no less controversy about the precise year of his birth, which, according to some, was 1517 while most biographers suppose it to be 1524.

His family was of considerable note, and originally Spanish. In his infancy, his father, Simon Vas de Camoens, commander of a vessel, was shipwrecked at Goa, and lost, with his life, the greater part of his fortune. His mother, however, Anne de Maccio, of Santarem, was enabled to give her son such an education as qualified him for the military service and for public life. Camoens was sent to the university of Coimbra, where, notwithstanding Voltaire's rash assertion that his youth was spent in idleness and ignorance, it appears from his works that he must have acquired the substance as well as caught the spirit of classical learning.

On quitting the university Camoens returned to Lisbon. His prepossessing appearance and great accomplishments, added to his love of poetry and gallantry, which now engrossed all his thoughts, soon made him an object of public notoriety, especially as the charms of Catharina d'Atayada, a lady of honour (*dama do paço*) at the court, had captivated his heart. This amour with a lady above his rank was the origin of the long series of Camoens' calamities. He experienced the fate of Ovid, with whom he compares himself in his third elegy, written at Santarem, the place of his exile and retirement, where he also began his 'Lusiad.' Camoens soon became tired of an inactive and obscure life. To be at once a hero and a poet was his ambition. He joined,

as a volunteer, an expedition which John III. was then fitting out against the Moors of Ceuta, and greatly distinguished himself in several encounters. In a naval engagement with the Moors in the Straits of Gibraltar he was among the foremost to board, and lost his right eye in the conflict. This he relates himself in his *Canto x.*, stan. 9.

Hoping to deserve as a soldier that reward which he had failed to obtain as a poet, he returned to Lisbon; but no friend seconded his efforts at court to gain even an honourable competence. Other biographers say that he was recalled to court owing to the great military reputation which he had acquired, but that he was once more driven away by that jealousy which still dreaded his poetic gallantry, and his attentions to the ladies of the palace, though his countenance had been so sadly marred. Baffled in all his expectations, he determined to leave his native country; and accordingly he embarked in 1533 for India, in search of better prospects, or, at least, an honourable grave for his misfortunes. As the ship left the Tagus he expressed his resolution never to return, in the words of the sepulchral inscription of Scipio Africanus, — *Ingrata patria, non possidebis ossa mea*.

From this moment fate seems to watch over Camoens in all his harassing adventures and frequent dangers, in order that he might complete, as it were, his poetic career. He arrived at Goa, in one of the four ships which sailed to India, after seeing the other three perish in a storm. Not being able to find employment at Goa, he immediately joined as a volunteer a Portuguese expedition, which was ready to sail in aid of the king of Cochin against the king of Pimenta. Although a great portion of his countrymen were carried off by the insalubrity of the climate, Camoens returned safe after he had displayed his usual bravery in the conquest of the Alagada islands. In the following year he accompanied Manuel de Vasconcello in another expedition to the Red Sea, against the Arabian Corsairs. At the island of Ormuz, in the Persian Gulf, where he passed the winter, his imagination gave a poetic colouring to the scenery of that spot, and to the Portuguese achievements in India. He visited also mount Felix, and the adjacent part of Africa, which he so strongly pictures in the 'Lusiad,' and in one of the little pieces in which he laments the absence of his mistress. Unfortunately for him he indulged also in satire, and exposed in his 'Disparates na India' (Follies in India) some of the government proceedings at Goa. The viceroy immediately banished him to the island of Macao. Soon after he obtained leave to visit the Moluccas, where he collected the materials for pictorial poetry; but he could no longer, as the lines beneath his portrait express, 'bear in one hand the sword, in the other the pen,' and he was glad to accept the very unpoetic post at Macao of *provedor-mor dos defuntos* (administrator of the effects of deceased persons), by which employment he was rescued from destitution, and even enabled to make some savings. Having received permission from a new viceroy to return to Goa, he was shipwrecked in the passage on the coast of Cambodia. He saved, on a plank, and with great difficulty, only his life and his poems.*

Camoens had not long enjoyed repose when a new viceroy, lending a ready ear to his enemies, who accused him of malversation in his office at Macao, threw him into prison. Although he cleared himself of the charges, and loaded his enemies with ignominy, he was still detained for debts which he was unable to satisfy; but a poem, at once witty and affecting, which he addressed to the viceroy at length procured his liberation. Resuming the profession of arms, he accompanied Dom Pedro Barreto to the distant and barbarous settlement of Sofala. A ship bound homeward having touched at this place, his former resolution was shaken, and he determined to return to Europe. Barreto endeavoured to prevent the embarkation of Camoens by charging him with a debt for board. Anthony de Cabra, however, and Hector de Sylveira, paid the pitiful demand; and thus Camoens and the honour of Barreto, says Faria, were discharged together. Finally, Camoens, after an absence of nearly sixteen years, arrived in 1569 at Lisbon, in the most abject poverty, his poems being the only treasure and last hope which he had brought from the rich shores of India. More ill-fated still at the end of his

* He mentions this shipwreck in his *Canto X.*, stan. 128. The story, however, of his swimming ashore with his poem in one hand, while he supported himself by the other, and thus saved his 'Lusiad,' is a mere fiction. Camoens, it is said, has obtained currency through the pen of a German writer, who seems to have misunderstood Barbosa Mach.

career, he found his native city ravaged by the plague, and during such a calamity poetry could avail him still less than ever. King Don Sebastian was then concerting the plan of his unfortunate expedition to Morocco, and this induced Camoens to dedicate his poem to the youthful monarch. Although the dedication was graciously received, it was only rewarded with a wretched pension, just sufficient to mark but not to relieve the misery of its author.

It appears that Cardinal Henry, who succeeded Sebastian, withdrew that small pension. He patronized only what was called learning by the monks and friars, whose pious forgeries and miracles he highly valued. This bigot was the persecutor of George Buchanan, and the patron of the inquisition, of which he extended the horrors even to Goa. Under his weak and wicked hands the kingdom fell into utter ruin.

When we find Camoens exhorting, in his poetic and prophetic zeal, young Sebastian to exclude the clergy, by which he means, in the first instance, Cardinal Henry, from state-affairs; when we look to the man of genius, neglected by his monkish contemporaries, yet, in his old age and misfortunes, lamenting less for his own fate than for the approaching ruin of his degenerate country; Camoens, with these worthy sentiments and this unworthy destiny, commands an elevated and respectful sympathy. It is not merely the old man, or even the neglected man of genius, dying in an hospital,—it is the patriot and the patriot-bard,—the hero and the soldier,—the friend of truth, as well as the great master of fiction,—ennobling even his death upon a flock bed, by those sentiments which deepen, by contrast, the disgrace and degeneracy of his country. 'I am ending (he says in one of his letters) the course of my life: the world will witness how I have loved my country. I have returned not only to die in her bosom, but to die with her.'

The fate of Camoens throws great light on the history of his country, and appears strictly connected with it. The same ignorance, and the same degenerate spirit which suffered Camoens to starve, and to depend only on the sympathy of a foreign and aged servant,* and finally to die most wretchedly in an hospital, sank Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his end, in 1579, the year after the fatal issue of the African expedition under King Sebastian, at the battle of Alcazar.

Camoens attempted every style of poetic composition of which he had formed a definite idea, but the 'Lusiad' rises so far above his other works, that all his numerous but lesser compositions must be considered as inferior scions sprung from the same root. The 'Lusiad' is an heroic poem which differs from all others of the epic class. Camoens struck out a totally new path in the region of epic poetry.†

His object was to recount in epic strains the achievements of the great men of Portugal in general, not of any individual in particular, and, consequently, not of Vasco de Gama alone, who is commonly considered the hero of the 'Lusiad.'‡ The very title he gave it, *Os Lusitânicos* (the Lusitanians), denotes at once the true nature of its subject. An epic grouping of all the great and most interesting events in the Portuguese annals forms the whole plan, and the discovery of the passage to India is the groundwork of the epic unity of the poem, but Vasco de Gama is merely the spindle round which the thread of the narrative is wound. The 'Lusiad' has no real episode except the short story of the giant Adamastor. Unless the idea of the plan of the 'Lusiad' be rightly seized, the composition will appear in a false light on whichever side it is viewed. Designated as a whole, it may therefore be termed an epic national picture of Portuguese glory, greater however than a mere gallery of poetic stories, but less than a perfect epic. The unity of interest and effect, and consequently of the poem,

* He had a black servant who had grown old with him, and who had experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, had saved his master's life in the shipwreck where he lost all his effects—this Indian, grown old and white-haired in his service—begged in the streets of Lisbon for the only man in Portugal gifted with those talents and that spirit which alone can raise and restore the spirit of a sinking nation.

† The apology for Camoens which precedes Mickle's version of the 'Lusiad' defeats itself, for the English translator makes the Homeric epic his standard, and in order to justify the 'Lusiad,' misconstrues the machinery of the 'Iliad.' Mickle however is the only translator who has represented the elegant dignity of Camoens's style. He has exposed, moreover, several glaring instances of ignorance and misrepresentation in Voltaire's critique on the 'Lusiad.'

‡ Nuno Alvares, who saved the political existence of Portugal at the battle of Aljubarrota, might, with more propriety, be denominated the hero of the 'Lusiad.'

rests wholly and solely on the execution of the plan, out of which only a poet like Camoens could have created a 'Lusiad.'

His talent in picturesque comparison was formed on the model of Ariosto more than that of Homer. His description of Venus, who once more intercedes with Jupiter, resembles Ariosto's description of Alcina. The first idea of his Island of Love seems borrowed from the same writer. There is, however, little room to doubt that Tasso, when he trod in Ariosto's footsteps in order to describe the abode of Armida, availed himself of the description of Camoens,* as afterwards the garden of Armida furnished Spenser with his 'Bower of Bliss.'

Among the most beautiful passages of the 'Lusiad' are enumerated† the tribute to the memory of Egas Moniz, the Portuguese Regulus, who, however, ended his career more happily than the Roman consul; the description of the battle of Ourique, which laid the foundation of the kingdom of Portugal; the description of the visit of Queen Maria of Spain to her father the king of Portugal, to implore assistance for her husband in his contest against the Moors; the relation of the tragical fate of Ignez de Castro, which is the most celebrated of all the exquisite passages of the 'Lusiad'; the description of the sanguinary battle of Aljubarrota, the greatest victory the Portuguese ever gained over the Castilians; and some others of the like character, which might also be enumerated.

Camoens has left, besides the 'Lusiad,' specimens of no common merit in every style of poetry written in Portugal in his time; 301 of his sonnets which have been preserved exhibit his prolific fancy, and some of them all the tenderness and grace of Petrarch. His 17 'Canções' (songs) prove still more particularly how deeply he was penetrated with the spirit of Petrarch's poetry. The 12 odes which follow approximate more nearly to the classical style, and the first, addressed to the moon, begins in the pure ode style, and is particularly distinguished for its beauty. In his 'Sextinas' Camoens has not failed in rendering their artificial ornaments pleasing. But his 21 elegies are more worthy of attention; they are, in general, the longest poems of the collection next to the 'Lusiad' and the 'Creation.' Some were written in his youth and in exile, others during his oriental voyages and adventures. No other works of the poet so irresistibly command the reader's regret for his misfortunes, and love for him as a man.

A few poems widely differing from each other are printed under the common title of 'Estancias' (stanzas), because they are all composed in Italian octaves. The three first of the series are truly poetic epistles and faithful mirrors of the character and principles of the author.

Among the miscellaneous poems of Camoens the eclogues occupy a considerable space. They have more the spirit than the spirit of pastoral poetry. Passages in Spanish are occasionally interspersed with the Portuguese.

In the collected works of Camoens a separation is made of his poems in the Italian style and the Italian syllabic measure from those which are composed in *quintilhas*. In this style also he has enriched every species of poetic composition then known in Portugal and Spain. The *redondilhas* on his return from Macao to Goa, after he had narrowly escaped death by shipwreck, are among those best known.‡

Romantic, gallant, and comic effusions of fancy and wit (*glorias* in the Spanish style, *rollos* in Portuguese), and other poetic trifles in the Portuguese and Spanish languages, appear to have been dealt out at every opportunity with a profuse hand by Camoens, and no mental sport seems to have been too homely for him.

Finally, to leave no kind of poetical composition unattempted, he wrote (probably previous to his departure for India) three dramas: 'El Rey Seleuco' (King Seleucus), 'Os Amphitryões' (The Amphitryons), and 'Filodemo.' Had the genius which animates the 'Lusiad' taken a dramatic direction, Camoens would have been the Calderon of Portugal before a Lope de Vega had arisen in Spain.

A very good edition of the works of Camoens appeared at Lisbon in 1779-80, under the title of 'Obras de Camoens, Principe dos Poetas de Hespanha,' 4 tom. 12mo. A second

* The first edition of *Don Quixote* delivered* appeared in 1580, a year after the death of Camoens. The 'Lusiad' was printed in 1572, the posthumous edition having prevented its appearance for three years. Tasso read it, and praised the author in a sonnet, which has been preserved.

† By Houterwick, in his 'History of the Spanish and Portuguese Literature.'
‡ Standing friendless on the banks of the Mecon, in Cambolla, he composed that beautiful paraphrase, so celebrated by Lope de Vega, of the 137th psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and lamenting their exile from their native land.

edition also appeared in 1782-83 in five small volumes, the first of which contains the life of the author and the 'Lusiad,' and the last the dramatic and other pieces ascribed to Camoens. A most correct, splendid, and now rare edition of the 'Lusiad' was published, with very fine engravings, in one vol. 4to., by Firmin Didot at Paris in 1817, the expense of which was defrayed by Souza Botelho. In this edition, of which very few copies were printed, the original text has been restored with great accuracy. P. Didot, sen., had published previously a 'Lusiad' in 12mo.

CAMOMILE. [ANTHEMIS.]

CAMOUFLET, or STIFLER, in military mining, is a small charge of powder sunk in the wall of earth between two parallel galleries, in order, by blowing the earth into one of them, to suffocate or cut off the retreat of the miner who is at work in it.

CAMP. [ENCAMPMENT.]

CAMP, ROMAN. There are few parts of the art of war as practised by the Romans in which the laborious and regulated carefulness of that sagacious people is more evident than in their system of castrametation. In the present article we shall give some account of the construction of their camps, and the arrangement of the troops in them.

In speaking of the Roman camps, it is necessary to distinguish between the summer and winter encampments (*castra æstiva et hyberna*); and again to discriminate between those camps which were formed to protect the army for a short period, and those which they proposed to occupy for a longer time which were called *castra stativa*. The difference between these consisted chiefly in the

strength of the fortifications, and in the superior size of the temporary camps, which were intended commonly for the whole army, while the more permanent encampments were for divisions of the army. Winter encampments were not used by the Romans in the earlier periods of their history, when their chief wars were little more than summer campaigns, and were waged against neighbouring nations: but in a later age, when permanent conquest was their aim, and the war continued several years, the army was regularly distributed into winter-quarters, and often spread over a considerable extent of country, in order to overawe the subjugated districts, or because forage and provisions could be obtained by the army in several divisions more easily than when it was in one body. Caesar in his Gallic campaigns regularly distributed his army into winter-stations so strongly fortified that though several attempts were made upon them only one was taken, and that because the commander unwisely abandoned it. (*Cæs. de Bel. Gal.* lib. v.)

Perhaps the completest description which we have of a Roman camp may be found in Polybius, who has in the sixth book of his history given a pretty full account of the military tactics of the Romans, part of which, relating to their castrametation, we shall condense with the further information collected by General Roy. Polybius lived at a time when the institutions of the Republic were in their full vigour; he had gained military experience in the armies of his country; and his opportunities of acquiring information, both from personal observation and from the information of others, were ample.

When a place suitable for a camp had been chosen, the

Plan of the Polybian Camp of a Roman Consular Army.

THE PRÆTORIAN, OR QUÆSTORIAN GATE.

first thing was to fix a standard on the spot judged to be most suitable for overlooking the army when encamped, and sending commands to the different quarters. Round this standard a square of 200 feet was measured, and set apart for the general's quarters: this was called *prætorium* (A), from the name *prætor*, which, according to early Roman usage, was the general title of a military commander. On that side of this square inclosure which was deemed most suitable for obtaining forage and water, the bulk of the army was encamped, and that side of the *prætorium* and the corresponding side of the camp, we shall follow Polybius in calling 'the front.' In front then of the *prætorium*, distant from it fifty feet, on a line running across the camp, were placed the tents and baggage of the legionary tribunes (B B), who in the ordinary consular army (of two Roman legions with the regular proportion of allies*) amounted to twelve: and towards either extremity of the same line were the tents of the *præfecti* (C C) or officers, who held among the allies a rank similar to that of the tribunes in the legions. These tents were pitched with their backs to the *prætorium*.

In front of the tribunes' tents, a passage, 100 feet wide, called in our plan the *Principia*, or *principal street* (D D), ran across the camp; and between the side of this passage and a line parallel to it, near the front of the camp, the soldiers were encamped in lines, which formed a right angle with the *Principia*. The soldiers' quarters were divided into two parts by a passage 50 feet wide (E), which ran from the *prætorium* to the front of the camp. On each side of this street were posted the Roman cavalry, and next to them the *Triarii*, one of the divisions of the legionary infantry. Next to these were two passages of 50 feet wide (F F F F), and then the *Principes* and the *Hastati*, the other divisions of the Roman infantry. The tents of each division fronted the passage next to them, so that when the tents of two divisions, as of the cavalry and the *Triarii*, and of the *Principes* and the *Hastati*, were not separated by an intervening passage, they had their backs to each other. There were in a legion ten *turmæ* of the cavalry, and ten *manipuli* of each division of the infantry; and the *turmæ* and *manipuli* of each division were encamped in one range along the passages, a quadrangular space of 100 feet square being allotted to each *turma* of cavalry, and each *manipulus* of the *Principes* and *Hastati*, while each *manipulus* of the *Triarii*, which had seldom more than half the complement of the other *manipuli*, had a space of 100 feet by 50.

Beyond the tents of the *Hastati* on each side was another passage of 50 feet wide (G G G G), and then came the quarters of the allied cavalry, and beyond these again, without any separating passage, the quarters of the allied infantry, whose tents looked toward the ramparts of the sides of the camp. The tents of the allies occupied a space of the same length as that occupied by the legionary soldiers. The depth of their quarters varied with the number of the men: our plan assigns to the cavalry and infantry an equal depth, viz., of 200 feet each: this is probably near the truth. The quarters of the legionary soldiers and the allies were alike divided into two parts by a passage 50 feet wide, called *quintana* (H H), running across the camp in a direction parallel to that of the *Principia*, between the fifth and sixth *manipuli* and *turmæ*.

The space on each side of the *prætorium* was occupied, the one side (K) by the *quæstor* (whose office combined the direction of the commissariat department and the care of the military chest) and the military stores, and the other side (M) by the *forum*, or place for holding a market and transacting business. Next to these on each side were the quarters (N N) of the chosen troops from the extraordinary cavalry of the allies, who served in the consul's body-guard, and of the volunteers (O O) who had engaged in the service from regard to the consul. The tents of these looked towards the *quæstor's* quarters and the *forum*. Beyond these on each side, with their tents fronting the rampart of the camp, were the chosen troops (Q Q) from the 'extraordinary' infantry of the allies, who also formed part of the consul's body-guard. Behind all these, right across the camp, ran a passage or street of 100 feet wide (P P); and beyond this passage, and parallel to it, were the

quarters of the main body of the 'extraordinary' cavalry of the allies (R R); and behind these, looking towards the back of the camp, were the quarters of the extraordinary foot of the allies (S S). The flanks of these quarters (T T) were occupied by any foreigners or temporary reinforcements of allied troops which might be in the camp. Polybius does not assign any particular quarters to the *velites*, or light armed men.

The space occupied by all these quarters formed a square, and on every side was left an interval of 200 feet, which served for various useful purposes, to deposit the baggage, to afford space for the troops to enter and leave their respective quarters, and to protect the tents and troops from fire or weapons thrown by any who might assail the camp from without. The whole was surrounded by a rampart (*vallum*) and a ditch (*fossa*), through which were four gates or entrances: the *Prætorian gate* (*Porta Prætoriana*), in front of the camp, opposite the *prætorium*; the *Decuman gate* (*Porta Decumana*), at the back of the camp; and a gate at each end of the *principia* or principal street.

If the two consular armies were united, the camp formed an oblong square, and resembled two camps placed back to back, without any intervening intrenchment. It appears to have had six gates, two *prætorian* and four others, one at each end of the two principal streets or passages.

The vallum was composed usually of earth or turf, sometimes of stones or wood, and was surmounted by a palisade. The ditch was on the outside. In stations which were designed to be permanent, and which were in a disturbed or hostile country, the works were constructed with unusual care, and there are many remains or vestiges of them in different parts of Great Britain. One of the most perfect is at Ardorb, in Scotland. [ARDOCH.]

The plan of a Roman camp, which we have given, is taken from General Roy's *Military Antiquities of the Romans in Britain*, to which we refer the reader for many valuable observations on the castrametation of the Romans.

CAMPAGNA DI ROMA, the most southern division of the Papal state, corresponds in great measure to the ancient Latium in its later and more extensive sense, being bounded on the N.W. by the Tiber, which divides it from the Patrimonio di S. Pietro; on the N. by the Teverone or Anio, which divides it from the province of Sabina; on the E. by an offset of the Apennines, which divides it from the valley of the Garigliano or Liris in the kingdom of Naples, and which terminates at the sea near Terracina; on the S. and W. by the Mediterranean. The length of the province from Ostia to Terracina is about 62 miles, and its greatest breadth 45 from the Apennines to the sea. It is divided into two regions, the lowlands and the highlands, including the valley of the Sacco and part of that of the Teverone. The highlands consist of the E. Apennines; of the offset which divides the valley of the Teverone from that of the Sacco, the ancient Trerus, and on which are the towns of Anagni, Palestrina, &c.; of the Monti Lepini (Volsorum Montes), which divide the valley of Sacco from the Pomptine marshes; and lastly of the Alban or Tusculan mounts, which rise in the middle of the plain, and separate the lowlands of the Tiber from the Pomptine marshes. Towards the N. the highlands of Alba and Tusculum are connected by some high ground towards Zagarolo with the mountains of Palestrina, thus separating the waters which run eastward into the Sacco and the Liris from those which run W. into the Tiber. The Apennines and the Monti Lepini are mostly rugged and bare; the valley of the Teverone is wholesome, and the population robust, though poor; the valley of the Sacco is wide, fertile, and well cultivated. The Alba and Tusculum mounts are covered with trees, vineyards, and gardens; the air is salubrious, and the soil in many places very fertile. Those who talk of the desolation of the Campagna seem to have visited only the lowlands to the right and left of the high road between Rome and Naples, and that only in the summer months; for 'in the winter and early part of the spring you see fields and pastures decked in all the luxury of a spontaneous vegetation, numerous herds of cattle and flocks of sheep grazing on the rich grass; but as soon as the hot season comes, a sudden change takes place in the appearance of the country—vegetation ceases—first a yellow, then a grey tinge covers the ground—the dusty soil looks as if it were calcined by fire—the cattle migrate to the mountains—and the inhabitants disperse.' (Tourman. *Recherches Statistiques sur Rome*.) The lowlands of the Tiber, which form what is called l'Agro Romano, or

* The Roman legion in the time of Polybius consisted of 4200 infantry (or in time of peculiar emergency 5000 infantry) and 800 cavalry. The consular army was formed of two legions; with a body of allied foot, equal in number to the infantry of the legions, besides the extraordinaries, chosen troops of the allies, who probably amounted to 2100, or when the legion was of 5000 infantry, to 2500, and of allied horse, thrice the number of the legionary cavalry; of these allied horse one-third were drafted for the extraordinaries, making the total of the consular army 18,500, or 22,500 infantry and 2400 horse.

the territory of the city of Rome, which extends on both banks of the Tiber, and which is often confounded with the Campagna, contain, according to Nicolai's good statistical work, 111,400 rubbi (a square measure of about four English acres), of which about one-half are arable land, the rest pasture and forest, and only 1500 rubbi are marsh. This territory is divided into about 400 tenute, or farms. (*Memorie sulla Campagna di Roma*, 3 v. 4to. 1803, with a good map of the Agro.) It is evident that it is not the marshy grounds that cause the unwholesomeness of this part of the country. The surface of the soil is in fact undulating and dry, and slopes gently towards the coast; the malaria must be attributed to other natural causes. In Sir Wm. Gell's *Topography of Rome and its Environs*, with an excellent map, which embraces a larger area than that of Nicolai, and in fact almost the whole province of the Campagna, with the exception of the Pomptine marshes, we find the following statement at the end:— 'There are 242,000 rubbi of arable land, 82,000 of which are considered to be in healthy districts, and the rest, being unwholesome, are sown with grain only once in four or five years. Wheat returns about nine for one. The vineyards are 14,600 rubbi; pastures, 162,000 rubbi; orchards, 1400; woods and forests, 170,000: in all 590,000 rubbi, or 2,360,000 acres, besides rocks, sands, marshes, rivers, &c., which occupy about 145,000 rubbi more. There are 700,000 sheep, 105,000 horned cattle, 4000 buffalos, and 35,000 horses, besides pigs and goats.' This statement, which is taken from Marini's work on the Catasto, comprises, however, also part of the adjoining province of the Patrimonio di S. Pietro, on the right bank of the Tiber. The great plain between the S. slope of the Lepini and the sea, which is known by the name of the Pomptine marshes, extends from Torre Tré Ponti to Terracina, a length of about twenty-two miles by ton of breadth; of this extent only the lower tract, about 65,000 rubbi, is really marshy. Pius VI. drained 9000 rubbi which were constantly under water. Of the whole extent of the marshy ground, one-third is susceptible of cultivation; another third is in pasture, and the rest forest or marsh. The extent of the province of Campagna, including that part of the territory or jurisdiction of Rome which lies on the left or E. bank of the Tiber, is calculated at 2266 square miles, of which about one-half is unwholesome, and only inhabited by a permanent population of about 15,000. The whole province contains 259,800 inhabitants, exclusive of the city of Rome, which has a population of 152,000. (Calindri, *Statistica*, Noigeaur, Tournon, Sir William Gell, &c.)

This province is now divided into two administrative jurisdictions, namely, the Delegation of Frosinone and Pontecorvo, and the Comarca of Rome. The towns of the Delegation of Frosinone are—Frosinone, the ancient Fusioma, a town of the Volsci, afterward a Roman colony; it is built on a hill at the opening of the valley of the Cossa into that of the Sacco, in the midst of a well-cultivated country, is the residence of the delegate, has an old castle, a college or gymnasium, and 7000 inhabitants; Ferentino, with 6700 inhabitants, a bishop's see, has remains of ancient Pelasgic or Cyclopean walls as they are called, which are found in many places in this district, and have been examined and described by Pefit, Radcl, Dodwell, and Madame Dionigi; Alatri, built on a steep hill above the valley of the Cossa, is a bishop's see, has 8000 inhabitants, and manufactures of coarse woollen cloth. On the summit of the hill is a vast space, surrounded by a wall formed of large irregularly-shaped stones, many from six to nine feet in length, put together without any cement, but fitting admirably. The wall of this Acropolis is twelve feet thick, and in some places fifty feet high. Two gates lead into the enclosed space, where the cathedral and the episcopal palace have been built. Veroli, a bishop's see, also built on a mountain, has 7000 inhabitants, mostly agriculturists; N. of it, near the source of the Cossa, is the fine Carthusian convent and church of Trisulti, built in a wild glen of the Apennines; and near the village of Colleparado is a vast cave in the form of a dome, nearly 200 feet high, full of splendid stalactites. Anagni has 5400 inhabitants. (ANAGNI.) Ceccano has 4500 inhabitants, and Ceprano on the Liris, above its junction with the Sacco, and on the frontier of the kingdom of Naples, has 2500. The other towns are: Banco, 3800, with manufactures of woollens, and an extensive view into the valley of the Liris, and towards Venafr in the valley of the Volturno. Monte San Giovanni has 3500 inhabitants

and manufactures of woollens and a brisk trade. Segni, the ancient Signia, is built on the ridge of the Lepini, with Cyclopean walls of four miles extent and seven gates, and the remains of an ancient temple now turned into a church; it is a bishop's see, and has 3500 inhabitants. Paliano, with 3000 inhabitants and a large baronial castle, was for a long time the residence of the powerful family of Colonna. All the above towns, besides several others with between 2000 and 3000 inhabitants, are situated at a short distance from each other, in or near the valley of the Sacco, along which runs the road from Rome to Naples, by San Germano, the ancient Via Latina. Foreign travellers, however, prefer the lower or Appian road by the Pomptine marshes, which is better; but the country is unwholesome and desolate. On the S. slope of the Mount Lepini, looking towards the Pomptine marshes, are Piperno, the ancient Privernum, with 3600 inhabitants; Sezze (Setia), 5300 inhabitants; Cori (Cora), with its fine temple of Hercules, its Cyclopean walls, and 4300 inhabitants; Sermoneta, with 2000; Norina, the ancient Norba, destroyed by Sulla, 1500 inhabitants. At the E. extremity of the Pomptine marshes, on the high road to Naples, is Terracina, the ancient Anxur, with some handsome modern buildings, many ancient remains, a bishop's see, and 4000 inhabitants, in the midst of a most luxuriant but unwholesome region.

Beyond the mountains E. of Terracina, which form the boundary of the Papal state, is the town and territory of Pontecorvo, in the valley of the Liris, and in the midst of the Neapolitan territories, but belonging by an old donation to the see of Rome. Pontecorvo has a population of 6500, a cathedral, and a long bridge over the Liris.

The Comarca or territory of Rome, which is under the jurisdiction of the governor of that city, has, besides the capital, the following towns:—Tivoli, with 5500 inhabitants. Subiaco, in the valley of the upper Anio, with a fine monastery of Benedictines, and the cave in which St. Benedict began his ascetic life; the town of Subiaco has 4800 inhabitants and some paper manufactures. Palestrina, on a hill, and with a wholesome climate; population, 4300. Frascati, one mile from the ancient Tusculum, and now one of the favourite country-residences of the Roman nobles and wealthy citizens; population, 4300. Albano, another place of resort; population, 5000. Genzano, on a southern offset of the Alban hill, surrounded with vineyards, which produce a pleasant light wine; population, 4000. Velletri, the ancient Velitrae, the birth-place of Augustus, a large town, built on the S.E. slope of the Alban mount, has some fine palaces and fountains, and 10,000 inhabitants; the country around is planted with vines. La Riccia (Aricia), with a fine palace of the Prince Ghigi, and a church by Bernini. Nettuno, on the sea coast, with the port of Anzo, Ardea, Civita Lavinia (the ancient Lanuvium, built upon a S. projection of the Alban hill, and quite distinct from Lavinium, the modern Pratica, which is near the sea shore, between Ostia and Ardea), Laurentum (now Torre Paterno), Ostia, are all decayed villages, with historical names and recollections.

The name of Campagna di Roma was adopted in the middle ages, to distinguish the country from the neighbouring Campania, or Campagna Felice, in the kingdom of Naples. The depopulation of the Campagna of Rome is often, though most erroneously, attributed to Papal misgovernment; it is an historical fact that it was nearly as desolate in the time of Cicero as it is now. The depopulation of the country dates from the early conquest by Rome of the various people who inhabited Latium; the long obstinate resistance of the latter, and especially of the Volsci, in consequence of which most of their towns were destroyed; the subsequent devastations by Sulla; and the custom of the Roman patricians to abandon their vast estates to the cultivation of slaves and the care of overseers. The lowlands near Rome are mentioned as unwholesome by Livy, Cicero, Strabo, Horace, &c. After the fall of the Western empire, the devastation of Latium became complete, and Rome, reduced to a population of less than 20,000 inhabitants, stood literally in the midst of a desert. After the return of the Popes from Avignon, in 1377, the population both of Rome and its territory began gradually to increase again. Since the pontificate of Sixtus V., 'the restorer of public peace and security' (1585-90), it has been steadily though slowly increasing. The two French invasions (1798-1809) checked this progress, and the population rapidly declined, but it has increased again since the restoration of the Papal

court and government in 1814. It is probably owing to the Papal government that Rome and the Campagna are not reduced to the condition of Babylon or Palmyra. No administration could render the lowlands of the Campagna healthy, or fix a population in them. Those provinces of the Papal state which enjoy a more salubrious atmosphere, such as Umbria, Perugia, the valley of Rieti in Sabina, the Marches, are among the finest, most populous, and best cultivated in all Italy. The whole of this question has been fully treated by Tournon, in his *Etudes Statistiques sur Rome*, in which he gives a minute description of the Campagna, and also in the *Foreign Quarterly Review*, No. xxi., Jan., 1833.

The cultivation of the plains of the Campagna is peculiar. Chateauneux (*Lettres écrites d'Italie*) was the first foreigner who examined it attentively and gave an accurate description of it. The farms are very large; some of them, such as that of Campomorto, contain above 16,000 acres. Some hundreds of labourers are engaged every year from the highlands for the service of one farm, between the months of October and June, and double the number at harvest time, after which they return to their hills, or come to the hospitals of Rome with the malaria fever. Many come 60 or 80 miles distance. During the summer months only a small number of permanent servants remain on the farms. This system of farming on a large scale is rendered necessary by the malaria, and the consequent depopulation of the plains. In the highlands and valleys of the Apennines property is much more subdivided, the farms are of moderate size, and most of the villagers have gardens and orchards or vineyards. (Chateauneux and Tournon.) The highest summits in the Campagna are—Monte Caciame, in the Lepini ridge, 3500 feet; Monte Cavo, in the Alban ridge, 3000; Maschio d'Ariano (Mons Algidus), an E. projection of the Alban, 2950; Monte Tuscolo, 2000.

CAMPAGNOLS. [MURIDÆ.]

CAMPAN, a valley and town in France, in the recesses of the Pyrenees. The valley of Campan is at the source of the Adour, and comprehends in reality two valleys, one of them watered by the Adour, and the other by the Traspors, a tributary of the Adour. The delightful scenery of the valley of Campan forms one of the attractions of the neighbouring watering place, Bagnères-de-Bigorre, the most frequented of this part of France. The mineral riches of the valley constitute however its chief claim to notice. It has granite and slate, but we are not aware whether these are quarried. It is from its marble that Campan derives its reputation. This is of different colours, some of purple and white with veins of green, and some of deep red veined with green and white. The grain of this marble is very fine, and the mass of it is of immense extent; it contains no marine fossil remains. It was quarried by the government of France before the revolution, and profusely employed in the embellishment of the royal residences; the beauty and vividness of its colours rendering it extremely suitable for the purposes of internal decoration. After the revolution, the works were for many years suspended, but the working of them seems to have been resumed.

The valley of Campan is one of the most fertile in the department (Hautes Pyrénées, Upper Pyrenees) in which it is situated; and the flocks, orchards, and gardens, which its inhabitants generally possess, enable them to live in comfort. The little town of Campan is on the left bank of the Adour, a short distance above Bagnères. Some woollen stuffs are woven, and there is a considerable manufacture of paper. Population, in 1832, 3015 for the town; 4171 for the whole commune.

The Pic du Midi de Bigorre, which overlooks the valley, rises to the height of 9544 feet.

CAMPAN, MADAME, was the daughter of M. Genet, an officer in the foreign department under Louis XV. She was born about 1750. At 15 years of age she was appointed reader to the princesses, daughters of Louis XV. In 1770 she married M. Campan, and was soon after appointed first lady of the bedchamber to Marie Antoinette, then dauphiness. She remained with Marie Antoinette during her husband's reign, and was with her in the first scenes of the Revolution, up to the storming of the Tuileries on the 10th of August, when she narrowly escaped with her life. Being forbidden to follow her mistress to her prison in the Temple, she retired into the country, and at last opened a boarding-school at St. Germain en Laye. The establishment prospered, and was patronized by Josephine

Beauharnois, who sent her daughter Hortense to it. In 1806, when Napoleon founded the establishment at Ecouen for the daughters and sisters of the officers of the Legion of Honour, he appointed Madame Campan to superintend it. After the restoration, the school of Ecouen being suppressed, Madame Campan retired to Mantes, where she died in March, 1822, leaving behind her a character for mild virtues and considerable information and accomplishments. She has written—*Mémoires sur la Vie privée de Marie Antoinette, Reine de France, suivis de Souvenirs et Anecdotes Historiques sur les Règnes de Louis XV. et Louis XVI.*, translated into English in 1823. She gives the most faithful and impartial account of Marie Antoinette. Her recollections of the old court of Louis XV. are also curious.

CAMPANELLA. [MEDUSA.]

CAMPANI, MATTHEW and JOSEPH, two brothers, natives of the diocese of Spoleto, were alive in and after 1678. They are sometimes confounded, as by Weidler for instance. Matthew, the elder, was curate of a parish at Rome, and applied himself to watchmaking and optics. He is mentioned as having constructed a clock which was illuminated by night from the interior, and he published a work on the subject of clockmaking in 1678. But he is principally known as having been the first who ground object-glasses of enormous focal length. By order of Louis XIV. he made one of a focal length of 130, one of 150, and one of 205 palms (9½ inches French, according to Auzout); and with one of these Dominic Cassini first saw the satellites of Saturn. His smaller glasses were much esteemed. Weidler says (of Joseph Campani, but we suspect it must be Matthew who is meant), on the authority of the *Journal des Savans*, 1665, p. 4, that he endeavoured to destroy chromatic aberration by means of a triple eye-glass. There is a paper of his in *Gaudentii Roberti Misc. Ital. Phys. Math.*, Bologna, 1692.

Joseph Campani was also an astronomer, and made his own telescopes. He published various observations (see Lalande, *Bibl. Astron.*), and is the one referred to in AUZOUT.

CAMPANIA, the ancient name of that part of the present kingdom of Naples which is now called Terra di Lavoro. The word Campania is probably derived from campus, 'a plain,' an etymology which Pliny (iii. 5) also assigns to the city of Capua, and which appears to us preferable to that given by Strabo, from caput, 'a head.' The Liris was the boundary between Campania and Latium. To the N. Campania was divided by the high Apennines from the country of the Marsi (the present Abruzzo), and to the N.E. by the Mounts Callicula, Tifata, and Taburnus from the country of the Samnites. A continuation of the same ridge between Abella, which was in Campania, and Abellinum, which was in Samnium, continued the boundary to the E. as far as the sources of the Sarnus. The off-set which there detaches itself from the same ridge, and runs in a W. direction, forming the peninsula of Curruntum, divided Campania from the country of the Picentini, the present province of Salerno. These were the limits of Campania under Augustus, when it formed one of the eleven regions of Italy. The limits of Campania were afterwards extended, and it was made to embrace the country of the Picentini, Beneventum, and also part of the E. Latium. Campania, as thus understood, is chiefly a plain enclosed between the sea and the mountains, which form a semicircular sweep from the mouth of the Liris to the promontory of Minerva. It was celebrated from the remotest times for its extraordinary fertility, and its soft and genial climate. The Osci, or Opici, and Ausones (probably all one people), are the first inhabitants of Campania recorded in history. Etruscan colonies afterwards spread to this country, and founded twelve cities, including Capua, which became the principal city of Campania. The Etruscans of Campania appear to have degenerated from their ancestors, and to have become licentious, insolent, and idle. The Etruscans were driven out or conquered by the Samnites, who finally yielded to the Romans. The cruel invention of the fights of gladiators, afterwards adopted by the Romans, and carried to a frightful extent, is attributed to the Campanians of Capua.

To prevent confusion as to the use of the term Campania, it should be observed that the district belonging to Capua was first called Campanus Ager, and this restricted and original meaning of the term should not be confounded with the

subsequent enlarged meaning of the term Campania, as used by Strabo for instance, and other writers after his time. The Campanians of Capua, after being allies of Rome, took the part of Hannibal, and were severely treated by the Romans in consequence. [CAPUA.] Livy (xxiii, xxv.) speaks at length of the Campanians, their manners, and the part they took in the second Punic war. Linternum, Teanum, Capua, Vulturum, Baiæ, Atella, Acerre, Abella, Nuceria, Nola, and the Greek colonies of Cume and Parthenope, or Neapolis (Naples), were all towns of Campania, in the enlarged meaning. The island of Capræ (Capri) was reckoned a part of Campania. The Vulturum was the principal river of Campania. (Strabo, p. 242, &c.) For a description of the country see TERRA DI LAVORO.

CAMPANILE, an Italian term signifying a tower for bells, or a church steeple. The word is derived from campana, 'a bell.' Many of the Italian churches have these towers or campanili separated from the body of the church. Among the most remarkable are those of Cremona, Florence, Ravenna, Padua, Bologna, and Pisa. Some of them are much out of the perpendicular, especially those of Pisa and Bologna. The Garisenda, built by the Garisendi, at Bologna, is 153 feet high, and 8 feet 6 inches out of the perpendicular. Dante has compared this tower to the inclined figure of Antæus. (Dante, *Inf.*, canto xxxi. l. 135.) The Asinelli tower, also at Bologna and close to the former, is 320 feet high, and 3 feet 6 inches out of the perpendicular. The leaning tower at Pisa is 150 feet high, and 13 feet out of the perpendicular. The campanile of Cremona is the highest in Italy, having an elevation of 395 feet. The campanile of Florence, which is 267 feet high, was constructed by Giotto in 1324, and is considered the most elegant campanile in Italy. The plan is a perfect square, 45 feet on each side. The interior is divided into six floors, each of which is vaulted. The tower is ascended by 406 steps. The façade of the tower is in the Gothic style, mixed with somewhat of the Italian taste in architecture, which soon after prevailed over the Gothic. It is said that Giotto intended to surmount this tower with a spire 85 feet in height. The cathedral at Seville has a fine campanile 350 feet high, which was built in 1568 by Guever the Moor. This tower is called La Giralda, from its brazen figure bearing that name. This figure, though it weighs a ton and a half, turns with the wind.

CAMPANULACEÆ, a natural order of monopetalous dicotyledonous plants, the character of which is to have an inferior three or more celled fruit, containing many minute seeds, combined with a regular corolla, distinct stamens equal in number to the lobes of the corolla, dilated bases to the filaments, a downy style, and a milky juice. It consists of plants usually herbaceous, sometimes shrubby, scat-

tered over all parts of the globe, but most abundant in the form of species related to the common campanula or bell-flower, in the milder parts of Europe and Asia. The flowers are commonly blue, purple, or white, occasionally rose-coloured, very rarely yellow, as in a Canary shrub called *Muschia Aurea*. None of the species are poisonous, notwithstanding that the order is very closely allied to the dangerous lobeliaceæ, which hardly differ except in having irregular flowers and syngenesious stamens. An excellent botanical account of this order was published by Alphonse De Candolle, under the name of *Monographie des Campanulées*. 4to., Paris, 1830.

[*Campanula rapunculoides*.]

1, the base of the corolla, with the stamens; 2, a stamen separate; 3, a lyx with the style and stigma; 4, a ripe seed vessel; 5, a section of the same; 6, seeds natural size; 7, a seed magnified; 8, a section of the same.

CAMPANULARIA. [SERTULARIÆ.]

CAMPANUS, JOHN, of Novara in the Milanese, the first translator of Euclid from the Arabic. Blaneus (*Chron. Math.*) places him between A.D. 1000 and 1100, but says that by his own account he wrote a calendar in the year 1200. Vossius confirms the latter, and cites the calendar in question, and also Blaneus in confirmation, without noticing the discrepancy. Riccioli contends for A.D. 1030. There is no doubt the writer of the calendar lived about A.D. 1200, but whether an earlier Campanus might not have been the translator of Euclid is a question. Tiraboschi (cited by Montucla) has shown that there was a Campanus who was chaplain to Pope Urban IV. (elected 1261), but we do not see on what grounds Tiraboschi positively affirms this one to have been the translator of Euclid.

This translation was the first printed, and we shall give an account of this early triumph of the art. There is no title-page; the first words being 'Preclarissimus liber elementorum Euclidis perspicacissimi: in artem Geometricæ incipit quæ felicissime: punctus est cuius pars non est,' &c. At the end we find 'Opus elementorum euclidis megarensis in geometriâ arte in id quoque: Campani perspicacissimi Cōmentationes finit. Erhardus ratdolt Augustensis impressor solertissimus. venetiis impressit. Anno salutis. M.cccc.lxxxij. Octavis. Calend. Julii. Lector. Vale.'

There is a preface by Ratdolt, in which he complains that among the vast number of books then printed at Venice, there should be so few on mathematics. This he attributes to the difficulty of representing diagrams, and states that he has discovered a method of printing them as easily as letter types. This appears to be wood-cutting; and the

[Campanile of the Cathedral at Florence, designed and built by Giotto.]

diagrams are on a broad margin, by the side of the black letter.

The translation itself is evidently from the Arabic, not from the Greek. Several Arabic terms are introduced; an equilateral rhombus is called *helmuyam*; a parallelogram, *similis helmuyam* in the definitions, but afterwards a *parallelogram*; a trapezium is *helmuariphe*. There was a reprint of Venice in 1491, not by Rattolt; and the commentary of Campanus was reprinted by Henry Stephens at Paris in 1516 in the edition of Zamberti. Billingsley's English translation, best known by John Dee's preface, was made from Campanus.

For a copious list of MSS. of Campanus in different libraries, &c., see Heilbronner, *Hist. Math. Univ.* (Index.)

CAMPBELL, GEORGE, author of several works of reputation, was born at Aberdeen in 1709. He relinquished the law for the purpose of studying divinity. In 1759, after having fulfilled pastoral duties since 1741, he was appointed Principal of Marischal College, Aberdeen. In 1763 he published his 'Dissertation on Miracles,' in reply to Hume's work on the same subject. It was translated into French and Dutch, and sold extensively. The degree of D.D. was soon afterwards conferred upon him by King's College, Aberdeen. In 1771 Dr. Campbell was appointed Professor of Divinity. In 1776 he published his most valuable work, the 'Philosophy of Rhetoric.' [BLAIR.] His last work was a 'Translation of the Gospels, with Preliminary Dissertations and Notes,' in 2 vols. 4to. He died in 1796, having resigned his professorship some years previously, on which occasion the king granted him a pension of 300*l.* a year.

CAMPBELL, JOHN, a writer on biography, history, politics, and statistics, was born at Edinburgh, March 8, 1708. At the age of five years he left Scotland, and never after visited it. He was placed in an attorney's office, but relinquished the law for a literary career. Before his thirtieth year he published (in 1736) 'The Military History of Prince Eugene and the Duke of Marlborough,' in 2 vols. folio. He was next engaged as one of the writers in the 'Universal History.' In 1739 he published the 'Travels and Adventures of Edward Brown, Esq.' 8vo.; in the same year 'Memoirs of the Bashaw Duke de Ripperda,' 8vo.; in 1741 a 'Concise History of Spanish America,' 8vo.; in 1742 'A Letter on the Discovery, Importance, and Utility of the Thurlow State Papers;' in the same year the 1st and 2nd vols. of the 'Lives of the English Admirals and other eminent British Seamen,' which work was completed by the appearance of two other volumes in 1744. This work, he says in a letter to one of his friends, cost him a great deal of trouble, and he endeavoured to be strictly impartial. Three editions were published in his lifetime. In 1744 he published in 2 vols. folio a collection of 'Voyages and Travels' on an improved plan. In 1745 he commenced his labours in the 'Biographia Britannica.' Dr. Kippis, his coadjutor in this work, passed a high encomium upon the part taken by Mr. Campbell, and attributed much of its success to him. He wrote the 'Introduction to Chronology,' and the 'Discourse on Trade' in Dodsley's 'Preceptor.' In 1750 he published a work 'On the Present State of Europe,' which met with great success. His most important work was published in 1771, in 2 vols. royal 4to., and is entitled 'A political Survey of Britain, being a series of Reflections on the Situation, Lands, Inhabitants, Revenues, Colonies, and Commerce of this Island, intended to show that we have not as yet approached near the summit of improvement, but that it will afford employment to many generations before they push to the utmost extent the natural advantages of Great Britain.' Dr. Kippis enumerates sixteen or seventeen other works of a less important character by Dr. Campbell. In 1754 the degree of LL.D. was conferred upon him by the Glasgow University; and in 1774 the empress of Russia presented him with her picture. Dr. Campbell married in 1736, and died Dec. 28, 1775. He was interred in the burial ground of St. George the Martyr, near the Foundling Hospital, London, where a monument was erected to his memory. Only one child, out of seven which he had, outlived him. In 1785 he was appointed by the government his majesty's agent for the province of Canada, which office he retained until his death.

CAMPBELLS, LORDS OF ARGYLL. They trace their lineage to an individual of their name who in the 12th century married the daughter of a Gaelic chieftain and got with her the lordship of Lochow in the shire of Argyll. A few descents bring us down to Gillespie Campbell, laird of

Lochow, who witnessed a charter of King Alexander III. in the year 1266, and whose son and heir, COLIN CAMPBELL of Lochow, surnamed the Great from his stature, received the honour of knighthood from the same king. This Sir Colin was, in 1291, one of the nobles of Bruce, when the title of the latter to the crown was to be investigated before King Edward I. He was soon afterwards killed in a conflict with the lord of Lorn; and as his sons also assisted Bruce in crushing that powerful lord, they shared largely in his forfeited estates,—on his ruins indeed the family rose to the chieftainry of Argyll. Sir NIXL CAMPBELL of Lochow, son of the said Sir Colin, was further rewarded with the hand of the Princess Mary, sister of Bruce, by whom he had Sir COLIN CAMPBELL of Lochow, who retook for King David Bruce the castle of Dunoon, and was, in consequence, appointed heritable keeper thereof. His great-grandson, Sir DUNCAN CAMPBELL of Lochow, who was one of the hostages for the return of King James I., was by that prince constituted one of the privy council and afterwards justiciar and lord-lieutenant of the shire of Argyll. In these offices he was continued by King James II., who also made him a lord of parliament by the title of Lord Campbell, and on his death advanced his grandson COLIN, second Lord Campbell, to the dignity of Earl of the county of Argyll.

In 1463 his lordship was joined in a commission to treat a truce with England; and soon after his return he was made master of the household, and in 1465 associated with Lord Boyd in the high office of lord justiciar south of Forth, which he exercised alone from 1469 to 1475, when he was sent as a plenipotentiary into England. He was some time afterwards sent ambassador to France to renew the league with that crown; and on the death of Bishop Livingstone was, in 1483, made lord high chancellor of the kingdom, in which post he remained till the spring of 1488 when he was sent into England on a public embassy.

On the accession of King James IV., in June that year he was reinstated in the chancellorship, and so continued till his death in the beginning of 1493. His son ALEXANDER, second Earl of Argyll, commanded the vanguard of the Scots army at the battle of Flodden, and fell there with the king and many others. His son COLIN, third Earl of Argyll, was soon afterwards appointed one of the four counsellors to King James V., from whom he also got a grant of the lordship of Abernethy, then in the crown by forfeiture, and thereafter a confirmation of the hereditary sheriffship of the shire of Argyll. He was also appointed to the high office of lord justiciar of Scotland, an office which remained thenceforward for a century hereditary in his family. He died in 1542, and was succeeded by his eldest son ARCHIBALD, fourth Earl of Argyll, who is memorable as the first person of consequence in Scotland who embraced the Protestant religion. He was twice married; and his sons ARCHIBALD, fifth Earl of Argyll, and COLIN, sixth Earl of Argyll, by separate marriages, were severally lord high chancellors of Scotland, but neither of them was otherwise remarkable: the latter indeed is described in a contemporary pamphlet as 'religious and of good nature, but weak in judgment, and very much held by his wife.' His son ARCHIBALD, seventh Earl of Argyll, was a military officer of considerable reputation; and, marrying twice, was the father of two very distinguished sons. The younger of these was, in 1622, created Lord Kintyre; but having no issue, the title expired at his death. The elder, ARCHIBALD, eighth Earl of Argyll, was born in the year 1598, and from his earliest years was noted for his piety and devotion. In 1628, when his father was abroad, having left the kingdom, the Lord Lorn resigned into the king's hands his hereditary office of lord justiciar, or, as it came to be styled, justice-general of Scotland.

In 1633, the Earl of Argyll having declared himself a convert to the Roman Catholic faith, was obliged to make over his estates to his son, reserving only a suitable maintenance to himself; and the following year Lord Lorn was appointed by the king one of the extraordinary lords of session. In the month of April, 1638, when the national covenant was framed and sworn to by nearly the entire population of Scotland, he was called up with others to London to give advice to the king under the existing circumstances of the kingdom; and though they were all equally aware that the covenant was obnoxious to the king, yet Argyll spoke freely and honestly, and recommended the abolition of those innovations which his

had made on the constitution of the Scottish church. He returned to Scotland on the 20th May; and on his father's death, the same year, succeeded to all his honours and possessions. He attended the meeting of the general assembly at Glasgow that year, and there openly joined the church against the court. It was at this assembly that the oppressive policy of two reigns was subverted, episcopacy abolished, and presbyterianism established. To repress the rising of the M'Donalds and the Earl of Artrim, in aid of the invasion of Scotland by the royalists, which afterwards followed, Argyll proceeded to his own country, where he raised a force of 900 of his vassals, part of which he stationed in Kintyre, part in Lorn, and with the remainder he passed over to Arran, which he secured by seizing upon the estate of Brodie: this rendered the attempt on the part of the Irish at that time nearly impossible. On the resumption of hostilities, after the short pacification of Berks, he traversed, with a force of about 500 men and a small train of artillery, the districts of Badenoch, Athol, and Mar, levying the taxes imposed by the estates of Scotland and enforcing submission to their authority.

When the king came to Scotland in 1641, with a view to a settlement of the kingdom, Argyll was qualified by his learning and talents, no less than by his services, for the post of first chancellor, then vacant, but the king was afraid to aggrandise one already so powerful, and the place was bestowed on Lord Loudoun. Argyll, however, was created a marquis, by the title of Marquis of Argyll. In the disturbances and civil war which soon afterwards followed, Argyll took, as before, an active part; but circumstances occurred of a personal nature which made him throw up the commission which he held from the Estates as general of the army; and in February, 1646, he was sent over to Ireland to bring home the Scots troops which had been directed thither to assist in repressing the turbulence of the Catholics. He returned in May following; and in the month of July in the same year, when the king had summoned himself to the Scottish army, Argyll went to

Edinburgh to pay his respects to him, and he was afterwards employed in the conference with the parliament of England on the articles presented by the Estates to the king. He took also a leading part in the installation of Charles II., on whose head he placed the crown at Scone on January 1, 1651. He submitted, however, to the subsequent usurpation of Cromwell, and under Richard sat in parliament for the county of Aberdeen. For these compliances he was at the Restoration indicted for high treason, and being convicted he was beheaded on Monday, May 27, 1661. His attainder was justly imputed to the enmity, and his precipitate execution to the impatience, of Middleton, who anxiously wished a gift of his titles and estate; and it is nearly certain that the noble family of Huntley was saved from utter ruin only by these events: that family stood indebted to Argyll in a very large sum, and from 1653 to 1661 Lord Argyll actually his residence in Gordon castle.

* The lord we have now mentioned was ARCHIBALD, ninth Earl of Argyll, eldest son of the marquis, having been restored to the estate and title of Earl of Argyll in 1663. He shared also largely in the profits and preferments which followed on the king's restoration: but having taken the Test of 1681 with this explanation, that he took it as far as it was consistent with itself and with the Protestant faith, he was accused by a bold and flagitious cabal of treasonable leasing making, tried, and condemned. He made his escape from confinement, however, in the train of his step-daughter, Lady Sophia Lindsay, disguised as her page, and escaped to Holland. He afterwards returned, and, at the head of a considerable force, made a descent into Argyleshire; but being made prisoner, he was executed, on a single day's notice, on his former sentence. His own son, who had some time before been granted him out of his father's forfeited estates, offered to serve in the royal army against his father when he invaded Scotland previous to his execution. This son was ARCHIBALD, tenth Earl of Argyll, so acknowledged by parliament before the reversal of his father's attainder. He also sat in the Convention of 1689 as such; and was one of the commissioners deputed by the Estates to offer the crown of Scotland to the Prince of Orange, and to tender the coronation oath. The next year he was made a lord of the treasury, and in 1694 an extraordinary lord of session. In 1696 he was appointed colonel of the

Scots Horse Guards; and afterwards raised a regiment of his own clan, which greatly distinguished itself in Flanders. On the 23rd June, 1701, he was created Duke of Argyll; and dying in September, 1703, was succeeded by his eldest son JOHN, second Duke of Argyll, who was thereupon sworn of the king's privy council, appointed captain of the Scots Horse Guards, and, though scarce twenty-five years old, raised to the seat occupied by his father as an extraordinary lord of session. This last place, however, he not long afterwards resigned in favour of his brother, ARCHIBALD Campbell, then lord high treasurer of Scotland, who, in the end of 1706, was created Viscount and Earl of Ilay, for his services in furthering the Union with England. For the like services Argyll had, in 1705, been created an English peer, by the titles of Baron Chatham and Earl of Greenwich. His grace after this served four campaigns under the Duke of Marlborough in Flanders, where he rose to the rank of lieutenant-general, and honourably distinguished himself in the battles of Ramillies, Oudenard, and Malplaquet, and at the sieges of Ostend, Meenen, Lisle, Ghent, and Tournay. On the change of ministry in 1710 he joined the court, and was appointed generalissimo in Spain; and on the same occasion his brother, the Earl of Ilay, was made lord justice-general of Scotland for life. On his Grace's return from the continent he changed his political party again, and was in consequence deprived of his government offices. When the Hanover family attained the throne, he was appointed commander-in-chief of all the king's forces in Scotland; and in repressing the rebellion of 1715 behaved with great energy and decision. On the 13th April, 1719, he was advanced to the dignity of Duke of Greenwich. After several changes in the political world he retired from public life, and died on September 3, 1743, when, leaving no male issue, his English titles of Duke and Earl of Greenwich and Baron Chatham became extinct. His other titles passed to his brother already noticed, ARCHIBALD, Earl of Ilay, and third Duke of Argyll. By these two brothers, as has been well remarked, the views of a certain party in Scotland at the Union to perpetuate their authority over their countrymen were actually realized, the whole kingdom having become subject to them through the servility of the few members which Scotland long returned to parliament. The latter, indeed, had the affairs of Scotland so entirely at his disposal, that he obtained the appellation of King of Scotland. He died on the 15th April, 1761, and, leaving no issue, his own immediate honours became extinct, while those of his family descended to his cousin.

CAMPBELLTOWN, a burgh and port in Argyleshire, near the southern extremity of the long narrow peninsula which, under the name of Cantire or Kintyre, projects into the Irish channel. It stands on a loch or indentation of the coast, which forms an excellent harbour, about two miles long and one broad, with from six to thirteen fathoms water. Campbelltown is 65 miles due W. by S. from Glasgow. It was formerly a burgh of barony, and was created a royal burgh in 1700. The town lies principally on the south-western side of the harbour; but it is extending round the head of the loch towards the north-eastern side. There are good quays, to which, if extended a few yards farther, ships of any burden might come with safety at all times of the tide on both sides of the harbour. The intercourse between Campbelltown and the mainland, particularly with Glasgow and Ireland, has been much increased by steam navigation.

The principal part of Campbelltown is built on the property of the duke of Argyle. The parliamentary boundary of the burgh is extensive, and comprehends a large quantity of land not built on, on both sides of the loch. In conjunction with Ayr, Irvine, Inverary, and Oban, Campbelltown returns one member to parliament.

The chief trade is in whiskey. In 1832 there were fifteen distilleries, which produced upwards of 60,000℔. per annum to the excise. There are coal mines about four miles from the town, and a canal, by which the coal is conveyed. In addition to the trade in whiskey, considerable quantities of potatoes are exported, chiefly to Ireland. The principal imports are barley from Ireland, and coals from Glasgow and Ayrshire. The population of the burgh in 1831 was 4,869. (*Boundary Reports*.)

CAMPEACHY, a town in the state of Yucatan, which is one of the members of the Mexican Union. It is situated on the W. coast of the peninsula of Yucatan, on that portion of the gulf of Mexico which is sometimes called the

Bay of Campeachy, but more appropriately the Bay of Vera Cruz. The former name properly belongs to that smaller and open bay on which the town is built. Campeachy is in 20° N. lat., and 90° 30' W. long. Vessels cannot enter the mouth of the Rio S. Francisco, on which the town is built, but must remain in the bay at a considerable distance from the shore. The town contains about 18,000 inhabitants, and is defended by a fort. Its exportations consist of Campeachy-wood and wax. The wood is cut in several places, especially on the banks of the Rio Chamela, S. of the town; and the wax is got from the wild bees without stings, which are common in the country to the east.

CAMPER, PETER, was born at Leyden on the 11th of May, 1722. His father, Florent Camper, was a clergyman, who numbered among his friends Boerhaave, 'sGravesande, Mussehenbroeck, and Moor; and it was in the society of these celebrated men that Camper spent much of his youth, and imbibed that love of science and the fine arts for which he was afterwards distinguished. He was instructed in drawing by Moor, and in geometry by Labordes. On entering the university of Leyden he devoted himself with unwearied assiduity to the study of medicine, under Gaubius, Van Rooyen, the elder Albmus, and Triaen. Under these masters he soon rose to distinction; and when he took his degree of doctor in philosophy and medicine in 1746, he published two dissertations,—the one 'De Visu,' the other 'De Oculi quibusdam partibus,' which have been much praised by Baldinger. In 1748 he visited London, where he associated with Mead, Pringle, and Picaurn, and where his taste for natural history was awakened by the cabinets of Sir Hans Sloane and Collinson, and the collections of Hill and Catesby. He spent nearly 12 months in England. On his return he successively occupied the chairs of philosophy, anatomy, surgery, and medicine in the universities of Franeker, Amsterdam, and Groningen. When entering upon these professorships he delivered introductory lectures, which were remarkable for the comprehensive knowledge which they evinced in physics, medicine, and anatomy, as well as for an uncommon talent of observation. He obtained a prize from the Academy of Sciences in 1772, and an *accessit* in 1776; a prize from the Academy of Dijon in 1779; from that of Lyons in 1773, and that of Toulouse in 1774; and from the societies of Haarlem and Edinburgh, and the academy of surgery. He was a member of the Academies of Berlin and Petersburg, and of the Royal Societies of London and of Göttingen; and in 1785 was made a foreign associate of the Academy of Sciences at Paris, being the only Dutchman, except Boerhaave, who had attained that honour. He was also a member of the state-council of the United Provinces, and a deputy in the assembly of the States of the Province of Friesland. He died of a violent pleurisy on the 7th of April, 1789, in the 67th year of his age, leaving behind him the well-earned reputation not only of a distinguished anatomist and philosopher, but of an honest man. His works, or rather detached essays, are exceedingly numerous. Besides his 'Demonstrationes Anatomico-pathologicae,' of which two parts only appeared, the one containing the structure and diseases of the human arm, the other the structure and diseases of the human pelvis, he published separate dissertations upon the following subjects:—on 'the cause of hernia in new-born children;' on 'the sense of hearing in fishes;' on 'the physical education of children;' on 'inoculation for the small-pox;' on 'the origin and colour of negroes;' on 'the signs of life and death in new-born children;' on 'infanticide, with a project for the establishment of a foundling hospital;' on 'the causes of infanticide and suicide;' on 'the intromission of air into the lungs of new-born children;' on 'the operation of lithotomy at two different times according to the celebrated Franco' (that is, on the first day the surgeon makes the incision into the bladder, the patient is then to be put to bed, and the extraction of the stone is deferred to the second, third, or fourth day); on 'ulcers in the urethra, &c.;" on 'the orang-outang and other kinds of apes;' on 'cancers, &c.;" on 'lameness in infants;' on 'lithotomy;' on 'the classification of fishes according to the system of Linnæus;' and on 'the fracture of the patella and olecranon.' He also presented the following memoirs to different societies: on 'the callus of fractured bones;' on 'the advantages and best mode of inoculating for the small-pox;' on 'the theory and treatment of chronic diseases of the lungs, &c.;" on

'the construction of crasses, and the best method of tempering steel for these instruments;' on 'the structure of the great bones of birds, and the manner in which atmospheric air is introduced into them;' on 'the cure of ulcers;' on 'the characteristic marks of countenances of different countries and ages,' which was first published by his son in 4to. in 1791, and afterwards by the description of a method of delineating the features of heads with accuracy; on 'the diseases of the glands, in the interior of the sternum;' on 'contagious diseases among cattle;' on 'specific remedies;' on 'the effects of air, sleep, &c. in the cure of surgical disorders;' on 'the nature, treatment, &c. of dropsy;' on 'physical beauty;' on the question, 'Why is man exposed to more diseases than other animals?' and on 'the fossil bones of unknown and rare animals.' In 1792 his son published a sequel to the work on the countenance, and features, &c. entitled 'Lectures of the late Pet. Camper on the manner of delineating the different emotions of the countenance,' &c.; and in 1803 a collection of his works appeared at Paris in 3 vols. 8vo. with a folio atlas under the title of 'Œuvres de Pierre Camper, dont pour objet l'Histoire Naturelle, la Physiologie, et l'Anatomie Comparée.' His 'Icones Herniarum' was published at Frankfort by Socmmering, 1801, folio. Among the prominent points in his works, we may mention his discovery of the presence of air in the bones of birds; his demonstration that the curvature of the urethra is greater in children than in adults; his remarks on the variation of the angle in different nations; his account of Rozenhuyzen's lever, used in the practice of midwifery; his dissertation on the best form for shoes; and his osteological investigations into lost races of animals.

CAMPHOR is the stearopten, or one of the phlogistons arising from the separation of the volatile oil of two trees, the one, *Cinnamomum Camphora* (Nees v. Esenbeck), native of Japan, China, and Cochinchina; the other, *Dipterocarpus Camphora*, or *Dryobalanops Camphora* (Colebrooketia), a native of Borneo and Sumatra. From these it is produced by different processes. It exists in every part, root, stem, branches, and leaves, of the first-mentioned tree, which is chopped into pieces sufficiently small to be thrown into vessels: these vessels are afterwards covered with earthen hoods, in which are placed rice-straw and rushes, heat being subsequently gradually applied. The camphor is volatilized, and afterwards condenses on the straws, rushes, &c. This, after being purified from the intermixture of straws, is found in commerce under the name of crude camphor. But it still retains many impurities, and on arrival in Europe is refined, formerly exclusively at Venice, now also in England and Germany.

From the *Dipterocarpus Camphora* it is not procured by distillation, but exists in a solid form in the stem of the tree. In that part of the stem which should be occupied by the pith it is found along with camphor oil. When tapped or opened while young nothing but oil is obtained, but on time a great quantity of this oil assumes the solid form, and is found at intervals along the trunk in pieces a foot or a foot and a half long. The process of extracting the oil is effected by means of a Malay axe used to lay open the trunk at about six inches from the ground, till near the heart, when a small incision is cautiously made, and the oil if present gushes out, and is received into bamboos or other vessels. If camphor is suspected to be present the tree is felled, cut into pieces about a fathom long, which are then split, and the camphor is found in pieces of the length stated, and about the circumference of the human arm. A tree of moderate size may yield about 11 pounds, while a very large one may produce twice that quantity. The camphor obtained is called So Tantong or head camphor; but the camphor which surrounds the camphor on being scraped yields an inferior sort, called belly and foot camphor. The camphor from this tree is much less volatile and transparent than the former.

The oil is much prized and used in the East, but is not sent to Europe. So much more is the Borneo and Sumatra camphor esteemed than the other, that, even in the markets of Japan, 200 pounds of the camphor of the latter country will be given in exchange for one pound of the former. The Bornean camphor is white like milk, but has the same smell and taste as that of Japan.

The process of refining consists in exposing the camphor in large earthen flat glass baskets, along with a little char

coal, caustic lime of chalk, during which the Sumatra camphor diffuses an odour like violets. Refined camphor is in round cakes, convex externally, concave internally, generally with a hole in the centre, each weighing about two pounds. The cakes are wrapped in strong blue paper, and exported in barrels weighing about 500 pounds, containing 250 or 300 cakes.

Camphor is an organic substance of a peculiar kind, representing the volatile oils in a solid state. It differs from them, however, not being solid at the ordinary temperature of the air, but not being converted by the oxygen of the air into a resin. It is so volatile that on exposure to the air it is entirely volatilized, and leaves no residuum. It has anunctuous feel, possesses considerable tenacity, and is not easily powdered, without the addition of alcohol, ether, or the Sumatra camphor however can be powdered without aid. It is nearly insoluble in water (requiring 530 parts for its solution), but very soluble in alcohol, the ether, eupion, crocote, the empyreumatic, volatile and fixed oils. It is precipitated from most of its solutions, in an unchanged state, on the addition of water. Its specific gravity is 0.985; its ultimate composition is, according to Blanford and Sell,

Carbon . . .	79.28
Hydrogen . . .	10.34
Oxygen . . .	10.37

At 28° of Fahrenheit's thermometer it melts, at 400° it is easily ignited, burning with a bright flame and much smoke, but leaving no residuum. Its odour is strong and peculiar, its taste aromatic but bitterish, leaving behind a feeling of coldness in the mouth.

Camphor acts upon the animal frame, both in the state of vapour and in the solid state. Few insects can endure the pungent odour of camphor; and in combination with strong acetic acid it acts as a powerful stimulant in cases of a disposition to fainting. When six or eight grains are introduced into a stomach in which there exists no increased sensibility, the person also not being in a state of excitement, the first effect is a feeling of burning and warmth, which gradually extends from the epigastrium over the whole body, occasionally accompanied with unpleasant feelings in the stomach, such as slight pain, cructations, &c. The pulse soon rises, becomes fuller and undulating; the heat of the skin is gently increased, and a warm and gentle but regular perspiration follows. All muscular actions take place with more ease: the nervous system in its whole range is roused and strengthened, and a feeling of general comfort pervades the whole frame. In from one to three hours this state abates, without leaving sleepiness, lassitude, or any unpleasantness behind.

A larger dose, half a drachm or two scruples, causes a burning heat in the palate and stomach, with pain, disposition to vomit, and great disturbance of the nervous system (the severity of which is determined by the amount of action on the stomach). There is heaviness, sense of constriction in the head, ringing of the ears, flickering of objects before the eyes, errors of vision, tremblings of the limbs, and impossibility of maintaining the erect posture, or of walking. During the continuation of this state, shiverings, with paleness of the skin and countenance, diminished warmth of skin, a slow, feeble, and contracted pulse, a laborious respiration, and threatenings of faintings or convulsions exist. When death results, the stomach is discovered to have been the seat of violent inflammation. Camphor may therefore be regarded as a powerful stimulant, at first local, but afterwards extending to the brain, spinal chord, and ganglionic

It is useful in the low or sinking stage of almost all fevers, particularly where the nervous system is much depressed. At an earlier stage of the same disease, along with antimony or opium, it often has a very beneficial effect on the skin, promoting regular and warm perspiration. It has also been used along with nitrate of potassa during the interval of an intermittent fever, to prevent a return of the paroxysm. In exanthematic fevers, such as small-pox, measles, scarlet fever, &c., it is often very serviceable during the eruptive stage, when the eruption does not come out freely, from want of sufficient nervous energy. In such circumstances, camphor, in the form of serpentaria, it is superior to any other means.

In chronic nervous diseases, such as epilepsy, St. moy to

similar disorders, it is often a valuable agent or vehicle for other remedies. Its external application as a rubefacient, in cases of cramps and neuralgic pains, is often of great service.

In many cases of irritability of the urinary organs it is useful.

It is administered either in powder, in which case it must be minutely divided and mixed with other substances, or in aqueous solution (a very feeble preparation, though it possesses the odour), or alcoholic solution. When it is dissolved in oil, it forms a useful application to joints and other parts suffering from chronic rheumatic pains.

The use of camphor in the form of vapour from a bag carried round the neck, as a prophylactic during the prevalence of epidemic fevers, is hurtful. It produces depression of the nervous power, muscular debility, difficulty of respiration, and favours the very action of the morbid agent which it was intended to prevent. Its employment even in museums to protect the objects from insects, and among clothes to ward off moths, is injurious, if much be volatilized and diffused through the apartments.

Camphor exists in several plants and trees besides those above mentioned; and a substance resembling camphor, and generally considered to be such, can be procured from many plants. It is in most cases, however, a hydrate of volatile oil, such as the Coumarin or odorous principle of the Tonka bean, Helenin from the Inula Helenium. An artificial camphor may be prepared by the mutual action of hydro-chloric acid gas and oil of turpentine: it is white; possesses a camphor-like odour, is soluble in alcohol, &c.

CAMPBOR-TREE. [LAURACEÆ, and DIPTEROCAR-
PUS.]

CAMPBOR-OIL. a substance obtained in Borneo and Sumatra, from the *dryobalanops camphora*. It is supposed to be camphor in an imperfect state of formation.

CAMPBORIC ACID. This acid is obtained by heating camphor in a retort, with seven times its weight of nitric acid of sp. gr. 1.25; the acid which distills into the receiver is to be returned to the retort, until nitric oxide ceases to be evolved. In this operation no carbonic acid is formed. During the cooling of the contents of the retort, camphoric acid crystallizes, which is to be purified by repeated solution in boiling water and by crystallization. This acid is sometimes in small scales, and at others in needle-formed crystals. It is colourless; its taste is at first weak, but is afterwards acid, and finally bitter. At usual temperatures it is inodorous, but when gently heated, it exhales a smell of camphor, which eventually becomes penetrating and acrid. At about 100° Fahrenheit it vaporizes, and at 145° it fuses into a colourless fluid, which crystallizes on cooling. At a higher temperature, a portion of the acid sublimes unchanged; the mass becomes gradually deeper coloured, swells, yields empyreumatic oil and a small quantity of empyreumatic water, and charcoal is left; the products of distillation contain, however, camphoric acid to the last.

One hundred parts of water at 202° dissolve 12 parts of camphoric acid, and at 56°, 1.13 parts. It is much more soluble in alcohol, 100 parts taking up 121 at 144°, of which about 110 remain in solution on cooling. It is also soluble in ether; and hot oil of turpentine also dissolves it, but the greater part crystallizes on cooling.

According to Liebig, camphoric acid is composed of

Five equivalents of oxygen =	50.0000	36.82
Fifteen " hydrogen =	9.3597	6.89
Ten " carbon =	76.4370	56.29

Camphoric acid unites with salifiable bases to form salts called *camphorates*. Not one of them is applied to any purpose whatever. Those which are soluble have almost all of them an aromatic bitter taste; the aqueous solutions are decomposed by the stronger acids, and they all burn and are decomposed by heat.

CAMPBOR FORMIO, a village four miles S.W. of Udine, in the Venetian province of Friuli, on the high road to Treviso and Venice. It is celebrated for the treaty of peace concluded here, 17th October, 1797, between General Bonaparte, in the name of the French republic, and Count Cobentzel and General Meerfeld, the Austrian plenipotentiaries. By that treaty the emperor of Austria resigned Lombardy and Flinders, and received the Venetian States

as a compensation. During the negotiations Bonaparte's headquarters were at Passeriano, a few miles from Campo Formio, near the banks of the Tagliamento. [BONAPARTE.]

CAMPOMANES, COUNT PEDRO RODRIGUEZ, a distinguished Spanish civilian and statesman of the 18th century. In 1765 he was appointed fiscal advocate to the royal council of Castile, and was made afterwards minister of state. He was a friend of Aranda, and took part in the expulsion of the Jesuits by that minister. [ARANDA.] He laboured zealously to rouse the industry of Spain from its state of torpor, and wrote several good works on the education of the people, and especially of the artisans. Under the ministry of Florida Blanca, Campomanes was removed from the council, and lived afterwards in retirement until his death which took place towards the beginning of the present century. He was director of the Spanish academy of history, one of the few useful learned institutions of Spain, and was also a member of the Academy of Belles Lettres of Paris, and of the Philosophical Society of Philadelphia. His principal works are: 'Antigüedad Marítima de la República de Cartago,' with a translation of the 'Periplus of Hanno,' illustrated by copious notes, 4to. Madrid, 1756. 'Discurso sobre el Fomento de la Industria Popular,' 8vo. Madrid, 1774. 'Discurso sobre la Educacion Popular de los Artesanos, y su Fomento,' 8vo. Madrid, 1775. In this last treatise he combated the idea, then general in Spain and most other countries of the continent, that mechanical professions were in their nature low and abject. He contended that they were considered as such because they were kept in a state of depression and degradation through the ignorance and indolence of those who exercised them in a slovenly manner. 'Let the mechanical arts be improved and ennobled by the assistance of education and scientific knowledge; let the artisans raise themselves by their skill, industry, and conduct, and the prejudice against the mechanical professions will give way.' These propositions of Campomanes appear now self-evident, but in his time, and especially in Spain, they sounded like a paradox, and it required a considerable degree of moral courage to assert them. As a continuation of the same subject, Campomanes wrote, 'Apendice a la Educacion Popular,' 4 vols. 8vo. Madrid, 1776-7. The first volume treats of the origin and decay of industry in Spain during the 17th century, with numerous quotations from writers of that age, and contains much interesting statistical and historical information on the internal state of Spain in that obscure period. The second volume treats of the means of encouraging and improving manufactures, and quotes the various royal decrees, ordinances, and privileges, issued at different times for that object, though apparently to little purpose. The third volume treats of the laws concerning the artisans, and especially of the municipal and corporate regulations, with extracts from foreign authors, especially French, on the manner of conducting various branches of manufactures. The fourth volume contains eight 'discursos' or dissertations on the public economy of Spain, by Francisco Martinez de Mata, a friar from Granada who lived about the middle of the 17th century, and whose writings had fallen into oblivion, and are not even mentioned by Nicolao Antonio in his 'Bibliotheca Nova.' They are interesting, considering the time in which they were written. Campomanes adds his own notes to them. Campomanes wrote also an historical dissertation on the order of the Templars, and a treatise on the mortmain property possessed by convents and other ecclesiastical bodies, in which he expressed opinions which drew upon him the hostility of several powerful dignitaries of the church, and probably contributed to his removal from office.

CAMPONTIA, a genus of marine annelides, separated by Dr. Johnston, and described by him in the 3rd vol. of the 'Zoological Journal,' p. 325. In the 8th vol. of the 'Magazine of Natural History,' p. 179, where a figure and enlarged description of the animal are given. Dr. Johnston says, 'When I first described this animal, its close resemblance to some caterpillars was particularly mentioned, but the suspicion of its being actually a larva did not occur to me; for I believed it to be an established fact among entomologists that no insect passed its preparatory stages in sea-water. I have been informed, however, that Mr. Mac Leay, and no higher authority can be given, has proved that the worm in question is the larva probably of some dipterous fly; and if this opinion is correct (which its anatomy strongly confirms), then it will follow that at least one larva

naturally lives and undergoes its change in the sea; a conclusion which, I think, is one of some importance and at variance with our present notions. Our campontia cruciformis may be found at all seasons, at the roots of sea-weed and corallines, in pools left by the recess of the tide. The very specimens before me were procured by myself, a few days ago, in parts to which no fresh-water could have access, and which are covered to the depth of several feet every tide, for they are near low-water mark.'

CAMPSPIA (*Lepeletier and Serville*), a genus of coleopterous insects, of the section Heteromera, sub-section Stenoclytra (*Latreille*), and family Helopidae. Generic characters:—Head broad; antennae with the five terminal joints slightly serrated; body elongate. [HELOPIDÆ.]

CAMPSIE HILLS, in Scotland, extend between the lower courses of the rivers Forth and Clyde, in a general direction from E.N.E. to S.S.W. They occupy the middle portion of the county of Stirling and the S.E. part of that of Dumbarton. More than one-third of Stirlingshire is covered with the Campsie and the valleys belonging to them, but only a small part of Dumbartonshire.

The Campsie Hills are not connected with any mountain-range of Scotland. To the S. of them extends the plain, through the N. portion of which the Forth and Clyde Canal runs; and at their most western extremity they are separated from the hills of Renfrewshire, which terminate E. of Port Glasgow, by the wide and deep bed of the Clyde. They are separated from the mountains skirting the banks of Loch Lomond on the W. by the valley of the Leven. The mountains S.E. of Ben Lomond also are detached from them. From Buchanan, near Loch Lomond, a plain, with an average width of four or five miles, extends to the banks of the Forth, at Kippen. This plain, in its highest parts, is hardly more than 200 feet above the sea. Farther E., the valley of the Forth divides the Campsie Hills from the high summits in Perthshire and the S. extremity of the Ochil Hills.

The rock on which the Castle of Dumbarton stands, close to the Clyde, is the most S.W. extremity of the range; but the rock of Stirling Castle is its most N.E. point. At nearly an equal distance from both these rocks are the Campsie Fells, the highest portion of the system, which rise to more than 1500 feet above the sea. In these hills the sources of the Carron, the Endrick, and the Glazert are interlocked. From this point the Campsie Fells branch off W. and E., and continue about twelve miles in each direction, ending on the W. near Killearn. On the E. the range divides into two ridges, which enclose the valley of the Carron, till both terminate somewhat more than one mile above Denny. The southern ridge is the higher, and rises in some points to 1350 feet; the northern, which is much lower, separates the valley of the Carron from the hills about the sources of the Bannockburn.

Where the sources of the Endrick and Carron are interlocked, a ridge branches off in a N.E. direction, and continues to the banks of the Forth, at Trench, a distance of about ten miles. The rocks of Craigfarrar and Stirling may be considered as belonging to it and constituting its extremity. This ridge, which is called Dundaff Hills, occupies in width as much space as the Campsie Fells, but its height hardly ever reaches 1000 feet.

At the source of the Glazert another ridge of high land branches off from the Campsie Hills, which for four or five miles runs S.W., but then declines to the W., in which direction it continues for about ten miles, till it terminates about a mile from the banks of the Leven, opposite Bonhill. These heights, which are called the Kilpatrick Hills, are much lower than the Campsie Fells and the Dundaff Hills, and hardly ever attain more than 700 feet. They occupy a considerable space, sending off offsets to the W. and N. These offsets advance southward to the road leading from Dumbarton to Glasgow, where Chapel Hill and Dumbotter Hill are situated. The rock of Dumbarton is the most W. extremity, and on the other side of the Clyde, opposite it, begin the Renfrew Hills. On the N. the offsets of the Kilpatrick Hills advance to a short distance from Kilmarnock, near the mouth of the Endrick.

The descent of the Campsie Hills to the N. is everywhere gentle, and often terminates in moors; on the S. their declivity towards the plain is steep, and the streams are full of rapids and falls. The valleys within the range are rather narrow, rarely exceeding half a mile in width, except where they approach the open country which encloses the Camp-

CAMPTO

nical characters:—Antennæ not inserted close to the eyes, geniculated in the males; and furnished externally with long hairs. [XYLOPHAGI.]

CAMPTODONTUS (Dejean), a genus of coleopterous insects, of the family *Scaritidae*, closely allied to *Oxytomus*; from which genus however the present is distinguished by the species having the labial palpi shorter than the external maxillary: antennæ with the basal joint scarcely longer than the two following joints taken together. [SCARITIDÆ.]

CAMPUS MARTIUS, the name of a district outside the walls of ancient Rome, between the Quirinal and Pincian Mounts and the Tiber. It is chiefly level ground, and little higher than the river. It was originally called *Campus Tiberinus*, but having come into the possession of Tarquinius Superbus, it was, after the expulsion of that king, consecrated to the god Mars, and became a suburban place of resort for the citizens, for whose diversion gardens, shady walks, a race-course, a naumachia, theatres, &c., were successively constructed. The election of the consuls and other magistrates was held in the *Campus Martius* in the time of Cicero, and much of the canvassing took place there. Under Aurelian, the walls of the city having been extended, the *Campus Martius* became inclosed within their boundary. It was included in the region called *Circus Flaminius*. The name of *Campo Marzo* is now applied to one of the 14 Rioni or districts of modern Rome, which forms the northern part of the old *Campus Martius*, between the Pincian Mount and the Tiber, and includes the fine entrance into the city by the *Porta del Popolo* and that part of the *Corso* nearest to it, the *Piazza di Spagna*, where most foreigners reside, the *Villa Medici*, and the new gardens on the Pincian Mount, the port or quay of *Ripetta*, the palace *Borghese*, and the amphitheatre of *Corca*, which is used for bull-fights and fire-works, and which is built on the ruins of the mausoleum of Augustus. This district is the most bustling and lively, and one of the healthiest in Rome.

The name of *Campo Marzo* is also retained to denote a place in another district of the town, near *Piazza Navona*, where the palace *Braschi* and *Paquin's* bust are, and which formed part of the ancient *Campus Martius*.

CAMPYLOMYZA (Wiedeman), a genus of dipterous insects, of the family *Tipulidæ*. Generic characters:—Proboscis curved; antennæ filiform, fourteen-jointed, two basal joints tolerably thick, the remaining short, cylindrical, and covered with fine hairs; body short; femora elongated; wings hairy, with one marginal cell, and three posterior cells, the first and second divided by an indistinct nervure.

The species of this genus are all extremely minute, and found on the leaves of trees.

C. bicolor is less than one-twelfth of an inch in length, of a blackish colour, with the edges of the abdominal segments pale; legs pale yellow. This species, and three or four others inhabit this country.

CAMPYLOPTERUS. [HUMMING BIRDS.]

CAMPYLUS (Fischer), a genus of coleopterous insects, of the family *Elateridæ*. The species of this genus are distinguished by their having the hinder part of the head free, or not sunk into the thorax as far as the eyes, as is usually the case in this tribe. The eyes are globular and projecting: the antennæ are rather long, obscurely pectinated, and inserted close to the eyes beneath a projecting frontal ridge; thorax narrow; elytra much elongated, and somewhat linear.

C. dispar, a common insect in this country, is found on the leaves of trees, and on nettles and other plants. It is nearly half an inch long, and of an ochreous colour, with the under part of the body more or less black: sometimes the posterior part of the head, the disc of the thorax and elytra, and the femora are black.

About six or seven species of this genus have been discovered, most of which are European. The above-described species is the only one known to inhabit England.

CAMUS. We insert this article principally to make the distinction between several mathematicians of this name.

1. François Joseph des Camus, born 1672, died 1732, author of *Traité des Puissances mouvantes*, 1722, and editor of *Variation's Mécaniques*, 1745. He died in England, whither he had come in search of employment.

2. Charles Etienne Louis Camus, born 1699, died 1748,

was also concerned in the verification of Picard's de 1757.

3. Nicholas le Camus des Mézières, born 1721, died 1789, author of various works on architecture, his profession.

CAMWOOD (German, *Kammholz*; French, *Bois de Cham*; Portuguese, *Pau Gabão*), a red dye-wood, the colouring matter of which is similar to that of Nicaragua or peach-wood. It is used with alum and tartar as a mordant. It does not afford more than a third part of the colouring matter yielded by an equal quantity of Brazil wood. It is used likewise by turners for making knife-handles, and by cabinet-makers for ornamental knobs to furniture. The greatest part of the camwood imported into this country from that colony in 1832 was 835 tons; and in 1833, 917 tons: its value is about 22*l.* per ton. The duty on importation was reduced from 15*s.* to 5*s.* per ton in 1832, previous to which the importations did not average 400 tons in the year.

CANAAN. [PALESTINE.]

CANADA, divided into Lower and Upper Canada, is the most important British settlement on the continent of America. Its southern extremity is Point Pelée, or South Foreland, which extends to the S. of 42° S. lat. (near 82° 70' W. long.) No boundary having yet been fixed between Canada and the British possessions to the S. and W. of Hudson's Bay, it is impossible to assign its extent towards the N. It is however usual to consider all the countries north of the great lakes, which are drained by the rivers that fall into the St. Lawrence, as belonging to Canada; while those drained by the rivers falling into the Atlantic, or Hudson's Bay, are considered as portions of other divisions of the British possessions. Conformably to this notion, the most northern point of Canada lies between 52° and 53° N. lat., at some distance N. of the Lake of Manicouagan, near 65° W. long. The most E. point is Cape Gaspé, S.W. of the island of Anticosti, 64° 15' W. long.; and the most W. extremity may be considered to be Fort William, on Lake Superior, or rather Goose Lake, which is situated at some distance from that establishment to the W.S.W., in 90° 20' W. long.

Canada borders, on the W., N., and for the most part also on the E., on other British territories, and in these directions its boundary line is generally undetermined. On the S., and partly on the E., it is bounded by the United States of North America, the boundary being formed by a line drawn through the lakes Superior, Huron, Erie, and Ontario, and the passages which unite these lakes to one another. From the E. extremity of Lake Ontario, the boundary follows the course of the St. Lawrence, or as it is here called Cataraqui, till it is cut by the parallel of 45°. It then runs E. along this parallel, and across Lake Champlain, to near the sources of the Connecticut River, between 71° and 72° W. long.; and here it follows in a winding line the course of the mountains, which separate the water-courses falling into the St. Lawrence and St. John River from those that by a southerly course run through the state of Maine. The boundary line thus described terminates at Mars Hill, 46° 30' N. lat., and 67° 10' W. long.; but the United States claim a considerable tract to the N. of this boundary line. The meridian of 67° 50' W. long. divides Canada from the British colony of New Brunswick till it meets the River Ristigouche, whose course separates both countries to its mouth in Chaleurs Bay.

The average breadth of Canada from S. to N. is about 300 miles, and the length from Lake Superior to the Island of Anticosti about 1000. This gives an area of about 300,000 square miles, or the whole of France and about one-third more; twice the surface of the British island and one-half more. This calculation is somewhat at variance with the statement that Upper Canada contains about 90,000 square miles; Lower Canada, 205,863; and the St. Lawrence River with its estuary, 52,500: total surface, 348,363.

Nearly the whole of Canada is situated within the basin of the St. Lawrence River. All the tract to the N. of the lakes and of the river belongs to it, and also about one-third of that to the S. of the river. The other two-thirds S. of the river include the countries drained by the upper course

of the St. John River and its tributaries, which form the district claimed by the United States.

The N. boundary of the basin of the St. Lawrence coincides with the N. boundary of Canada, but on the S. it extends to a considerable distance into the United States of America, running from the W. extremity of Lake Superior to the most southern point of Lake Michigan, by a line describing a curve towards the point where both lakes approach nearest one another. From the most S. point of Lake Michigan it runs E.S.E. to the sources of the river Maumee, which empties itself into the most W. corner of Lake Erie: it then turns E.N.E. towards Lake Erie, and runs parallel to it at an average distance of 15 or 25 miles. So far the elevated land forming the margin of the basin of the river seems to be from 1000 to 1200 feet above the level of the sea. At the E. extremity of Lake Erie the range forming the boundary-line turns due E., and runs parallel to Lake Ontario; but here the distance from the lake varies from 60 to 70 miles, and the average elevation of the country is estimated at rather more than 1400 feet above the sea. This range, which up to 75° W. long. continues in that direction, E. of that meridian turns to the S. and joins the Catskill Mountains on the banks of the Hudson (near 42° N. lat.). Between the most N.E. extremity of this ridge of high land and another ridge which begins near 74° W. long. and 43° 20' N. lat. on the S. shores of Lake St. George, the edge of the basin of the St. Lawrence is not formed by a ridge, but by a nearly flat country, which is not more than 500 feet above the level of the sea. Through this break the Great Erie canal in the State of York has been cut. [New York.] From the S. corner of Lake St. George the edge of the St. Lawrence basin runs first N. by E., but having approached to the distance of 70 miles from the banks of the river, it turns N.E., and runs parallel to its course up to 70° 20' W. long., where it follows the mountain-ridge which extends from the origin of St. John's River northward till it approaches within 20 miles of the St. Lawrence. This distance it maintains on an average up to Cape Rozier, at the mouth of the wide estuary of the river. The high land forming the edge of its basin east of Lake George is probably never less than 1500 feet above the level of tide-water.

The whole basin of the St. Lawrence is calculated by Darby to contain 537,000 square miles, of which

The upper basin, or that of Lake Superior, contains	90,000
The middle basin, terminating at the great falls of the Niagara	160,000
The lower basin, to the mouth of the St. Lawrence	287,000
	<hr/> 537,000

Of this area, about 149,000 square miles are covered with water, not including in the calculation the smaller lakes, and taking into the account only the five larger and the St. Lawrence, with its wide estuary.

Lake Superior covers	43,700 sq. m.
Lake Huron	16,500
Lake Michigan	13,500
Lake Erie	10,900
Lake Ontario	12,600
River St. Lawrence, and its wide estuary	52,500

149,000

According to this calculation, there remain 386,000 square miles, of which about 270,000 square miles belong to Canada, and 98,000 square miles are included in the United States of America.

Lake Superior, the true source of the St. Lawrence, is the greatest fresh water lake on the globe, measuring on a curved line drawn through the centre more than 400 miles in length: its extreme breadth is 175 miles, and its circumference, following the sinuosities of the coast, about 1740 miles. Its surface, according to a rough calculation, is above 43,000 square miles, or about 7000 miles less than England. Its surface is 627 feet above the tide water in the Atlantic; but its greatest depth descends below it, being 792 feet. When its surface is agitated by storms it resembles the ocean. It is subject to a considerable rise at the time of the spring-freshes, especially after a rigorous winter. The heights which enclose its basin are at some places 50 or even 70 miles distant, in others they approach near and form the very margin of the lake. The rivers

which fall into it are not long, but the of 50 of some size, and several are broad. In general they are not navigable, or on tance, as they descend in their short cou which are from 500 to 614 feet above the Louis, which enters at the extreme S.W. channel of communication with the Upper Mississippi; it rises 551 feet above the lake. Along its N. es the rocks are from 300 to 1500 feet high, and would nder the navigation dangerous during a gale but for the numerous small islands near the entrance of inlets and bays, in which vessels find shelter. The country is dreary, and almost without trees or vegetation; the climate is cold, and game and esculent plants exceedingly scarce. Along the S. shore of the lake extends a low sandy beach, intersected with rocks of limestone, rising 100 feet above the surface of the water. The navigation is dangerous in this part, owing to there being no bay on the whole extent of the coast. Islands only occur along the N. shore and towards each extremity of the lake. The largest, called Isle Royal, is said to be 100 miles in length by 40 in breadth, but on our maps it has not half these dimensions. The waters accumulated in Lake Superior are carried off by a river issuing at its most eastern angle, called St. Mary's River or Strait. About 12 or 15 miles from the lake it forms the rapids of St. Mary, which are produced by a great mass of water forcing its way through a confined channel. The rapids are nearly two miles long, and have altogether a fall of 22½ feet perpendicular height. Canoes sometimes venture to descend the rapids, but they are generally avoided by a portage about two miles long, which connects the navigable parts of the river. As far as the falls the river runs E., but below them it turns to the S.E., and dividing into several channels encloses numerous islands, of which the most considerable are Sugar Island, St. Joseph, and Drummond; the two former belong to Canada, and the latter to the United States. This part of the river is navigable for boats and sailing-vessels of six feet draught. Above the Island of Drummond the river widens, and soon enters Lake Huron, after a course of above 40 miles, in which it falls 32 feet, the rapids included.

Lake Huron is only second to Lake Superior in extent, its greatest length in a curved line between St. Mary's Strait and its outlet being above 240 miles. From S. to N. it is 186 miles. Its extreme breadth, which lies nearly W.N.W. and E.S.E. is about 220 miles; its circuit exceeds 1000 miles. The surface is 595 feet above high water the Atlantic; and its greatest depth exceeds 450 feet. is divided into two unequal portions by a series of islands, called Manitoulin Islands, and by a peninsula, called Cabot's Head. The Manitoulin Islands begin on the E. of Drummond's Island in the very mouth of St. Mary's River, and extend E. with an inclination to the S. for 120 miles. One of them, Great Manitoulin, is upwards of seventy-two miles long, and varies in breadth from three to twenty-three miles, being singularly indented by inlets and groves, which give it a very irregular and broken outline. Its name is derived from the language of the Indians, who consider it as the dwelling of the Great Spirit, or 'Manitou'. These islands are divided from Cape Hurd, the northern extremity of the peninsula of Cabot's Head, by a strait about ten miles wide, which contains a few small rocky islands. Cabot's Head projects from the S. shores of the lake, about fifty miles into the lake, with an average width of twelve miles. That portion of the lake, which is thus separated from its main body, is called Georgian Bay, and measures in length from the most S. point of Natasawaga Bay to St. Mary's Strait about 225 miles. Its S. portion E. of Cabot's Head has an average width of fifty miles, and lies S.S.E. and N.N.W.; but between the Manitoulin Islands and the N. shores of the lake it does not exceed seven or eight miles, and sometimes contracts to three. At Natasawaga Bay the shores are high, but the lake is free from rocks. Farther N. the shores are much indented, and fringed by a multitude of small islands and rocks. The main body of Lake Huron contains very few islands, and is generally of great depth. The shores of Lake Huron, opposite the Manitoulin Islands, are elevated and broken, especially between 81° and 82° W. long., where there is a bold ridge of hills, called Cloche Mountains, extending about forty miles along the coast, and exhibiting distinctly three or four elevated summits. Farther to the S.E., clay cliffs, rolled stones, abrupt rocks, and woody slopes of various elevations, from

30 to 100 feet constitute the shores as far as Cabot's Head. The peninsula exhibits nearly the same character; but the country above those heights is supposed to be of extensive fertility. From Cabot's Head to the outlet of the lake, the shores are in general low, or of very moderate height. The W. shores of the lake do not rise to a great height, forming nearly in the middle a deep and wide inlet, Green Bay, which is sixty miles long by twenty wide. Along the rivers falling into Lake Huron three are remarkable—the Francis, the outlet of Lake Nipissing, the Muskoka, the outlet of the lake of that name, and the Severn, which issues from Lake Simcoe.

At its N.W. extremity this lake is united to Lake Michigan by the strait of Machillimakinac, which is only six miles long and eight wide. Lake Michigan is nearly 300 miles long, with an average width of seventy-five, and very deep. Its form is elliptical and regular, except a break in its W. coast, which forms the Green Bay, and is said to extend 100 miles parallel to the lake, and another inferior bay on the opposite side, called Grand Traverse Bay. Its shores are everywhere of a moderate height. This lake is entirely surrounded by the territories of the United States.

The river St. Clair issues from the S. point of Lake Huron, and runs thirty miles between moderately high banks, till it expands into Lake St. Clair, which is about thirty miles in diameter, and shallow, but has sufficient depth in its channel to admit steam-boats and schooners; and the same is the case with the river St. Clair. The shores of the lake are low and level; and it receives from the E. two considerable rivers, the Great Bear River or Creek, and the Thames. Issuing from the S.W. angle of Lake St. Clair, the river is called Detroit. It first runs W., and then bends in a regular curve about due S. to its influx into Lake Erie. Its length is twenty-nine miles, and it is navigable for such vessels as are employed upon the lakes, being from seven to eight feet deep. At Amherstburgh, near its mouth, is an excellent harbour. The banks of the river are moderately elevated; the fall between Lake Huron and Lake Erie is thirty feet.

Lake Erie is 265 miles long, and 63½ broad at its centre: its circumference is computed at 658 miles; and its surface is 565 feet above sea. Its greatest depth is about 100 feet, with a rocky bottom. The navigation on this lake has rapidly increased since the Great Erie Canal in the State of New York and the Welland Canal in Canada have been formed; but several circumstances combine to render it tedious and dangerous. A constant, and when calm, a very perceptible current runs down the lake, which, added to the prevalence of S.W. winds, retards the progress of vessels whither proceeding W.; and their course is rendered still more intricate by several elongated points which stretch from the N. shore into the lake. The most conspicuous are Point Pelée or South Foreland, Point aux Pins or Landguard, Long Point or North Foreland, and Point Abino. There is also a want of deep harbours, especially on the low and level northern shores. The S. shores belonging to the United States are also in general low, except between Cleveland and the mouth of the river Huron, where the cliffs rise almost perpendicularly nearly sixty feet above the water-level. This shore has some harbours for small vessels, such as the mouth of the Cattaraugus, Presqu'île, and the bays of Sandusky and Miamce. The small islands at the W. end of the lake have also in some places good anchorage and shelter for small vessels; and on Cunningham's Island, which belongs to the United States, there is a fine harbour called Put-in-Bay, which has twelve feet of water, and is well sheltered. The basin of this lake does not receive any great river, except at its W. and E. extremities. At its W. end it receives the Detroit and the Miamce, which flow in the territories of the United States; and at its E. end the Ouse or Grand River, whose mouth makes the best harbour on the N. shore.

The waters of Lake Erie descend to Ontario by the Niagara River, which commences at the extreme N.E. point of Lake Erie, and runs thirty-three miles and a half, measured along its course, in a general direction from S. to N. Its breadth varies from half a mile to one mile and more. It divides several times into two branches, including some islands; of which the largest, Grand Isle, belonging to New York, contains 11,200 acres. Below this island the river is about one mile wide, and turns to the W., in which direction it flows to the Great Falls, three miles and a half distant. These cataracts are twenty miles from the beginning

of the river. In this distance its waters fall sixty-six feet, of which they descend fifty-one feet in the space of the half mile immediately above the falls, so that the river is navigable to the village of Chippawa. The Great Falls are formed where the river suddenly turns to the N.N.E. Above the falls the banks of the river are very little elevated above the water's edge; but below the falls the current flows rapidly in a bed several hundred feet deep, and walled in on both sides by perpendicular rocks. The cataract consists of two falls, divided from one another by a small island, called Goat Island. The fall on the American side is 162 feet high, and 375 yards wide. The fall on the Canadian side is 700 yards wide, and 149 feet high. The face of Goat Island measures 330 yards. The whole breadth of the river at this point is 1405 yards. Five miles lower down is a very strong eddy, called the Whirlpool; and five miles below it, the river emerges from the rock-bound chasm, and flows in a deep and gentle current between banks of moderate elevation. At some very remote period, the falls were probably much farther to the N., between the villages of Queenstown and Lewistown, but the rocks have gradually given way to the continual friction of the rapid current, and receded to their present situation. As more than one-third of the Niagara is not navigable, the navigation of Erie and Ontario has been united by the Welland Canal.

Lake Ontario extends nearly W. and E. in an elliptical shape, measuring in length 172 miles, and in extreme width nearly sixty: its circuit is stated to be 467 miles; the depth varies from three to fifty fathoms, except in the centre, where it sinks to 100 fathoms. Its surface is 234 feet above the tide-water in the Atlantic. Its shores round the W. end are of moderate height, but they rise higher E. of the town of York, where they assume a lofty character, but subside gradually as they approach the peninsula of Prince Edward. The remainder of the Canada side up to the beginning of the river Cataragui is low, and in many places marshy. The southern shores are, in general, low or very little elevated, and are destitute of harbours, except at the E. end of the lake, where there is a good harbour at Sackett. The Canadian shores have in this respect the advantage, possessing two excellent harbours for vessels of a middling size at York and Kingston: the Bay of Quinté also affords at several places excellent anchorage. Two large rivers fall into the lake from the S., the Genessee and the O-ways or Onondaga; on the northern side the Trent falls into the Bay of Quinté. There are some small islands at the E. extremity: the largest is Wolfe Island, opposite Kingston, at the efflux of the Cataragui or St. Lawrence, by which two channels are formed leading to the river; the northern channel is called the Kingston Channel, and the S. the Carleton Channel.

The St. Lawrence issues from Lake Ontario by the two channels which surround Wolfe Island, but in this part it has not the name of St. Lawrence, which is properly only applied to its course below Montreal, that above Montreal being called Cataragui. The part of the river immediately below Wolfe Island has the appearance of a lake, from two to ten miles wide, with a very gentle current. It is studded with a multitude of small islands varying greatly in extent, shape, and appearance, whence it is called the Lake of the Thousand Islands. The number of these islands is 1692. The lake extends to about 40 miles from Lake Ontario, when the channel gradually becomes narrower and the current imperceptibly increases, but continues gentle down to Fort Wellington. Some miles below this place a series of rapids commences, which is almost uninterrupted to the head of Lake St. Francis, immediately below 45° N. lat. The greatest impediments to navigation occur between Johnston and Cornwall, where the river in 39 miles falls 75 feet, and very violent rapids are formed by the heavy volume of the waters. It is however navigated by boats of from six to fifteen tons, and six years ago it was stated that 10,000 tons were employed in this navigation.

The lakes of St. Francis and St. Louis, which follow, are only expansions of the river. The former is 25 miles long by 5½ where widest. Lake St. Louis, which is formed by the junction of the Utawas or Ottawa river with the Cataragui, is 12 miles long and six broad at its greatest width. Between them lie the Cascades, where the great volume of water is impetuously pushed towards some rocks, and repelled by them, so that large round waves are formed, which produce

an agitation in the waters resembling that of the most furious tempest. To avoid this dangerous place a small canal has been made across a point of land near Le Buisson, 500 yards long, and furnished with the necessary locks: it is called the Military Canal. At the junction of the Ottawa and Lake St. Louis there are four considerable islands formed by the different channels of the river, Montreal, Isle Jesus, Bizarro, and Perrot, of which Montreal, the largest, contains the town of Montreal. The principal channel runs between the island of Montreal and the S. bank, first due E. and afterwards nearly due N. Where it turns to the N. there is a beautiful rapid, called Sault St. Louis, which is very dangerous and almost impassable for boats and vessels, on account of the great rapidity of the current. A canal has been cut through the S. E. part of the island of Montreal, which is rather more than eight miles long, extending from the village of Upper Chine to Montreal. This canal, called La Chine, is 48 feet wide at the surface, 28 at the bottom, and 5 feet deep. The Sault St. Louis is the last considerable impediment in the navigation of the St. Lawrence.

Though Montreal is 380 miles from the Gulf of St. Lawrence, vessels of 600 tons get up to it with very little difficulty. Below Montreal the width of the river varies from three to four miles till it expands into Lake St. Peter, which is 25 miles long, and above nine miles wide. Groups of islands cover about nine miles of its surface at its upper end, and farther down shoals stretch from both banks, which are low, far into the lake, so that only a narrow passage from 12 to 18 feet deep is left in the middle. About 10 miles from the lower end of this lake, the St. Lawrence is joined by the river St. Maurice, near the town of Three Rivers, where the tides are sometimes perceptible, though they are generally not much felt for several miles farther down. Three Rivers is 432 miles from the head of the island of Anticosti.

Richelieu Rapid, the last in the St. Lawrence, occurs 52 miles below the Three Rivers. The bed of the river is here so much contracted and obstructed by rocks that it leaves only a very narrow channel, in which at ebb tide a rapid is formed that cannot be passed without great care. But when the ocean swell is at its height the rapid disappears, as the tides rise here from 15 to 20 feet. At Quebec the river is only 134 yards wide, but it soon expands considerably, and continues increasing in breadth till it enters the Gulf. At the mouth of the river Saguenay it is 18 miles across, and at Cape des Monts or Mont Pelée 25 miles; but here the N. bank trends suddenly almost N., so that at the seven islands both banks are 73 miles apart. The distance between Cape Roziere and Mingan settlement on the Labrador shore is very near 105 miles. This may be considered as the embouchure of the St. Lawrence. Its waters begin to be brackish 21 miles below Quebec, and they are perfectly salt at Kamouraska, 75 miles lower down. Several islands occur in the lower and wider course of the river, of which the largest is the island of Orleans, about 10 miles below Quebec, which is about 18 miles long, 5 wide, and well cultivated. At the mouth of the river is the large island of Anticosti.

If we consider Lake Superior as the true source of the St. Lawrence, the course of the river is between 600 and 700 miles shorter than that of the Mississippi, as the following table shows:—

Lake Superior, along a curved line drawn through its centre	400
Straits of St. Mary	40
Lake Huron, also along a curved line through its centre	240
River St. Clair	30
Lake St. Clair	30
Detroit River	29
Lake Erie	230
River Niagara	33
Lake Ontario	155
St. Lawrence, up to Cape Roziere	692

1859

The upper branches of the rivers falling into the great lakes or the St. Lawrence are said to be divided from those falling into Hudson's Bay by the chain called the Land's Heights; but we are little acquainted with that part of the country, and it is not improbable that it may turn out that no such chain exists, and that here, as in other parts of

North America, the rivers have their origin in lakes which lie in a plain of a nearly level surface, and are situated at the same elevation above the level of the sea.

That part of Canada to the N. of the great lakes and the river St. Lawrence may be divided into three sections. The most western comprehends the country of Lake Superior and the N. shores of Lake Huron, and is divided from that farther E. by the range of mountains called La Cloche, which commence opposite the E. extremity of Grand Manitoulin Island, and extend farther N. than they have been explored. This part of Canada is very little known, and contains no European settlement, except a few establishments for the fur-trade. It seems to be a table-land of considerable elevation, the surface of which is often slightly broken and covered with small hills, but in other parts spreads out in extensive levels. It is full of small lakes, and is traversed by a great number of small rivers; in some places it is covered with extensive swamps. Being generally well wooded it is probably fertile.

The middle section extends from the La Cloche mountains E. to the Ottawa, and comprehends all the countries W. of that river, and also the peninsula which lies between the lakes Huron, Ontario, and Erie, and terminates at the rivers St. Clair and Detroit. It embraces, consequently, the whole of what is now called Upper Canada, and a small portion of Lower Canada. The surface of this section comprises a table-land of a somewhat uneven surface, two extensive terraces, and a level plain.

The table-land comprehends the northern part of the country, and about half of the whole; its southern edge is marked on the W. by the rise in the country between Lakes Simcoe and Muskoka. This activity continues eastward, at a distance of about 20 miles S. of 45° N. lat., and may be considered as terminating a little E. of the meridian of 77°. A line running due N. near this meridian separates it from the country farther E. From the shores of the Georgian Bay the country rises rapidly to a considerable height; that portion of the table-land E. of Lake Huron is 750 feet above the lake, and 1344 feet above the sea. This height, or one somewhat lower, may be considered as the average elevation of the table-land. Its surface is probably not very irregular, except towards the banks of the Ottawa, where it is broken by extensive valleys, running parallel to the river, and considerably depressed below the surface of the table-land. About the middle of this elevated country is a depression which contains numerous lakes, united by two rivers, of which one called Nesswabic runs N. and afterwards E. and joins the Ottawa, and the other, called Muskoka, runs first S. and then W.; and after having traversed the Trading Lake and Lake Muskoka, and formed several rapids, empties itself into the Georgian Bay. Towards the N.W. boundary is Lake Nipissing, which is above 50 miles in diameter, and is 750 feet above the sea. From its S. extremity issues a river called Francis, which forms several rapids before it enters Lake Huron. As far as this table-land has been explored it appears to be generally covered with forests of hard wood, and to have a fertile soil. It is still entirely in possession of the native tribes, among which the Mississauga are the most numerous.

The Ottawa, which bounds this country on the E., issues from Lake Temiscaming, but its remotest branches rise nearly 100 miles beyond that lake. Its upper course is only visited by traders in fur and timber. The first European settlement is at Lake Allumettes, not far from the place where the Nesswabic enters the lake. In this part the Ottawa, divided into two channels, surrounds an island, called Black River Island, which is about 15 miles long, by an average breadth of four. The upper course of this river consists only of a series of lakes, connected by short channels, which always exhibit rapids or falls. Farther down is the Grand Calumet Island, which is about 20 miles long, and 7 miles in its greatest width. Both the channels which enclose it are full of rapids. At the lake Des Chats the Ottawa is joined by the Madawaska, which descends from the table-land by a course of about 100 miles. Lake Chaudière is 18 miles long, with an extreme breadth of 5 miles; at the lower end of this lake commences the falls called Chaudières, or kettles, from their form, the principal of which is 60 feet high. Below these falls the Ottawa is navigable for steam-boats to Granville, a distance of sixty miles; and in this part of its course the banks of the river, which so far are high and steep, subside so much that the adjacent country in spring and autumn for

more than a rail. At Point Pelee the Ottawa gradually begins to expand into a lake, called Lake Two Mountains, which joins the St. Lawrence where it forms the lake St. Louis, above Montreal. To avoid the rapids between Grenville and the Lake Two Mountains some cuts have been made along the river on its N. bank, which are called Grenville Canal. They have the same dimensions as the canal La Chine. Thus the Ottawa is navigated up to Bytown and the Chaudière Falls, a distance of above 100 miles. The course of the Ottawa from Lake Temiscaming to Lake Two Mountains is about 350 miles.

The country bounded by the lower course of the Ottawa and the Cataract rises with gentle acclivities in the form of terraces from the banks of both rivers. In the E. districts the highest land extends at no great distance from the Cataract; but N. of the Lake of the Thousand Islands it turns to the W., and continues in that direction till it joins the table-land, near 77° W. long. This ridge is probably not more than 700 feet above the sea: it is lowest at its western extremity, where it occupies a greater space, and encloses a number of lakes, the greatest of which are the Rideau and Mississippi lakes. Some portions of this country are marshy, but in general the soil is fertile, and agriculture is rapidly advancing.

The comparatively small elevation of the western districts has suggested the formation of a canal between Lake Ontario and the Ottawa. This canal is called the Rideau Canal, from its passing through the lake of that name: it is 135 miles long, beginning at Kingston on the shores of Lake Ontario, and terminating at the foot of the Chaudière Falls. Lake Rideau, which is about 24 miles long, and 6 miles wide on an average, is the summit-level of the canal, from which it descends 283 feet to the Ottawa river, and 154 feet to Lake Ontario. On the N. side of Rideau Lake are 36 locks, and on the S. side 17. The locks are 142 feet in length, by 33 in width, the depth being 5 feet, so that sloops and steam-boats from 100 to 125 tons can navigate the canal.

The country between the table-land and Lake Ontario forms two distinct terraces, which extend from E. to W.: they are divided from one another by a ridge of hills, which begins near 77° and 78° W. long., near the W. end of the Bay of Quinté, about 8 or 9 miles from the shores of Lake Ontario, and runs W. nearly in a straight line, under the parallel of 44°. As they proceed farther W. they are farther from the lake, so that opposite the town of York the plain along the shores of the lake is 24 miles wide, and where the ridge terminates, near 80° W. lat., it is still wider. Between this ridge and the S. edge of the table-land is the upper terrace, which is much larger. At the E. extremity it extends to the shores of the Bay of Quinté, and farther W. the southern range remains always about 50 miles distant from the S. edge of the table-land; its length is about 150 miles. Both terraces are divided from the low plain, which extends farther W. between the lakes of Huron and Erie, by a ridge of hills which begins on the N. on the shores of Natasaugua Bay, and runs S. to the W. end of Lake Ontario, where it forms the Burlington Heights, and continues along the shores of Burlington Bay, and the S. side of Lake Ontario, at a distance not exceeding from 4 to 8 miles. Near Queen's-town it reaches the Niagara river, where it forms the great falls. It continues in an E. direction through the State of New York to Lockport, where it is about 12 miles from Lake Erie. It afterwards crosses the Great Erie Canal, runs parallel to it, and subsides at Rochester, on the Genessee river.

The northern and larger of the terraces seems to rise gradually from E. to W. If its western district is Lake Simcoe, whose surface covers 800 square miles, and is at least 100 feet above Lake Huron, and 468 above Lake Ontario. From its N. shore issues a considerable river, called the Severn, which empties itself into an inlet of Lake Huron, called Gloucester Bay. The country between Lake Simcoe and Balsam Lake, which lies farther E., probably rises nearly 800 feet above the level of the sea. Balsam Lake receives a river which descends in a S.W. direction from the table-land, but is very little known. The lake may be considered as the source of the river Trent, which running E. unites the lakes Sturgeon, Pigeon, Shesong, Shababoon, and Trout, all of which lie on the northern border of the terrace, and extend several miles from S. to N. Issuing from Trout Lake, the river runs with many windings S., and reaches Rice Lake by a bold bend to

E. This lake, which is 25 miles long, and from 4 to 5 miles wide, lies S.W. and N.E., and only 15 miles from Lake Ontario. The Trout leaves the lake at its N.E. extremity, and continues in that direction for about 30 miles, when it turns E., and soon afterwards S.W. It changes again its course to the E., and afterwards to the S., till it falls into the Bay of Quinté. It is stated that this river is navigable for boats in all its extent, which is somewhat surprising, as its source is more than 450 feet above its mouth, and its course in a straight line falls short of 100 miles, and measured along its windings cannot exceed 300 miles. The execution of the projected water-communication between the lakes Ontario and Huron, by means of this river and Lake Simcoe, is rendered difficult by the numerous rapids of the Severn.

The Bay of Quinté, into which the Trent falls, is only long, irregular, and winding lake, divided from Ontario by the peninsula of Prince Edward. Its length, measured along its windings, is near 50 miles, and its breadth varies from 6 to 12. The isthmus by which it is divided from the lake, is, at its W. extremity, only 3 furlongs wide. The peninsula of Prince Edward is indented on every side by numerous small bays and coves, offering anchorage and shelter for such vessels as navigate the lakes.

The soil of the upper terrace, so far as it is known, is fertile, and contains very few sterile tracts, except several swamps of moderate extent. The whole is still covered with wood and high forest trees, the European settlements being few, and at great distances from one another. Iron ore is abundant, and begins to be worked.

The southern and more narrow terrace, which terminates in rather a high shore on Lake Ontario, and extends between the peninsula of Prince Edward and Darlington, is rather level, and in general extremely fertile, with the exception of a sandy plain between Ontario and Rice Lake: to the W. of Darlington the soil along the lake is of an inferior quality. Though the number of European settlements is rather considerable in this district, at least in comparison with those farther N. and W., by far the larger portion of its surface is still covered with wood.

The plain of Upper Canada comprehends the peninsula which extends between the Lakes Erie and Huron, nearly in the form of an equilateral triangle, whose base is formed by a line drawn from Fort Erie, on the inlet of the river Niagara, to Cape Hurd, the N. extremity of Cabot's Head, a distance of 216 miles. Another line, cutting it at a right angle and striking Detroit river at Amherstburg, is about 193 miles long. All this tract, which contains about 20,000 square miles, is level, or slightly undulating, except on its E. side, where it borders on the hills which separate it from the terraces. About the sources of the Thames indeed it appears to contain some rising ground, the upper plain of which is a kind of swamp or moor. The whole tract is an alluvial soil of great fertility, containing neither stones nor gravel. Most of it is covered with large forests of maple, beech, oak, basswood, ash, elm, hickory, walnut, butternut, chestnut, cherry, birch, cedar, and pine. In the midst of these woods, and sometimes on the banks of the rivers, there are prairies, or natural meadows, of no great extent, generally covering only a few thousand acres, and containing on them small clumps of lofty pines, white oak, and poplar, scattered here and there. The largest of these prairies are in the neighbourhood of Long Point and the rivers Thames and Ouse.

The largest river of this plain is the Thames, whose sources are in the great swamp which occupies the centre of the country. Its upper course is N. and S., as far as London, whence its general direction is S.W. It discharges itself into Lake St. Clair, after a winding course of nearly 150 miles. It is navigable for vessels as far as Chatham, 15 miles from its mouth, and for boats nearly to its source; but it has a bar at its entrance.

The Ouse, or Grand River, rises in the hills S. of Natasaugua Bay, about 30 miles from it, and runs with a very winding course, first about 75 or 80 miles S. and then nearly the same distance S.E. till it falls into Lake Erie at Sherbrooke. It has more water than the Thames, and is 900 yards wide at its mouth, but the bar across its entrance has only eight feet of water on it. Nevertheless it forms one of the best harbours on the N. shore of Lake Erie. The river is navigable about 25 miles from its mouth for schooners, and considerably farther up for large boats.

The Welland, or Chippeway, which rises between the W. end of Lake Ontario and the banks of the Ouse, runs E. and

falls into the river Niagara, nearly three miles above the great falls. For more than 25 miles from its mouth its depth varies between 9 and 15 feet. It has given its name to the canal which unites the Lakes Erie and Ontario.

The Welland canal begins in the Ouse, about two miles above its mouth, and crosses an extensive marsh, called Wellfleet marsh; it is then raised by seven locks to the level of Welland river, in whose bed it continues for 10 miles. It then descends by 32 locks in succession, from the summit of the Queenstown heights to their base. The canal is 42 miles long, 16 between the Ouse and Welland, 10 along the Welland, and 16 from this river to Lake Ontario. It is 56 feet wide at the surface, 26 at the bottom, and 8½ feet deep. The chambers of the locks are 100 feet in length by 22 in breadth, so that vessels of 125 tons can pass through, which is above the average tonnage of the trading vessels on the lakes. The canal may also be entered by the rivers Niagara and Chippeway, the Niagara being navigable to the mouth of the Chippeway.

LOWER CANADA comprehends, on the N. of the St. Lawrence river, the countries E. and N. of the Ottawa, with a small district lying E. of its mouth, and on the S. those extending from the parallel of 45° to Cape Gaspe. We shall first describe the country N. of the St. Lawrence.

About 30 miles below Quebec is Cape Torment, in the neighbourhood of which a mountain rises to the height of 1890 feet above the sea. A line drawn from this point at right angles to the river divides the northern countries into two portions, which are different in features and character.

Between the mouth of the Ottawa and Cape Torment the banks of the St. Lawrence are low, or of very moderate elevation, as far as Richelieu Rapid, 52 miles below Three Rivers; but from this point they begin to rise and assume a bold character, which continues increasing to Cape Diamond, on which Quebec stands, and still more towards Cape Torment. Where the banks are low, the adjacent country from 5 to 15 miles inland is level, or rises gradually to slightly elevated terraces. Beyond this level the country rises in moderate hills with gentle slopes: the width of this tract varies as the range of hills behind it approaches nearer or recedes farther. This range begins on the banks of the Ottawa near Grenville and runs nearly parallel to the St. Lawrence in a N.E. direction, leaving between it and the banks of the St. Lawrence a tract from 20 to 40 miles wide. In the parallel of Quebec it turns E. and covers the country about that town with numerous hills, which are divided from one another by fine valleys. Thus the country assumes a different aspect in those districts where the banks of the river begin to be high and bold. The soil of this tract along the river is generally good, but there are some districts where it is of inferior quality, especially in the neighbourhood of Three Rivers. It is said however that it improves farther inland, and of late years settlements have been formed at greater distances from the banks of the St. Lawrence. This country, though comparatively thinly inhabited, is more populous than Upper Canada.

The country behind the range of mountains has only been explored along the course of a few rivers. It appears to contain very few tracts fit for agriculture in the narrow river valleys. The intervening spaces are occupied by ranges of high and bare rocks which contain numerous small lakes and swamps. The trees which cover a part of its surface do not exhibit a vigorous vegetation.

The larger rivers have their origin to the W. of the mountain-range, break through it, and fall into the St. Lawrence. Those which join it to the S. of the Richelieu Rapid are navigable for 20 miles and upwards from their mouth, but are obstructed by rapids and cataracts higher up. The rivers which discharge themselves into the St. Lawrence N. of Richelieu Rapid are too rapid to be navigated; they are used in the spring to float down the timber to the mills situated near their mouth. This is particularly the case in the country about Quebec, which is considerably elevated above the level of the St. Lawrence.

The largest of these rivers is the St. Maurice, whose upper branches rise far in the interior behind the mountain-range. They are three in number and each of them passes through a considerable number of large lakes. They unite near 48° N. lat., from which point the river runs in a S.E. direction with numerous bends to its mouth near Three Rivers, a course of above 150 miles. It is navigable to La Tuque, about 100 miles from its mouth, but there are some rapids which must be avoided by short portages. The depth of this river is inconsiderable.

The country extending N.E. from Cape Torment is almost entirely unknown, except the valley of the river Saguenay. The coast has a forbidding appearance. From Cape Torment the ridge continues unbroken, except by the beds of rivers and rivulets, until it lowers 15 or 18 miles below the mouth of the Saguenay. It rises from the water-edge with a steep ascent to an average height of 300 or 400 and in some places 2000 feet. Farther down it subsides in approaching the Bergeronnes, and sinks to a moderate elevation at Portneuf, about 40 miles below the mouth of the Saguenay. But towards Pointe des Monts the banks rise again, and continue at a great elevation to the boundary of Labrador. The interior is only known by the information obtained from the natives, who describe it as consisting of rocky cliffs and rugged hills of inconsiderable elevation, dispersed over barren plains, and with thick forests studded with crooked and stunted pines, birch, firs, and cedar. Small lakes and swamps abound over the whole tract.

The Saguenay issues from Lake St. John, which covers about 510 square miles and receives several large rivers, of which the Wapishuan and the Assuapmoussou are the most considerable, but their course is very imperfectly known. Around Lake St. John are some tracts of cultivable land. Two rivers issue from the E. part of the lake, called the Grande and Petite Discharge, and unite after a course of about 40 or 50 miles, forming an island 38 miles long with an average breadth of 17. After their junction the river is called Saguenay, and runs nearly 100 miles to its mouth near Tadoussac. This river is bounded by banks of great elevation, formed of rocks rising from 200 to 1000 feet in height. Its current is very quick, though its depth is great: it is navigable for vessels of any size for about 70 miles to Ha-ha Bay, which is a good harbour. The tide ascends to the union of the two Discharges, and rises about 15 feet. The mass of water which is brought down by this river excites the surprise of every one who sees it.

In the south section of Lower Canada there is a mountain-range at the sources of the Connecticut river, on the boundary line between Canada and the United States, which runs in an E.N.E. direction to the origin of the St. John river. Here it divides into two chains: one runs nearly due E. and divides the waters falling into St. John from those flowing to the Kennebec and Penobscot in Maine, and terminates at a short distance from the banks of the St. John river with Mars' Hill. The other ridge runs nearly due N. till it approaches the St. Lawrence river within about 20 miles. It then turns N.E. and continues in that direction parallel to the river, its rocky heights often advancing to the very edge of the water. Its width up to 65° W. long, may be about 20 miles, but to the E. of Lake Temiscouata it grows wider till it occupies nearly the whole of the peninsula of Gaspé, towards its termination in the capes Roziers and Gaspé. By these mountain-ranges the country is divided into three regions, one lying to the W. of the mountain-range which runs N., and the second forming the narrow tract along the St. Lawrence, and the third comprehending the basin of the St. John river.

The western districts of the first region form an almost level plain, on which, at considerable distances, a few isolated mountains rise abruptly above the surface. The summit of Rouville Hill is 1100 feet above the level of the St. Lawrence. This flat country extends almost to the river St. Francis. But toward the S. the surface begins to swell gradually into ridges, becomes progressively more hilly, till it assumes a mountainous character towards the lakes of Memphramagog and St. Francis. The districts E. of St. Francis river have a hilly and broken surface of moderate elevation. The banks of the St. Lawrence are low, and partly marshy, especially so on the shores of Lake St. Peter; but lower down they gradually begin to rise, and at the mouth of the Chaudière they are high and bold, and continue so to Point Levy, opposite Quebec. The western level districts have the best soil in Lower Canada, from which wheat is exported to Great Britain. This is probably the most populous and best cultivated part of Canada. Between the St. Francis and the Chaudière, the soil varies very much in fertility, and large portions of it are still covered with forests. The course of the rivers which drain this country is less broken and rapid than on the north side of the St. Lawrence, and most of them may be navigated by boats and canoes, though in several of them the navigation is interrupted by rapids. The most important are the Chambly, St. Francis, and Chaudière.

The Chambly, also called Richelieu, St. John, St. Louis,

and Sorel, the largest of the rivers of Lower Canada, fall into the St. Lawrence from the S., rises in Lake Champlain, New York, which lake is united by a short passage to Lake Champlain. Issuing from Lake Champlain, the Chambly is a wide river, but it grows gradually narrower as it proceeds N., so that at its mouth it is only 250 yards broad, while near Lake Champlain its width exceeds 1000 yards. The upper course is rather violent, and at some places broken by rapids; lower down, its current is regular and gentle. It is navigable for decked vessels 12 or 14 miles from its mouth, and to Lake Champlain for boats and canoes. From St. John there is a ship navigation to the m Lake Champlain. By this river the produce of the state of New York contiguous to Lake Champlain is brought to Montreal. At the mouth is the town of n Henry, or Sorel. The course of the Chambly in Canada is above 80 miles.

The St. Francis rises in the lake of St. Francis, which is about 18 or 20 miles long, and very irregular in breadth. The river issues from its W. side, and runs about 70 miles S.W., where it turns to the N.W., and soon afterwards unites with the river Magog, flowing from Lake Memphramagog. It continues its course N.W. to its junction with the St. Lawrence, a distance of nearly 80 miles. The number of rapids and falls render the navigation of this river difficult and laborious; yet the trade upon it is considerable.

The Chaudière rises in the lake of Mégantic, N.E. of the sources of the Connecticut, and flows about half of its course N., and the other half N.N.W. It is not navigable, owing to the rapids and falls following one another in quick succession. About four miles from its mouth are the celebrated Chaudière Falls, which are 130 feet high, the breadth of the river not being more than as many feet. Few falls can be compared with these for picturesque beauty. The course of the river amounts to more than 100 miles.

The country along the St. Lawrence, below the mouth of the Chaudière, rises from the banks of the river in irregular ridges, with generally a steep ascent, and attains a considerable elevation at the distance of 10, 15, and 20 miles from the river. It then forms a sort of table-land, which descends gently towards the river St. John. Though entirely covered with high hills and mountains, it is neither so bold nor so mountainous as the country on the opposite bank of the St. Lawrence. The high banks of the St. Lawrence continue E. of Point Levy, but they soon begin to lower, and for some extent are of moderate elevation. At St. Anne they begin to rise in isolated cliffs of considerable height, and continue so to Kamouraska and St. Andrew's. Further down there is, close to the river, a steep ascent, varying between 150 and 200 feet; and this elevation is still considerably increased opposite Bic Island. From this part to Cape Roziere it maintains nearly the same height and character, except at a few places, where the rivers descend from the adjacent mountains. It is not improbable that the Spaniards, who are known to have visited the St. Lawrence before the English and French, on observing the high banks between which the St. Lawrence rolls its waters to the ocean, in their astonishment may have compared it with a chasm or ravine, and hence called it *Canada*.

A very small part of this country is fit for cultivation, though in some of the valleys formed by the small rivers which descend to the St. Lawrence there is a good soil. In some tracts there are large forests, but the number of timber-trees is comparatively small, except in a few of the larger valleys. The population of this country is inconsiderable.

The peninsula of Gaspé, extending between the mouth of St. Lawrence and the Bay of Chaleurs, was formerly thought to be traversed in the middle by a range of mountains terminating at Cape Roziere; but it has been found to contain an elevated valley, skirted by two ranges of high hills, which extend at a short distance from the St. Lawrence and the Ristigouche river and the Bay of Chaleurs. In the valley there is a series of lakes, which send out rivers, that cut the ranges and fall into the St. Lawrence or the Bay of Chaleurs. The settlements in this country are few and situated along the Bay of Chaleurs, the banks of the St. Lawrence being nearly uninhabited. The inhabitants gain their livelihood by fishing and cultivating a few spots.

That portion of Lower Canada which does not lie within the basin of the St. Lawrence river, but is drained by the St. John and its tributaries, is in its lowest parts probably several hundred feet above the level of the sea. Its surface is very uneven, consisting of a continual succession of ridges,

mountains, and steep ascents, valleys, and low tracts, the rivers. The most elevated districts are contiguous to the Maine, where a considerable number of high ridges and summits occur, but the absolute height of none of them has yet been determined. In the districts N. of St. John's river the hills are neither so high nor so steep as on the S., and the proportion of level land seems to be greater. The soil in the river bottoms and in the valleys is covered with trees of vigorous growth. This country, like every part of Canada, is watered by numerous streams, all of which flow into the St. John river.

The St. John river has three upper branches, which lie between 46° and 47° N. lat., and W. of 70° W. long., and all unite near that meridian. The St. John, or, as it is here called, the Walloostock, runs for a great distance N.E. parallel to the St. Lawrence, and between 30 and 40 miles from it. By degrees it declines to the E., and is here joined by three large rivers, the Allagash running from the St. and the St. Francis and the Madawaska, both descending from the N. After its confluence with the Madawaska, it turns to the S.E., and after having entered the British colony of New Brunswick, it runs for more than 80 miles within that province in a S. course. Having passed to the S. of 46°, it again turns to the E. and flows 80 miles in that direction, when it again turns S., and after a course of about 60 miles, falls into Fundy Bay with a wide estuary. Its course within New Brunswick is above 230 miles, and nearly as much belongs to Canada. Though descending from an elevated country, this river is more navigable than the others which drain Canada, the lower course of the St. Lawrence excepted. The upper part of its course, though not very deep, and in many parts rapid, is not broken by falls or rapids. Near the mouth of the Madawaska are the little falls, and at its entrance into New Brunswick the great falls, which are 75 feet in perpendicular height. Between them the navigation is easy and practicable for steam-boats. Below the great falls some rapids occur, but they do not appear to be so strong as to interrupt navigation. Vessels of from 50 to 100 tons ascend from the sea to Fredericton, about 100 miles from the mouth.

The whole of the country drained by the St. John is claimed by the American government according to the vague expressions in the treaty of 1783, by which the boundary-line between the United States and Great Britain was determined. The award given by the king of the Netherlands as mediator has not been adopted by either party. Meanwhile English settlements have been formed on both banks of the St. John up to its confluence with the Madawaska, and along the banks of the last-mentioned river, and of the lake of Teniscouata, which is the largest in this portion of Canada, extending in length 22 miles, and varying in breadth from $\frac{1}{2}$ to 2 $\frac{1}{2}$ miles. The road by which Canada communicates with New Brunswick and Nova Scotia by land, passes through these settlements.

The more inhabited parts of Canada lie between 42° and 48° N. lat., but the climate resembles that of the north of Germany and the centre of Russia. The greatest part of the country is covered with snow from two to four or even five months, and most of the rivers with ice for nearly the same time. The frost is sometimes so intense that the thermometer descends to 20° below zero of Fahrenheit, and even more. The heat in summer is very great; the thermometer rises every year to 100° and higher. The mean heat in July varies from 60° to 75°. The prevailing winds are from S.W., N.E., and N.W. The S.W. wind is the most frequent, but generally moderate and accompanied by clear skies; the N.E. brings continual rains in summer and snow in winter; the N.W. is dry, and attended with a great degree of cold. Fogs are almost unknown. Thunder-storms are frequent, and often cause great damage. The aurora borealis is more frequently seen than in Europe, and has a much greater degree of brilliancy. On the great lakes of Upper Canada water-spouts are sometimes formed.

The grains cultivated in Canada are wheat, barley, rye, Indian corn, oats, and buck-wheat. Nearly all the vegetables grown in England can be raised. Fruits do not grow equally well in all districts. At Quebec apples and pears are abundant, but the peach and the grape do not succeed. At Montreal grapes and peaches ripen; but on Lake Erie and districts of Upper Canada, the peach, the nectarine grape, with the other more common fruits, are in perfection. p. flax, and tobacco

in many districts. so extensive cover by far the greatest part of the land

a great quantity of timber. Sugar is from the maple tree, and the spruce-fir is used for making spruce-beer. The domestic animals are horses, cattle, sheep, and swine. The wild animals are deer, moose-deer, bears, wolves, wolverines, foxes, wild cats, beavers, otters, &c. Fish is abundant in the numerous lakes; cod is taken in great quantities in the Bay of Chaleurs, and on some of the neighbouring banks. The herring and salmon fisheries are also considerable. The humming-bird appears in Canada; and the rattle-snake is not uncommon.

Canada is not rich in minerals, yet iron is found in many places, and worked in a few. There are also lead, copper, coal, salt, and brimstone; and also some traces of silver ore. The inhabitants consist of aborigines and European settlers and their descendants. The aborigines are a very small part of the population; they belong to two nations, the Chippeways and Mohawks. The tribes of the Chippeways are dispersed over the countries bordering on Lakes Superior and Huron, and in Upper Canada. The most numerous of their tribes are the Algonquins, who inhabit the country between Lake Superior and the upper course of the Ottawa. The tribes of the Mohawks or Iroquois live in the countries along the St. Lawrence and between the lakes Ontario, Erie, and Huron. A few of them have settled in villages, and embraced Christianity. The rest are hunters, without fixed abodes. Their number is rapidly decreasing, especially in the neighbourhood of the European settlements.

The Europeans are partly English or their descendants, and partly of French origin. The French are chiefly the descendants of Frenchmen settled in Canada before the year 1759, and still form the majority of the population in Lower Canada, especially to the S. of St. Lawrence, where they altogether occupy some counties. On the N. side of the river the number of English is probably equal, if not greater. Upper Canada is inhabited by the English, Scotch, Irish, the number of French families being small, and entirely limited to the country along the Detroit.

The Canadians of French origin have preserved their native language, but they generally speak it incorrectly, and with some intermixture of English words. They are Roman Catholics, and distinguished from the English in usages and manners. They have also preserved their own code of laws, which is that which was in use in the times of the ancient French monarchy, and is called *coutumes de Paris*.

Upper Canada comprehends the countries W. of the Ottawa, with the exception of a small tract at the confluence of the Ottawa with the St. Lawrence, which belongs to Lower Canada. It is divided into 11 districts, which, beginning from the W., follow one another as follows: Western, London, Niagara, Gore, Home, Newcastle, Midland, Johnstown, Ottawa, Bathurst, and Eastern. These districts are divided into 27 counties.

In the western districts, the towns having been only lately founded, are still small. The most important are Goderich, on the Huron lake and the mouth of Matland river; Sandwich and Amherstburgh, on the river Detroit; London, on the Thames; and Sierbrooke, at the mouth of the Ouse. None of them probably have a population exceeding 1000 souls.

On the banks of the lake Ontario are the towns of Toronto or York, and Kingston. Toronto or York, the capital of Upper Canada, and the seat of its governor and parliament, has an excellent harbour called Toronto Bay. Its streets are straight, wide, and regular, and run at right angles. The houses are mostly of wood, except the public edifices. It is a thriving place, with more than 4000 inhabitants.

Kingston is very advantageously situated at the beginning of the Rideau canal and the Cataraqui river. Its harbour is well sheltered, and accessible to vessels not requiring more than three fathoms of water, with good anchorage close to the N.W. extremity of the town. It is the entrepôt of goods between Montreal and all the rapidly increasing settlements along the lakes to the W. In its neighbourhood, in Navy Bay, is the entrepôt of the British navy on lake Ontario. Its population, which in 1828 consisted of 3523 souls, now probably exceeds 5000 or even 6000.

On the Rideau canal is Perth, which in 1828 had only 400 inhabitants, but has rapidly increased of late. At the junction of the canal and the river Ottawa is Bytown on both sides of the canal, which is also a very thriving place.

Lower Canada comprehends the country to the E. and N. of the Ottawa, and on both sides of the St. Lawrence river. It is divided into four districts, Montreal, Three Rivers, Quebec, and Gaspe, which contain 40 counties.

In this province are Quebec, the capital, and Montreal, its

largest commercial town. [Quebec and Montreal.] The other towns are small.

Three Rivers, situated on the N.W. side of the river St. Maurice, at its confluence with the St. Lawrence, had in 1825 only 2453 inhabitants. It has several pot and pearl-ash manufactories, two or three breweries, and an iron foundry, some iron-mines being situated in its neighbourhood. It has some commerce with British manufactured goods, and with the produce of the country, wheat, timber, and peltry.

Sorel, or William Henry, is built at the confluence of the river Chambly and the St. Lawrence, and is a place of some trade with the United States and with Montreal, though it is less important than might be expected from its advantageous situation.

(Bouchette; McGregor; Darby's *Geogr. of the United States*; Bigsby in *London Geo. Trans.*, &c.)

Canada was first discovered by John and Sebastian Cabot, in 1497. In 1525 it was visited by Verazani, a Florentine, who took possession of the country for the king of France. In 1535 Jacques Cartier, bearing a commission from the French king, explored the river St. Lawrence, which he so called from his having first entered it on St. Lawrence's day; but it was not until 1608 that the first permanent settlement, of which there is any record as having been made by Europeans on the continent of North America, was formed by the French under Champlain, on the spot now occupied by the city of Quebec. Settlements had been made about 1601, or the year following, under grants of Henry IV. of France, near the river St. Croix, and at Port Royal; but these settlements were broken up in 1614, owing to a successful attack upon them by Sir Samuel Argal. Quebec surrendered to the English under Kirk, in 1629, but was immediately restored to France, peace having been established with that country in April of that year. In 1663 the colony was constituted a royal government, and the governors were thenceforth appointed by the king. Canada continued a possession of France until 1759, in which year Quebec was taken by General Wolfe, and the province was ceded in full sovereignty to Great Britain by the treaty of Paris, in 1763. From that time until 1774 the affairs of Canada were regulated by the ordinances of the governor alone, but in that year, under an act of parliament called the Quebec Act, a legislative council of 23 members was appointed by the king. In 1791 the form of government was again altered; the executive power was continued in the governor appointed by the crown, and two legislative chambers were formed; the members of the council or upper chamber were appointed by the king for life, and the lower chamber or assembly was composed of persons elected every four years by the proprietors of the soil. The legislative council, which was originally composed of 15 members, now consists of nearly double that number; and the assembly has had its numbers augmented from time to time, owing to the increasing extent of the settlement, until at present the house contains 83 members.

Another body, to which the name of Executive Council has been given, and which is composed of 15 members appointed by the crown, acts as the privy council of the governor, and in that capacity exercises a direction over the internal affairs of the province.

From the year 1820 to the present time, dissensions have existed between the House of Assembly of Lower Canada and the executive government, which, with some intermissions, have been continually increasing in violence until, to use the words of Lord Glenelg, the colonial secretary of state, 'they have at length advanced to such a height as not only to invade the peace of society, but nearly to paralyse the activity of the executive government, threatening with the most fatal confusion a country exempt beyond the common lot of nations from the influence of the ordinary causes of social evil.' One of the main sources of this disunion is the claim of the House of Assembly, as representatives of the people of Lower Canada, to the right of appropriating to the public service, according to their own discretion, the whole of the revenues of the crown accruing within the province. This claim extends to the proceeds of all parliamentary and provincial statutes, whatever may have been the original conditions of these grants; to the funds drawn from the sale of timber and of the waste lands of the crown; to all fines and forfeitures, and to the income derived from the seigniorial rights inherited by the king from his royal predecessors.

of Assembly claims further the right to

regulate the settlement and alienation of the land in the colony. It complains of the constitution of a body for appointing the Legislative Council, a body which has hitherto possessed a co-ordinating right of legislation with representatives of the people, and the members of which have invariably been nominated by the executive government, which is said to have appointed to seats in the council a preponderating number of persons who are under the immediate control or influence of the government. Instead of a second legislative chamber thus constituted, and which is said to be, in effect, the executive power under a different name, the House of Assembly requires that the members of the legislative council should be chosen by the people, and declares that all remedial measures will be futile and unsatisfactory which should stop short of rendering the seats in the legislative council dependent on a popular election. On this subject the assembly has proposed that public conventions, or, as they are termed, primary meetings, shall be held in every part of the province, in which meetings the proposed alteration shall be discussed by the people at large.

Complaint is also made of the composition of the executive council. It is maintained that 'the members of that body are incompetent to the proper performance of the judicial duty with which they are charged, and unfit to act as the confidential advisers of the governor in their more appropriate office of aiding in the execution of his administrative authority.' The evil consequences of this unfitness are said to have been 'the habit of appealing with inconvenient frequency to the secretary of state on many questions which might more advantageously have been disposed of in the province itself, thus causing much needless delay in the dispatch of public business, and bringing the supreme executive authority into needless collision with individuals and with the two houses of legislature.'

One source of disagreement in the colony arises from the fact of the population being divided into two distinct races. By far the most numerous of these races consists of the descendants of the French colonists, who, though they have now lived for more than three quarters of a century under the British government, still consider themselves as having interests different from those of the more recent English settlers, and it is probable that this feeling may have been fostered by the difference in the tenures by which their property is held; the estates or seigneuries of the French Canadians being fiefs, while the townships of the English settlers are granted in free socage. Under the principle adopted in 1792 for regulating the return of members to the provincial parliament, the numerical superiority of the French Canadians has insured them a considerable majority in the House of Assembly, while, on the other hand, the legislative council being nominated by the government, a majority of its members has consisted of persons attached to the English party. The consequence has been that the two chambers have been frequently in a state of opposition to each other, and various important bills which from time to time have been passed in the one house have been negatived in the other. It is with a view to remedy this evil that the House of Assembly insists so firmly upon an alteration in the constitution of the Legislative Council. The Canadians further urge that the province contains no aristocracy, the members of which by their great possessions and influence command respect and deference from other classes; and that this state of society being similar to that existing in the United States, the constitution of the legislative council should be assimilated to that of the American senate.

Among other causes of dissatisfaction are the assumption on the part of the crown of the right to administer certain estates formerly held by the order of Jesuits, and the interposition of the imperial parliament in the establishment of the North American Land Company, which is felt as 'an unnecessary interference with the authority of the local legislature over the internal affairs of the province.'

For the investigation of these various grievances, a select committee of the House of Commons was appointed in 1828. Having examined various persons connected with the colony, this committee presented a report, in which various measures of a conciliatory nature were recommended; and it appears from the report of another committee, appointed in 1834 to inquire how far these recommendations had been carried into effect, that considerable efforts had been made for that purpose by the home government, through the governor of the province, having failed, a board of commissioners, consisting

of Gosford, who was at the same time appointed governor, and of other members, were sent to Canada, in order to inquire into the various grievances, with a view to the redress of such as should appear well founded and to a friendly adjustment of the differences. The instructions given by government to the commissioners have been printed by order of parliament, from which it appears that, as to all questions purely financial, the home government is disposed to concede all the claims of the House of Assembly, provided the Assembly will pass a law making permanent provision for the payment of the judges, and for providing a civil list for a limited number of years, so that the colonial functionaries may not be continually dependent upon the pleasure of the provincial parliament. With respect to the territorial revenue and the management of the uncleared territory, it is stated in the instructions given to the commissioners as the decided opinion of the secretary of state, that 'in the distribution of the different powers of the state, the office of settling and alienating the uncleared territory properly belongs to the executive government, and that his Majesty's confidential advisers regard as conclusive and unanswerable the objections which are made to confiding the management of the uncleared territory to either or to both of the houses of general assembly, or to persons appointed by them and subject to their control.' It is on the other hand admitted that it is not necessarily incompatible with the intelligent, faithful, and punctual execution of the duty of managing the crown lands that the revenue derived from them should be placed at the disposal of the legislature. With reference to the constitution of the legislative council, the commissioners are instructed to ascertain how far that body has answered the original objects of its institution, and to consider of what amendments it may be susceptible, and a promise is given that upon receiving the report of the commissioners, 'his Majesty will take into his most serious consideration the question whether there are any amendments in the law upon this subject, which it would be fit to propose for the consideration of the imperial legislature.'

The commissioners of inquiry were appointed in July, 1835, and proceeded soon after to Canada. It is understood that they have hitherto met with difficulties in the adjustment of the differences, but as no formal report has yet been made by them to the government, it would be premature at this time (June, 1836) to offer any opinion as to the ultimate result of their mission.

The misunderstandings between the colonists of Upper Canada and the home government are of recent origin. In the autumn of 1831, after a general election of the house of assembly, among the earliest measures adopted by the new house was the appointment of a committee of grievances, by which body a report was made impugning the administration of affairs in every department of the public service, and calling for remedial measures of such magnitude and variety as apparently to embrace every conceivable topic of complaint. This report was adopted and published by the house, and transmitted through the lieutenant-governor of the province to the king.

The principal grievances of which complaint is made in this report are:—1. The almost unlimited extent of the patronage of the crown, or of the colonial minister and his advisers in the colony, and the abuse of that patronage. 2. The mode of conducting the business of the provincial post-office. 3. The excessive amount of salaries and fees enjoyed by public officers. 4. The amount of the pension list. 5. The provision made for ecclesiastical establishments, and for the maintenance of the teachers of religion of various denominations. Under this head the house of assembly complains of the conduct of the government in attempting to uphold particular religious sects by money grants, and refers to declarations made by preceding provincial parliaments that 'the assembly recognizes no particular denomination as established in Upper Canada, with exclusive claims, powers, and privileges.' 6. The regulations and practice pursued in the land-granting department. 7. The great expense of the collegiate institutions of the province, and particularly of the Upper Canada college, from which it is alleged 'the province in general derives so little advantage, that it might be dispensed with.' 8. The unsatisfactory mode of expending the money granted in aid of emigration from Europe, and the impossibility of a proper examination respecting the same on the part of the agent system of auditing the holding of public accounts. 9. A failure on the part of

the lieutenant-governor to show respect to the wishes of the house of assembly. 12. Neglect on the part of the local government to carry into effect certain recommendations of the secretary of state, the adoption of which would be satisfactory to the colonists. Among these recommendations are an amendment of the election laws, the non-interference of government officers at elections—the disclosure to the house of assembly of the receipt and expenditure of the crown revenue—the exclusion of ministers of religion from the legislative and executive councils—the reducing the costs of elections, the judicial independence, and the limitation of the number of public officers who may sit in the assembly. 13. The partiality towards persons of a peculiar bias in politics shown by the colonial government in selecting justices of the peace. 14. The virtual irresponsibility of the executive government of Upper Canada, and the consequent impossibility of obtaining a good and faithful administration of public officers. 15. The unsatisfactory constitution of the body of legislative councillors; and 16. The absence of control by the assembly over the territorial and casual revenues of the crown.

Since the transmission of this report from the colony a change has been made in the appointment of the lieutenant-governor. Sir John Colborne has returned to Europe, and has been succeeded in his office by Sir Francis Head, who has carried with him instructions of a conciliatory nature, a compliance with which appears calculated to remove or redress the greater part of the sixteen heads of grievance of which complaint was made by the house of assembly. It will be seen that as regards many of these grievances they are not in their nature very difficult of arrangement, and in the published instructions furnished to Sir Francis Head, they appear to be, for the most part, met in a spirit of liberal concession. As regards the objection taken against the number of government officers in the colony, it is urged that in Upper Canada, as in other new countries, the number of public employments must be larger in proportion than in older and more densely-peopled states, since the general machinery of government must be the same in a sparsely as in a large and redundant population. And it is further stated that in a new country there will, besides, be some establishments for which in settled states no counterpart can be found—such, for example, as relate to the allocation, surveying, and granting of wild lands.

It is also objected by the home government that officers who should be appointed through a popular election would be virtually exempt from responsibility, and that from such a mode of appointment would result a want of unity and subordination which are necessary for the satisfactory carrying on of the government. Coupled with the expression of these opinions are instructions to enter into a diligent review of the offices in the appointment of the crown and local government with a view to their reduction and to an inquiry how far it may be safe and wise to transfer the patronage to other hands.

As to the 5th head of grievance—that relating to the provision made for ecclesiastical establishments—it appears to be the present policy of the home government to await the issue of this conflict of opinion rather than to interpose for its settlement the authority of the imperial parliament, a course to which they are urged by the legislative council. 'We must not,' they say, 'have recourse to an extreme remedy, merely to avoid the embarrassment which is the present though temporary result of our own deliberate legislation.'

The subject of the Upper Canada or King's College is also a cause of disagreement, as to which the mediation of the king is offered for reconciling the conflicting opinions of the council and assembly, being made to modify the conditions of the charter, a proposal so as to suit the wishes of both houses.

The 5th, 9th, and 10th heads of complaint are met in the instructions in a way that must be satisfactory to the colonists. The 11th is of a personal nature, and has now ceased. As regards the 12th, the new lieutenant-governor is expressly directed to adhere, 'without reserve or qualification, to all the instructions issued by Lord Ripon, when colonial secretary of state. The attention of Sir Francis Head is called to the 13th grievance with a view to his avoiding any such abuse in the administration of his government.'

The other causes of complaint urged by the house of assembly, with the exception of the 15th and 16th, appear to be comparatively unimportant, or to depend for their remedy upon the satisfactory arrangement of some one or other of the heads that have been more particularly noticed.

In commenting on the 15th and 16th subjects comprehended in the list of grievances, Lord Glenelg, the secretary of state, by whom the instructions to the lieutenant-governor are drawn up, says: 'On these subjects I am, to a considerable extent, relieved from the necessity of any particular investigation, because claims precisely identical have been preferred by the assembly of Lower Canada, and because, in the instructions to the commissioners of inquiry who have visited that province, I have already had occasion to state the views which have received his majesty's deliberate sanction. The principles of government in the two sister provinces must, I am well aware, be in every material respect the same; I shall therefore annex for your information so instructions to the Earl of Gosford and his colleagues as applies to these topics.'

The promulgation in the province of the instructions given to Sir Francis Head, and his proceedings in conformity with the same, do not appear hitherto to have done much (if indeed they have done anything) towards bringing about a settled state of affairs, and renewed remonstrances on the part of the assembly have very recently (1836) been presented to the House of Commons.

LOWER CANADA (STATISTICS OF).

The population of the province of Lower Canada, according to the census of 1830, amounted to 511,917 souls. A previous enumeration, made in 1825, gave 423,630, showing an increase from natural causes and from immigration, of 88,287, which is 19½ per cent., or rather more than 20 per cent. annually. There is reason to believe that the population as given in the returns of 1825 was below its true amount, the heads of families having understated the numbers of their household, in consequence of the doubts entertained as to the views of the colonial legislature in instituting the census. The enumeration of 1831 has been noted with great minuteness of details, but several discrepancies are observable in the tables, and we cannot therefore place entire confidence in their accuracy. The number of inhabited houses in the province is stated to have been then 82,437; the number being built 1458, and vacant 1542; together 85,437. The number of proprietors of real property is given at 57,891; and the extent of land occupied by them at 3,981,793 statute acres. The number of persons living in 1831 who were deaf and dumb is stated to have been 408; the blind 334; and the insane 924. The great bulk of the inhabitants profess the Roman Catholic creed; the number of these in 1831 was 403,472; the persons in connexion with the Church of England were 34,620; those belonging to the Church of Scotland amounted to 15,969; there were only 107 Jews; the remainder of the population were Methodists, Baptists, Presbyterians not in connexion with the Church of Scotland, and other sects.

The number of families employed in agriculture was 50,824, employing among them as farm-servants only 7602 persons. There were in the same year (1831) 2503 families engaged in commercial pursuits, and 1282 persons subsisting on alms. The following additional particulars given in the returns made to the House of Assembly of the province in 1831, throw some further light upon the habits and occupations of the people:—Number of taverns, 1035; stores where spirituous liquors are sold, 857; grist mills, 395; saw mills, 737; oil mills, 14; falling mills, 97; carding mills, 90; iron-works, 103; trip-hammers, 18; distilleries, 70; pot and pearl-ash manufactories, 489; manufactories of any other sort, containing machinery moved by wind, water, or animal power, 64.

The number of emigrants who arrived at Quebec in each of the seven years from 1829 to 1835 inclusive is shown in the following table.

Where from	1829.	1830.	1831.	1832.	1833.	1834.	1835.
England and Wales . . .	3,663	6,799	10,343	17,481	5,198	8,799	3,067
Ireland	9,614	18,300	31,133	24,204	12,013	19,306	
Scotland	2,643	2,450	5,384	5,500	4,504	4,591	2,127
Hamburg and Gibraltar .							
Nova Scotia, Newfoundland, West Indies, &c	123	451	494	546	315	339	225
Total in 7 years.	15,945	28,000	55,354	51,746	21,732	30,935	12,527
				211,150			

The majority of the emigrants passed to the upper

two years have not been given; but in 1834 and 1835 the persons so remaining in the province were 4090 and 2287 respectively.

The 'movement' of the population in the years 1833 and 1834 was as follows:—

	1833.	1834.	Proportion to Population,*	1833.	1834.
Births	25,247	26,114	1 in 22½	1 in 19½	
Marriages	4,781	4,598	1 „ 107	1 „ 111	
Deaths	10,793	15,714	1 „ 47	1 „ 32½	

The proportion of births is much greater than that which occurs in old and well-peopled countries, and, as a necessary accompaniment, the proportionate number of deaths is greater also; the principal mortality occurring at the earliest periods of life.

The province of Lower Canada is divided into three chief districts—Quebec, Montreal, and Three Rivers; and two inferior districts—Gaspé and St. Francis. These districts are sub-divided as under:—

	Counties.	Seigniories.	Fiefs.	Township
Quebec district	13	79	12	38
Montreal „	19	70	6	59
Three Rivers „	6	25	9	53
Gaspé „	2	1	6	10
	40	175	33	160

The inferior district of St. Francis contains 39 townships, which are included above with the townships of Montreal and Three Rivers.

The following table shows the highest, lowest, and mean temperature, and the state of the weather, observed in each month of the year.—

MONTH.	Temperature by Fahrenheit's Thermometer.			State of the Weather.		
	Maximum.	Minimum.	Mean.	Clear.	Rain or Snow.	Cloudy
January	33	23	11.14	23	4	4
February	40	29	10.69	31	3	4
March	47	26	12.13	25	3	3
April	61	9	48.91	25	3	2

June	96	53	76.31	26	2	2
July	103	62	85.23	26	3	1
August	100	58	74.7	16	12	11
September	90	30	59.16	18	8	4
October	55	0	32.24	16	5	10
November	40	13	17.44	14	7	9
December	43	21	11.94	23	2	6
				256	56	53
					21 Snow.	
					35 Rain.	

In 1831, the number of cattle throughout the provinces was 369,706; the number of horses, 116,686; of sheep, 543,343; and of hogs, 295,137. The quantity of agricultural produce raised during that year was as follows, stated in bushels:—Wheat, 3,208,075; peas, 984,198; oats, 3,153,597; barley, 393,382; rye, 235,010; Indian corn, 2,10,073; potatoes, 6,139,221; buckwheat, 105,811.

The number of domestic looms is estimated in the government returns at 13,400, and their annual produce is assumed to be—

Coarse cloth	about 1,400,000 yards.
Ditto flannel	981,000 „
Linen	1,366,720 „

There is one manufactory for making cloth which employs twenty persons.

The produce of the fisheries was valued in the three years 1832 to 1834 as under:—

	1832.	1833.	1834
Codfish	£28,231	£27,536	£46,337
Salmon	2,488	723	2,337
Herrings	1,032	318	489
Mackerel	212	91	382
Alewives	290	325	...
Fish oil	1,038	2,290	1,500

33,291 31,283 51,165

There are 78 free schools established in different parishes about the province, and 3578 children were receiving instruction in 1832. The expense of these schools, £5,

Calculated upon the census of 1831.

the provincial government, in that year was 18954. 22. Two grammar schools, one at Quebec, the other at Montreal, receive annually 342 each from the public funds. Twenty free scholars are admitted into each of these schools. There are also 1062 schools established 'under an act of the provincial legislature, and in these schools 48,302 scholars of both sexes were receiving instruction in 1832, being about one-half the number of persons in the province between the ages of five and fourteen years. Several colleges in connexion with the Roman Catholic Church exist in different parts of the province, as well as a considerable number of private schools, in which the higher branches of education are taught, but not any statement of their number or situation has been given.

The ecclesiastical establishment of Lower Canada consists of the bishop of Quebec—who has spiritual jurisdiction in the Upper Province also—an archdeacon of Quebec, a rector of every parish, and a minister to each 'mission.' There are at present only ten districts within the province that have been formed into parishes, included in these are Quebec, Montreal, Three Rivers, and St. John's. The remaining districts are called missions, and the stipends of the clergy are paid through the Society for Propagating the Gospel in Foreign Parts, to which an annual parliamentary grant is made for the purpose. There is also a Roman Catholic bishop of Quebec, whose salary of 1000*l.* per annum is paid out of the rents of some public property.

In every part of the province there are places of public worship for persons dissenting from the Church of England. In the seigniories, the great mass of the inhabitants are Roman Catholics, while in the townships a large number are Protestant dissenters, or in communion with the Church of Scotland.

The number of men embodied in the militia for the defence of the province, in 1833, was as follows:—

DISTRICTS.	Number of Battalions	Number of Companies	Number of Militiamen 18 to 59 years of Age.	Grand Total of Militia.	Number of Muskets.
Quebec	26	297	29,746	29,746	8,436
Three Rivers	8	87	8,709	8,709	2,201
Montreal	46	559	47,377	47,377	9,718
St. Francis	5	71	6,215	6,215	130
Gaspé	3	26	2,450	2,450	...
Total	88	1,040	94,377	94,337	9,004

The external trade of the province is carried on at the ports of Quebec, Montreal, St. John's, Coteau du Lac, and Stanstead. The number and tonnage of the ships, &c., that entered these ports in the year 1834 was as under:—

	Great Britain.		British Colonies.		United States.		For Countries.
	Vessels.	Tonnage.	Vessels.		Vessels.		Tonn.
At Quebec	858	256,912	196	27,974	20	6,700	4874
„ Montreal	73	18,576	13	1,298	396	69,128	
„ St. John's					Car- rages, 754	37	
Coteau du Lac			Scho- ners, 73	4,890	68	8,790	
			Barges, 64	27,279	217	7,465	
			Rafts, 111	65,600	90	72,000	
			Winter Car- riages, 1817				
Stanstead	1	1			Car- riages, 398	199	
	931	275,518	2974	127,034	1933	139,709	20,5249

The customs duty collected in 1834 amounted to 84,184*l.* 10*s.* 17*d.*, of which sum 56,011*l.* 8*s.* 7*d.* was allotted to Upper Canada, the external trade of that province being carried on through the ports of Quebec and Montreal.

From the United Kingdom Canada receives coals, metals, bridges, East India produce, and the various kinds of

are to the amount of 300,000, and 50,000; and of wheat, 230,000. In the colonies, sugar, molasses, coffee, received from the United States, and beef and pork, biscuit, rice, and tobacco. The total value of the imports in 1833 was 1,665,144. The exports of Canada are:—To the United Kingdom, pot and pearl ashes, wheat and flour, and timber in its various forms. To the West Indies, beef and pork, beer, grain, and flour. To the United States the export trade, of which any record appears at the custom-houses, is very trifling. The total exports of the colony in 1833 amounted to 965,026.

UPPER CANADA. The population of the counties of the upper province in 1834 was as follows:—Ottawa, 6335; Barn, 23,105; Johnstown, 28,061; Bathurst, 22,079; Midland, 44,332; Newcastle, 27,104; Home, 55,540 (including Toronto, 9252); Niagara, 27,347; Gore, 31,618; London, 38,330; Western, 12,752. Total, 321,903.

The following table exhibits the area in square miles of each county, the number of acres cultivated and uncultivated, and the number of stock in 1833:—

Name of the District.	Area in square miles.	Number of cultivated and uncultivated in each dist.	No. of acres uncultivated.	Stock, number of	Nature of the produce and price thereof.
Ottawa	1,118	13	103,920	413	1,806
Barn	1,825	68,564	350,501	4,477	12,526
Johnstown	4,630	78,043	320,366	3,383	14,911
Bathurst	1,700	68,450	344,425	1,283	10,849
Midland	3,492	165,594	438,769	7,450	24,894
Newcastle	3,024	48,127	400,873	2,568	13,786
Home	8,672	141,393	619,866	5,274	24,980
Niagara	1,058	111,721	339,052	4,887	17,211
Gore	1,032	137,579	488,398	4,431	21,295
London	8,204	111,230	501,291	3,767	19,915
Western	1,923	39	201,610	2,168	7,434
Total	34,020	988,957	4,205,256	40,417	172,674

The number of men embodied in the militia in 1834 was 39,499, including commissioned and non-commissioned officers; the number of regiments was 63, of troops of cavalry 14, and companies of artillery five.

There are in Upper Canada 475 grist-mills and 670 saw-mills. Whisky distilleries are numerous, but the exact number has not been ascertained. The domestic manufacture of woollen goods is commonly carried on. There are two paper-mills, one in Home, the other in Gore district. Several iron-works are maintained in Western, London, and Midland districts. Extensive beds of gypsum are worked on the banks of Grand River in Gore district.

A salary of 100*l.* per annum is assigned by the legislature for a school master in each district. A school is consequently maintained in each for teaching the common branches of knowledge. A further sum of 250*l.* is appropriated for the maintenance of common schools in each district. These common schools are very numerous, and at least 18,000 children, male and female, are taught in them. The funds first mentioned as having been provided by the Assembly for this purpose having been found wholly inadequate to the object, the grant was enlarged in 1832 to each district according to its population, and the sum voted amounted to 8550*l.*

The Upper Canada College, situated at Toronto (formerly York), the capital of the province, has a royal charter of incorporation, and is established for teaching classical, mathematical, and the more general branches of knowledge. The college is under the control of the lieutenant-governor of the province as visitor, and has an establishment consisting of a principal, a classical and a mathematical master, as well as masters for teaching French, writing, arithmetic, and drawing. No tests or subscriptions of articles are required from the pupils, but it has been objected that those to whom its management has been intrusted have contrived by their regulations to confine the advantages of the institution too exclusively to the members of the Church of England; a course of proceeding which has formed the ground of complaint against the colonial government on the part of the House of Assembly.

The number of churches and chapels in the province in 1834 was as under:

District.	Episcopal churches.	Presbyterian churches.	Church of Scotland.	Roman Catholics.
Eastern	4	4	1	3
Johnstown	4	1	2	3
Bathurst	5	6	2	3
Midland	7	2	2	3
Newcastle	4	1	0	2
Home	4	3	1	2
Gore	4	5	1	2
Niagara	5	1	1	2
London	4	1	1	2
Western	4	1	0	3

27

The ecclesiastical establishment consists (in addition to the bishop of Quebec) of the archdeacons of York and Kingston, and of resident ministers to each parish: there is also a Roman Catholic bishop under the title of bishop of Ratiopolis: his salary of 500*l.* per annum, and about for the support of priests of that persuasion, are paid by government. The salaries of ministers of the church of Scotland are paid partly by government and partly by the several congregations. Other dissenting ministers depend upon the subscriptions of their congregations.

A joint-stock company, under the title of the Canada Company, was incorporated in 1826 by an act of the imperial parliament, and by a royal charter; to which company his Majesty was empowered to grant or sell certain portions of the lands reserved for the crown and clergy in the province of Upper Canada. This company, having obtained subscriptions to its capital amounting to one million sterling, purchased from the government upwards of 2,300,000 acres of land; 1,300,000 acres of this purchase consisted of tracts of various sizes from 200 to 40,000 acres each, in various townships; the remaining million of acres, composing a section of territory on the shores of Lake Huron, and known as the Huron Tract, was assigned in lieu of the moiety of the clergy reserves scattered through the different townships of the province. For this territory the company covenanted to pay in sixteen annual instalments the sum of 295,000*l.*, or about 2*s.* 6*d.* per acre: the last of these annual payments is to be made in the year 1842. By its contract with the government, the company is authorized to expend the sum of 45,000*l.*, part of the purchase-money, under the sanction of the provincial government, or of the secretary of state, in the construction of roads and other works of public utility within the Huron Tract. This tract is situated on the E. and S.E. shores of Lake Huron, along which it extends 60 miles, being about 40 miles at its nearest point from the head of Lake Ontario, and 30 miles from Lake Erie.

By the establishment of this company a considerable impulsion has been given to emigration from this country, and to the settlement of many parts of the province. Two thriving towns, Guelph and Goderich, have been founded: the first of these is in the county of Halton, Gore district, upon the river Speed, a branch of the Ouse or Grand River, and communicating through it with Lake Erie. Goderich is on the borders of Lake Huron, at the mouth of the river Maitland, which forms a commodious harbour. The village of Galt, also in Halton county, and 17 miles from Guelph, is another settlement of the Canada Company.

The British American Land Company, the incorporation of which by the imperial parliament forms a ground of complaint on the part of the Assembly of Lower Canada, has purchased from the government nearly one million of acres of land, situated in what are called the Eastern Townships of Lower Canada, and forming part of the counties of Shefford, Stanstead, and Sherbrook. Part of the lands thus purchased, amounting to 300,000 acres, consist of the crown and clergy reserves, and are for the most part in detached lots or farms of 200 acres each. Another part consists of the St. Francis territory in the county of Sherbrook, and comprises about 800,000 acres in one large tract or block of land. Part of the purchase money (50,000*l.*) stipulated to be paid by the company, is to be expended in public works and improvements, such as roads, bridges, canals, school-houses, and churches within the districts.

CANADA GOOSE. [Goose.]

CANADIAN SEAS, a term that has sometimes not in-

aptly been used to designate the Superior, Huron, &c., which St. Lawrence. As the term large river mainly belongs to include the description of the Canadian Sea and the St. Lawrence under the general description of CANADA.

fresh-water lakes, the basin of the the basin of the is most convenient

as from present. It appears likely that the greater cost of constructing a maintaining railroads will in general propose a higher toll upon goods conveyed by them than is sufficient to pay the proprietors of canals, there is little reason to suppose that existing canals will be abandoned.

CANALS. [VAISSETHICA.]

CANAL, an artificial channel filled with water, which in modern times is usually formed in order to make a cheap and easy mode for the conveyance of goods. Canals have sometimes been made for the purposes of irrigation, and of supplying towns with water. The New River, by which London is in great part provided with water from Hertfordshire, is a canal. The canals by which ancient Egypt was intersected were used both for the purposes of navigation and irrigation. Canals are known to have existed in China before the Christian era; but since the acquaintance of Europeans with that country, no improvement has been made in their construction.

The word canal comes from the Latin 'canalis,' which seems to signify properly any tube adapted to convey a liquid: afterwards it seems to have been used pretty nearly in the sense of our word 'canal,' (Suetonius, *Claudius*, 20) though the proper Latin word for canal is 'fossa.' Canalis is in fact an adjective form, and is evidently derived from *canna*, a reed or pipe. The first canal made in Europe, so far as we know, was that cut by Xerxes across the low isthmus of Athos. [ATHOS.] Canals were made by the Romans in Italy and in the Low Countries about the outlets of the Rhine; and we have good reason for believing that they also made canals in Britain. But canal-making in modern Europe was first practised by the inhabitants of North Italy and Holland. Works of this kind, which are still much admired by engineers, were executed in Lombardy between the 11th and 13th centuries; they were principally intended for irrigation: the canal from Milan to the Tesino was made navigable in 1271. The construction of canals was begun in the Netherlands in the 12th century, when Flushing became the commercial entrepôt of Europe. Holland is intersected with canals, which for number have been compared to the public roads in this country.

The origin of English canals dates from the year 1755, when an Act of Parliament was passed for constructing one 17 miles long from the mouth of Sankey-brook, in the river Mersey, to Gerard's Bridge and St. Helens. Before this work was finished, the Duke of Bridgewater commenced his canal between Worsley and Manchester. [BRIDGEWATER, DUKES OR, and BRINDLEY.] The aggregate length of the navigable canals of England alone now exceeds 2200 miles. In addition to making canals, such of the rivers as are capable of it have been made navigable, so that there is no spot in England south of Durham which is more than 15 miles distant from water-communication; and in those districts which are the principal seats of manufactures, that distance is often smaller; while every considerable town of those manufacturing districts has this means of cheap and easy conveyance for receiving the raw materials which it employs, and for distributing to other parts of the country and to the sea-ports the finished products of its industry. A few years ago, when the introduction of iron railroads became a favourite speculation, it was supposed that canals would no longer be wanted; that not only would a stop be put to the construction of any new canal, but that many at present in use would be drained and converted into lines for railroads; but independent of other considerations, no proper estimate was formed of the expense of maintaining a railroad in perfect repair, and experience has hitherto shown that even where the latter mode of transport has been most successfully introduced, it has not injuriously interfered with the profits of canals. At the present time (1836), when so great progress has been made towards the completion of a railway between London and Birmingham, a project has been brought forward, and is supported by men of great commercial weight and influence, for the construction of a new canal, commencing at the Stratford-on-Avon Canal in Warwickshire and ending at the Regent's Canal, London, for the conveyance of goods, the use of which is small compared with their weight, and which will not therefore bear the higher toll required for maintaining the railway. For goods of this description, which form a very large portion of the traffic carried on throughout the country, the expedition attained by the railway is not required;

In a level country like Holland, the cutting of a canal is comparatively easy; the work may generally be carried forward in a straight line, and none of the costly expedients of deep cutting, tunnelling, or lock-making, are necessary. But even where the surface of a country is level, difficulties may be presented by the nature of the soil through which the cuttings are made, and by the insufficient supply of water. Where the soil is composed of sand, gravel, or rock, or other matter, through which water will percolate it is necessary to line the floor and the sides of the canal with some substance of a different quality. This process, which is called *puddling*, is thus performed: a mixture is made, generally of lightish loam and coarse sand or fine gravel; this mixture must be reduced to a semifluid state, and well worked with a spade until it is made homogeneous, in which state it is applied in three or more strata to the depth or thickness of about three feet. The first stratum, about ten or twelve inches thick, is first allowed to set, when another course of about nine inches is applied, and so on until the requisite thickness has been attained, care being taken so to work the puddling stuff at each time as to unite it with the stratum immediately below. Over the top course of puddling stuff, a layer, one and a half or two feet thick, of common soil must be laid. Strong clay, which, under certain circumstances, is retentive of water, will not answer for puddling, because of its tendency to shrink and crack, neither will it answer to employ as puddling stuff any soil which contains roots or other organic matter, which would decay and leave cavities. Attention to the proper performance of this work is necessary to insure the constant efficiency of the canal, and to prevent damage to the land through which it passes, by reason of the continued escape of water. As a further security against leakage through the sides of the canal, it is usual to cut mud ditches in each of them, to which the name of puddle ditches or puddle gutters is given. These ditches are usually about three feet wide; they must be carried down perpendicularly below the bottom of the canal, and must be a few inches higher than the top water-line. They are filled gradually with puddling stuff, and, when properly made, form an effectual barrier to the passage of water through the banks.

The sides of the canal, where they are above the level of the adjacent country, are formed out of the soil thrown out of the bed of the canal; and if this should be of a light and porous nature, it is necessary not only to render it impervious to water, but also to adopt means for giving it stability. This is best effected by covering it externally with turf.

Another important matter in canal-making is the securing of a sufficient supply of water at all seasons, in order to make up for waste by evaporation and otherwise.

The difficulty in providing a sufficient supply will be partly understood when it is considered that a canal as well as through the other parts of its construction this purpose it is necessary, when marking out the line, to ascertain the situation and capability of every rivulet within the requisite distance, as well as to make arrangements with the owners or occupiers of the same mission to appropriate their waters to the purpose of supplying the canal, or for the filling of reservoirs. It will happen that such reservoirs must be constructed at a higher level than the streams or springs from which they are to be supplied; in which case it will be necessary to erect steam-engines to throw up the water to the summit level of the canal. Similar reservoirs will be necessary at different points below that level, in order to supply the unavoidable waste of water at the locks. Such reservoirs are also necessary, because the proprietors of a canal are always required to compensate the owners of mills, placed lower down the streams, for the water which is taken nearer their sources for feeding the canal. The size of a reservoir must of course be regulated by the quantity of water which, from the nature of the adjacent country, may be expected to drain into it. In its construction it is necessary, when the soil is porous, to adopt the same means for making it water-tight as have already been described in speaking of the canal. Seasons of course occur when reservoirs, which are in general of

ample dimensions, will be too small that drains into them, and provide made for letting off the surplus in prevent injury to any land.

It is also necessary, where the nature of the soil requires, to puddle the channels of the various springs and brooks, which act as feeders to the canal. In order to avoid great inequality of surface, or a circuitous line through cultivated lands, it is sometimes necessary to convey the water through bricked culverts. In many cases cast-iron pipes have been found cheapest, as for instance, where the feeders must be carried across valleys or other streams.

In cases, where there is no means uncommon, where the water must be carried across a stream or a deep valley, a bridge is indispensable. The late Mr. Telford, first engineer who constructed an aqueduct of cast-iron which forms part of the Shrewsbury Canal where it crosses the valley of the Tern at Long Mill, and is 186 feet in length. With the exception of the nuts and screws used for holding together the plates at their flanches, and which are made of wrought-iron, the material of which this aqueduct is constructed is wholly cast-iron. It was apprehended that the great alternations of heat and cold to which the iron would be exposed, would have caused such a degree of expansion and contraction as would have torn off the flanches and broken the plates; but this fear has proved groundless, and the advantages of iron over masonry for this purpose are in many respects so great, that the example of the Long Aqueduct has since been frequently followed. A stupendous work of this kind was executed about twenty years ago at W. of Chester, where the Ellesmere and Chester Canal is carried over the Dee at Pont-y-Cysyllte. This aqueduct is at an elevation of 125 feet above the bed of the river, and consists of nineteen pairs of stone-pillars, fifty-two feet apart. The length of which forms the canal is 988 feet long, twenty feet wide, and six feet deep, and is composed altogether of 1,000,000 lbs. of stone.

In the construction of a canal, recourse is had to tunnelling, or the formation of underground channels, where the elevation of the surface would make a long circuit necessary, or where it would be difficult to convey a sufficient supply of water to the level of the canal. Some of these cuttings are of great length. The tunnel at Blisworth, on the Grand Canal, is 3080 yards in length. The underground cutting of the Duke of Bridgewater's Canal are said to be 18 miles long, and to have cost 170,000l. The tunnel at Sapperton, in the Thames and Great Ouse Canal, is two miles and three-eighths in length, and is the highest point of the hill through which the canal is made. In the Thames and Medway Canal, between London and Rochester, a tunnel two miles and one-fifth in length is cut through the chalk; and one of the tunnels of the Leominster Canal at Pensax is 3850 yards long. Besides these, there are many similar cuttings of smaller dimensions in different parts of the kingdom.

The invention of locks, as a means of carrying canals through uneven country, is said to be modern, and yet controversy has arisen in regard to the country in which it was first adopted. Belidor, in his 'Architecture des Eaux', attributes the invention to the Dutch; but it is generally supposed to be the contrivance to which he refers was a very ancient one, and had little resemblance to what are now understood by locks. The invention has been also claimed for the Chinese, and it is stated that Leonardo da Vinci, the painter, applied locks in 1497 in the Milanese canals.

A lock is a chamber formed of masonry, occupying the space between two gates, the difference of level is to be overcome. This chamber is so contrived that the level of the water which it contains may be made to coincide with either the upper or lower level of the canal. This is effected by the pair of gates, one of which pairs is placed at each end of the chamber of the lock. By this means, while the lower end of the chamber are opened, and those at the upper end are closed, the water in the chamber will sink to the lower level of the canal; and on the contrary, when the lower gates are closed and the upper gates are opened, the level of the water in the lock will coincide with the level of the water in the upper part of the canal. In the first case, a boat may be floated into the lock from the lower part of the canal, and if then the gates be closed and water is admitted into the lock from the upper level, until the surface of the lock is in a line with the water in the

canal, all the water must accordingly be in a manner as still

boat will be floated up, and on the opening of the upper gates may be passed on. By reversing the course of proceeding, boats may be similarly conveyed from the upper to the lower level. When these operations are repeated, a quantity of water equal to the whole contents of the lock will have been lost from the upper level. It is a common contrivance to economize as much as possible, the water in lockage, and with this view, the size of the lock must be greater than is required for the accommodation of the boats in the canal. Still further, to secure this necessary economy, where the width of the canal will admit it, the lock is made in two compartments, communicating with each other by a valve or gate, which can be opened at pleasure. By this means one-half of the water which would otherwise be necessary to discharge to the lower level may be transferred to the other compartment. This arrangement also saves time.

In carrying a canal through an undulating country, it is necessary to have recourse to deep cutting in some parts, and to form embankments in others. In such cases the soil which is dug out in one place should be used in another, with the least possible degree of labour in conveying it; attention to this matter is necessary, in order to avoid, on the one hand, leaving spoil-banks or heaps to occupy the ground wastefully, and on the other hand, to obviate the necessity of making pits, which would be equally unprofitable.

It is necessary to construct, throughout the whole extent of the canal, a towing-path on one of the banks, which is generally made somewhat wider at the top than the other bank.

Experiments have been made with the view of determining the merits of canal carriage when compared with roads and with common roads. The results of these experiments, which are given in the following table, seem to show that at slow velocities the traffic of given weights is conducted more economically upon a canal than by the other methods of conveyance; that where the velocity exceeds four miles per hour, the economy turns in favour of roads; and that at high velocities the economy disappears even when compared with the quired on a level turnpike-road:—

Velocity of motion in Miles per Hour.	Weights moved by the application of equal ft On a Canal
2½	55,500
3	38,542
3½	28,316
4	21,680
5	13,675
6	9,635 ...
7	7,080 ...
8	5,420 ...
9	4,282 ...
10	3,468 ...
12½	1,900 ...

More recent experiments made upon the Ardrossan Paisley Canal seem to indicate the superior economy of propelling boats properly constructed at high rates of velocity through the canal; but the results thus obtained have not perhaps been yet sufficiently tested to warrant a perfect reliance being placed upon them.

A canal can seldom be cut without the proprietors having previously obtained the sanction of Parliament, accompanied by authority to take at a proper valuation the land and premises as may occur in the line which it is intended to occupy. These acts make provision for compensating such parties as may be injured or interfered with by the canal, and in general (at least in recent acts) the proprietors are restrained from levying beyond a fixed amount toll upon goods. It has been proposed in the present session (1836) to provide that at certain intervals of time these rates shall be subject to revision by Parliament, in order to protect the public more effectually against a monopoly, which every such mode of transit, when successful is liable to become, and which in the present are.

The following table exhibits, as nearly as the existing materials render possible, a list of the canals now in use in different parts of the United Kingdom, their length, the difference between the highest and lowest levels, the number of locks and gates when made at the extreme points between which they run. Some very short cuts are omitted.

CANALES

NAME.	Counties through which they are made.	Length, in Miles.	Surface breadth, in Feet.	Depth, in Feet.	Distance, in Miles, to nearest sea-port.	Number of Locks.	Proposed.	Finished.	REMARKS.
Alford (protected)	Lincolnshire	64	40	793			Connected with the Glamorgan Canal, at a short distance from the watershed of the latter, the canal is about 1 of a mile from Alford, where there is a railroad, 2 miles long, to the furnaces.
Andover	Hampshire					789			To commence 1 mile S. of Alford, and terminate in the German Ocean by a sea-lock.
de-la-Zouch	Leicestershire and Warwickshire								It commences near Andover, and terminates at Redbridge, where it enters the tideway of Southampton water.
Ashby and Loughborough	Leicestershire	(64 1/8)			162 1/2	793	1805		Commences in the parish of Ashby-de-la-Zouch, and terminates in the Coventry Canal, at Marston Bridge.
	Yorkshire					91			This canal connects the towns of Manchester and Ashton; near the latter it joins the Huddersfield Canal, thence the branches terminating near Oldham and Stockport.
	Hampshire and Surrey					29	793	796	om the Calder, 1/2 of a mile above Beld Bridge, to Barby Bridge, in parish of Cawthorne.
Bayle	Sussex	31							Commences at Basingstoke, and terminates in the Wey, 1 1/2 miles S. of the village of Weybridge.
	Warwickshire and Staffordshire	42 1/2				769			This canal begins at Blybridge, and terminates at Binesbridge, where it is a continuation of the Avon communication.
Birmingham and Fazeley (Walsall branch)	Warwickshire and Staffordshire	20 1/2							Commences near Birmingham, and terminates in the Staffordshire Canal, 1 1/2 miles from the latter.
	Staffordshire, Shropshire, and Cheshire					27			Commences at the eastern end of the Old Birmingham Canal, and terminates at the Wyrley and Essington Canal, near Whittington: it communicates with the Coventry Canal, near Fazeley.
						10	771		Commences in the Staffordshire and Worcestershire Canal, near Tettenhall, and terminates in the Chester Canal, at Acton.
Brecknock and Abercromby	Brecknockshire and Monmouthshire								Commences at Bradford, and terminates in the Leeds and Liverpool Canal, near Shipley.
Bridgewater (The Duke of Devon)	Lancashire and Cheshire	39 1/2			82 1/2	10	772	776	Commences in the Mersey and Irwell Canal, 1 mile S. of Bolton, and terminates at Bridge, near which place it communicates with the Mersey railway.
Bridgewater and Tarrant	Somersetshire	12 1/2			35				This canal commences at Minehead, and terminates at Tarrant.
Britton	Glamorganshire								above Bridgewater, and terminates at the town of Britton, near which place it communicates with the Mersey railway.
Bude Harbour and Canal	Cornwall and Devonshire					1819			Another canal, commencing in this, and joining the Bude Harbour.
	Lincolnshire								Commences in the town of North Walsham, near the Bure.
	Cumberland				70	819			Commences on the New Navigation, near Cragg, and terminates at Moorhead.
	Nottinghamshire, Yorkshire, and Derbyshire				65	776			Commences at near Bowdham, and terminates in the town of Stockwith, and terminates in the field.
		19				790			Commences at Cooch's Hill, and terminates in the Severn.
	Derbyshire and Yorkshire	9 1/2				14	1788	1790	Commences at Coventry, and terminates at Fradley Heath, in the Trent and Mersey Canal.
	Derbyshire and Yorkshire	9 1/2				98	1801		Commences in the Stowash, and terminates at its junction with the North.
	Derbyshire and Yorkshire	9 1/2				30	1793	1804	Commences in the Grand Junction Canal, near Deptford, and terminates at Deptford.
	Derbyshire and Yorkshire	9 1/2				12 1/2	1794		Commences in the Dun Navigation, and terminates at the Barnsley Canal, near Barnsley.
	Derbyshire and Yorkshire	9 1/2				12 1/2	1794		Commences in the town of Little Eaton, where it terminates; one branch goes from Derby to the Great Ool Canal on the E.; there are likewise several branches to different collieries.
	Derbyshire and Yorkshire	9 1/2				12 1/2	1794		Commences at Dretwich, and terminates in the Severn, at its junction with the Shilp.
	Derbyshire and Yorkshire	9 1/2				12 1/2	1794		Commences in the Worcester and Birmingham Canal, near Bolly Oak, and terminates with the Birmingham Canal near Tipton, from which it proceeds to

CANALS.	Counties through which they are made.	th. in Miles.	Difference of level in feet.	Number of Locks.	Date.	
	Cheshire, Denbighshire, and Shropshire	61	292		777	Commences in the tideway of the Mersey, at Runcorn Port, and terminates in the Montgomery Canal. It has also several collateral branches.
	Derbyshire & Nottinghamshire	111 44	109 131	13 13	777	Commences at the Sluice for Langley Bridge, and terminates at Trent, opposite the Sluice.
	Glamorganshire	25	611		90 794	Commences at Merthyr Tydfil, and ends in the tideway of the Taff, near its entrance into Penarth Harbour.
	Somersetshire	134		2, one of which is a tide-lock.	897	The Brue is made navigable to High Bridge, a distance of nearly a mile. Thence a canal is made to Glastonbury.
Gloucester and Berkeley (Ship)	Gloucestershire	164	level		797	Commences from the Severn, about 3 miles N of Berkeley, and terminates at Gloucester, in a spacious basin, out of which there is a lock into the Severn.
Grand Junction		43	R. 190 F. 166	98	1792 801	
Branches:—						
Paddington	Northamptonshire,	134		1	..	Begins at Braunston, where it unites with the Oxford Canal, and ends in the Thames, near Brentford.
Windover	Buckinghamshire,	64		16	..	
Fleabury	Hertfordshire, and	6	95		..	
Northampton	Middlesex,	5	112		..	
Buckingham		10	13		..	
	Surrey				807	Commences on the S. bank of the Thames, at Leatherhith, and terminates at Addington Square, Camberwell Road.
Grand Union	Leicestershire and Northamptonshire	45	R. 51 F. 70	17	810 1814	Unites with the Leicester Union Canal, about 4 miles from Market Harborough, and terminates in the Grand Junction Canal, at Long Buckby.
Grantham	Nottinghamshire, Leicestershire, and Lincolnshire	30	147		1743	Begins at Grantham, and ends in the Trent, at Nottingham. It has a branch to Bingham.
Gresley	Staffordshire		1777	From Apedale to Newcastle-under-Lyne.
Hampstead and Gloucester	Hertfordshire and Gloucestershire	16	1954		1793 1798	Commences in the Severn, at Gloucester, and is continued to Leamington.
Horncliffe	Lincolnshire	11	level		1792	From the Old Witham, near Tattershall, to Horncliffe.
Huddersfield	Yorkshire and Cheshire	194	R. 334 F. 486	133 142	1794	Begins at Huddersfield, and ends in the Ashton-under-Lyne Canal, near Bingley field Bridge.
Leicester and Langport	Somersetshire	7			1798	Commences in the Trent, below Langport, and terminates at Litchester.
Kenilworth and Avon	Wiltshire and Berkshire	57	44 5 to 6 R. 210 F. 404	132 148	1796 1810	Begins at Newbury and terminates in the Avon, about a mile from Bath. It communicates with the Wilts and Berks Canal, at Semington.
Kidguly	Caermarthenshire	..			1766	From Kidguly to Pwll Llyd, and, communicating with this last, to Pembrey. There are also tram-roads to mines in the neighbourhood.
Leeds and Liverpool	Westmoreland & Lancashire	76	R. 222 F. 66		1798	Commences near Kirby-Endon, and passes through Lancaster to Preston, where the canal is interrupted for about 4 1/2 miles, but it is connected by a railway to its continuation, which proceeds S. to Wigan: near this place it joins the Leeds and Liverpool Canal.
Leeds and Liverpool	Yorkshire & Lancashire	127	42 R. 413 F. 434	56	181	Commences at Leeds Bridge, where it unites with the Aire and Calder navigation, and terminates at Liverpool, after a circuitous course, passing by Bingley, Skipton, Calver, Blackburn, and Wigan. A branch commences 1/2 mile from Wigan, and joins, at Leigh, that branch of the Duke of Bridgewater's Canal which extends from Manchester to Leigh.
Leigh branch		7				Begins at West Bridge, in the town of Leigh, and communicates with the South River, which is made navigable (partly by cuts) to Loughborough; it terminates in the Grand Union Canal, near Gunley Hall. A branch to Market Harborough was made in 1805.
Leicester & Northamptonshire Union	Leicestershire & Northamptonshire	17 4			79 1800	Commences at Kingston, passes by Leominster, and terminates between 8 and 9 miles from Stoughton. Short lines of railway extend from the present termination to the collieries in the neighbourhood.
Leominster	Hertfordshire & Worcester	37	R. 486 F. 48		1796	From Leven to the River Navigation.
Leven	Yorkshire	3			180 180	From Tarras Pill to Liskear.
Liskear and Looe	Cornwall	54	156	25	1825	From the Hambar, near Tilly Haven, to Looe.
	Lincolnshire	14	66	..	1763	To commence at the town of Bishop's Stortford, in the canal there, and terminate in the Cam, at Glaythie Sluice: there is to be a branch to Whaddon.
London and Cambridge (projected)	Essex and Cambridgeshire	45 44	163	52	181	From the Port of Forst Canal to the Trent and Mersey Canal.
Macclesfield	Cheshire	29 4	1134	13	1826	Commences at Macclesfield, in the Mersey and Irwell Navigation, and terminates at Bolton: there is a branch to Bage.
Manchester, Bolton, and Bury	Lancashire	15	189	18	1791	Begins at Market Weighton, and ends in the Humber, opposite the mouth of the Trent.
Market Weighton	Yorkshire	11	nearly level	..	1773	Commences in the Usk River, a short distance from Newport, and terminates near Pontnewydd, where it joins the Abercrombie and Treacknock Canal. Several branches and railroads are made from this canal, to various ironworks and mines.
Monmouthshire	Monmouthshire	17 1/2	447		1792	

CANALS.	Counties through which they are made.	Length, in Miles.	Depth, in Feet.	Width, in Feet.	REMARKS.	
Manchester and Birmingham	Cheshire, Lancashire, and Derbyshire	27	295	15	Unites with a branch of the Ellesmere Canal, in Llanbthelwell parish, and terminates in the Severn at Newnham.	
Great Ouse Navigation	Glamorganshire	14			1798 Begins near Aberystwyth, and terminates at the town of Llanbthelwell.	
Marston Canal	Buckinghamshire	14	504		Commences at Marston, and terminates at Banbury.	
North Walsham and Dilham	Northfolk				1811 Commences at Waynflete, in the parish of the Ant, and terminates at Antingham.	
North Wilts	Wiltshire		57		From the Wilts and Berks Canal, near Swindon, to the Thames and Severn Canal, near Weymouth Bridge.	
Nottingham Branch	Nottinghamshire	14	123		1802 Commences at the Cromford Canal, and terminates in the Trent, near Nottingham.	
Oakham	Leicestershire & Rutlandshire		126	17	1793 1803 Commences at Oakham, and terminates in the Melton Mowbray Navigation, at Melt.	
Oxford	Oxfordshire and Warwickshire	28	6 to 4 1/2	R. 71.5 F. 195	43 769 1790 Commences in the Coventry Canal, at Longford, and terminates in the Thames, at Oxford.	
Peak Forest	Derbyshire & Cheshire	14 1/2			1794 1800 Begins at the town of Ashton under Lyne, in the Manchester Canal, and terminates in Peak Forest.	
Pecklington	Yorkshire	8 1/2			Commences in the Derwent, at East Cottingham, and terminates at Pecklington.	
Portsmouth and Arundel (main line)	Sussex and Hampshire	11 1/2	33	4 1/2 to 8	Commences from the tideway of the Arun, 3 miles from the sea, and continues to Chichester Harbour. The channels from the end of this main line, through Thorny Island, and to the end of the Portsmouth Canal, are 13 1/2 miles.	
Portsmouth branch		9 1/2		10		
Chichester branch		1 1/2				
Regent's	Middlesex	8 1/2			818 Begins in the Paddington Canal, near the Harrow Road, and locks into the Thames, at Limehouse.	
Ribble	Yorkshire & Lancashire	31 1/2	R. 5334 F. 3534	78	Commences in the Calder Navigation, at Sowerby Bridge Wharf, and terminates in the Duke of Bridgewater's Canal, at Manchester.	
Royal Military	Kent and Sussex	30	3 to 72	level.	From Shoreham in Kent to Chichester in Sussex.	
St. Colombe	Cornwall	6			From Mangan's Porth to St. Colombe's Porth.	
Salisbury and Southampton	Hampshire				Commences at Southampton, and is continued at present only to Redbridge, where it joins the Andover Canal.	
Sandwich	Lancashire	12	5 1/2	78	8 and 2 double	765 1768 Commences at St. Helens, and terminates in the Mersey, by a very circuitous route, passing Sandwich Bridge. It was the first canal executed in England, and originally ended at the mouth of Sandwich Brook. It is now extended to Warrington.
Sheffield	Yorkshire		70	11	816 ..	Connects the town of Sheffield with the river Don.
Shrewsbury	Shropshire		R. 154 F. 207	partly locks, partly inclined planes, 3 in closed planes.	793	Commences at Shrewsbury, near the Ellesmere Canal, and joins the Donnington and Shropshire Canals at Rockwardine Wood.
Shropshire	Shropshire		R. 333 F. 207		1788 792	Begins in the Donnington Canal, in the parish of Lillishall, and unites to the Severn at Coala Port, below Coalbrook Dale.
Somersetshire Coal	Somersetshire		130	23	1794	Commences in the Kennet and Avon Canal, near Bradford, to Paulham, and way branches off to collieries at Wotton and Glandon.
Staffordshire and Worcester	Staffordshire and Worcester	46 1/2	R. 274 F. 1004	44	1766 772	Commences in the river Severn, at Stourport, and unites with the Trent and Mersey Canal, near Haywood.
Stainforth and Keadby	Yorkshire & Lincolnshire	15	nearly level.	2	1793	Commences at the Don Navigation, near Stainforth, and communicates with the Trent, at Keadby.
Stroudwater	Gloucestershire		102 1/2		1730	Commences at the Severn, near Frampton, and terminates in the Thames and Severn Canal, at Wallbridge, near Stroud.
Stourbridge	Staffordshire and Worcester	28	191 1/2		776	Begins near Stourbridge, and joins the Staffordshire and Worcester Canals, near Stourton.
Stratford-upon-Avon	Warwickshire & Worcester	23 1/2	309		1735	Commences at King's Norton, about 6 miles from Birmingham, where it joins the Worcester and Birmingham Canal, and terminates at Stratford.
Swansea	Gloucestershire & Glamorganshire	17	37 1/2		1794 1798	Commences in Swansea Harbour, and terminates at Pen Tawe.
Tavistock	Devonshire	4 1/2	256		1802 181	Begins in the tideway of the Tamar, and terminates at the town of Tavistock; there is also a branch.
Thames and Medway	Kent	7 1/2	level.		1804	From the Thames, at Gravesend, to the Medway, near Rochester.
Thames and Severn	Gloucestershire and Wiltshire	30	R. 243 F. 184	28 14	1783 1789	Commences in the Stroudwater Canal, near Stroud, and locks down in the Thames and Isis Navigation, at Lechlade.
Trent and Mersey, or Grand Trunk	Cheshire, Staffordshire, & Derbyshire	99	R. 326 F. 324	91	1765 1777	Begins where the Derwent falls into the Trent, and terminates at Preston Brook, where it communicates with the Duke of Bridgewater's Canal; in its course it communicates with other principal canals also.

* St. Colombe's Canal, though of short extent, is found very useful for the exporting of minerals, and conveying sand and other manure to the adjoining lands. (Priestley's *Historical Account of Canals*, p. 623.)

CANALS.	Counties through which they are made.	Length, in Miles.			Difference in level at various points.	Number of Locks.	Date.		REMARKS.
							Projected.	Finished.	
Ulverston	Lancashire	11	63	15	level.	sea lock.	1793	..	Commenced in Morecambe Bay, on the Irish Sea, and terminates at Ulverston.
Warwick & Birmingham	Warwickshire	22½			{ R. 183 F. 42 }	{ 27 5 }	1793	1799	Commenced in the borough of Warwick, and joins the Dugby branch of the Birmingham Canal, at Birmingham.
Warwick and Napton	Warwickshire	14			132½		1794	1799	Commenced at the Warwick and Birmingham Canal, in the parish of Bedbrook, and joins the Oxford Canal, near Napton.
Wey and Arun	Surrey and Sussex . .	18			..	23	1813	..	Begins in the Wey, between Guildford and Godalming, and ends in the Arun Navigation, at New Bridge.
Windsor and Berks	Wiltshire and Berkshire	52½	27½		{ R. 170 P. 205 }	41	1801	..	Commenced in the Thames, at Abingdon, and terminates at Reading, in the Kennet and Avon Canal; it likewise has several branches.
Wisbech	Cambridge	6			level.	{ 2 flood-locks }	1794	..	Commenced in the Nene River, at Wisbech, and terminates in the Old River, at Antwell.
Worcester and Birmingham	Worcestershire	29	42		428	71	1798	..	Commenced in the junction of the Birmingham and Birmingham and Fosseway Canals, at Birmingham, and ends in the Severn, a little below Worcester; it also communicates with the Dudley and Stratford-upon-Avon Canals.
Wyrley and Essington	Staffordshire	24	28	4½	306	36	1799	..	Commenced with the Coventry Canal, near Walsall, and terminates in the Birmingham Canal; it has likewise several branches.

CANALS OF SCOTLAND.

CANALS.	Counties through which they are made.	Miles.		Difference in level at various points.	Number of Locks.	Date.		REMARKS.
Aberdeen	Aberdeenshire	19	23	168	17	1796	1805	is in the harbour of Aberdeen, in the tide-way of the mouth of the Dee, and ends in the Don, at Strathmore.
Borrowstouness	{ Linlithgowshire and Stirlingshire			level.		1768		From the harbour at Borrowstouness, to the Forth and Clyde Canal, at Grange-mouth.
Caithness	Inverness-shire	60½	120	Summit level, Loch Oich, 91 feet above sea-level.	28	1803	1822	Commenced in the tide-way of Loch Eil, at the N. end of the Loch, and terminates in the Muir of Frith, at Foverness. Of the whole line, rather more than 23 miles are artificially formed; the remaining line is formed by natural lakes, which are connected by means of this canal.
Cannock	Argyleshire	9½		{ R. 53 F. 55 }	15	1793		Made across an isthmus in Argyleshire, lying between Loch Crinan and Gilly, and connecting them.
Edinburgh and Glasgow Union	{ Stirlingshire, Linlithgowshire, and Edinburghshire			110	11	1817		Commenced in the sixteenth lock of the Forth and Clyde Navigation, about 2 miles W. of Falkirk, and terminates in a basin at Edinburgh.
Forth and Clyde	Dumfriesshire, Lanarkshire, and Stirlingshire	35		{ R. 155 F. 156 }	39	1768	1790	Commenced in the Forth, in Grange-mouth Harbour, and locks down into the Clyde, at Bowling's Bay, near Dalmuir Burnfoot; this canal opens a communication between the Irish Sea and German Ocean.
Glasgow, Paisley, and Ardrossan	Ayr, Renfrew, and Lanarkshire			level.		1806		Commenced at Tradestown, on the W. side of Glasgow, passes through Paisley and terminates at Johnstone; here a railway joins it, which is continued to the harbour of Ardrossan; the railway is 32½ miles long.
Glenkonns	Kirkcudbrightshire	25½			15	1808		Commenced in the tide-way of the Dee, near Kirkcudbright, and is continued to Loch Ken, through which the navigation is continued for 12 miles; thence another canal extends to the Hop, Pool at Dalry, where it terminates.
Glenkiln	Lanarkshire	12		183½	10	1770		Begins at Old Monkland Coal-works, and proceeds to Glasgow, where it communicates with a branch of the Forth and Clyde Canal.

CANALS OF IRELAND.

	Counties through which they are made.	Length, in English Miles.	Surface Depth, in Feet.	Depth, in Feet.	Difference of Elevation, in Feet.	Number of Locks.	Projected.	Finished.	
Grand Canal	Dublin, Wick, King's County, and Galway.	{ 87 14 }	40	6	278	{ 39 and 5 double }	1756	..	Commenced at Dublin, near the mouth of the Liffey, and crosses the Shannon near Banagher, terminating at Mullingar; there are also several branches.
Royal Canal	Dublin, Meath, Westmeath, and Longford.	83	44	6	322	42	1789	..	Commenced at Dublin, and terminates in the Shannon at Tarmunbarney.
Newry	Down and Armagh	19	30	5	65	13	1709	..	The navigation commences near the midway at Rathfriland, 24 miles to Newry, having a sea-lock at each end, and is 17 feet deep; from Newry the Canal continues for 13 miles to the navigable river Bann, which, after a course of 9 miles from this point, runs into Lough Neagh, which is navigable 13 miles long and 6 broad, and which also communicates with Belfast by the Lagan Navigation; with the Tyrone collieries by the Blackwater, and with the town of Antrim by the Antrim.
Lagan Navigation		13	1729	..	The Lagan navigation extends from the midway at Belfast into Lough Neagh.
Tyrone Colliery		6	8	1738	..	From Coal Island to the Blackwater for 3 miles, and thence by a short cut into Lough Neagh.
Ulster (now in progress)	Armagh, Monaghan, and Fermanagh.	46	1832	..	Commenced near Charlemont, on the Blackwater, and terminates in Lough Neagh.

Besides the canals noticed in the foregoing tables, there are many rivers, which have been made navigable by short cuts at different parts; others have had their channels turned, or canals made parallel to them, and several have been extended by branch cuts. These may almost be considered as canals, but a notice of them could not be given in the tables without increasing their length considerably.

(Nichols, Priestley, and Walker's *Historical Account of the Navigable Rivers, Canals, &c., of Great Britain*; *Parliamentary Reports on the Caledonian Canal, and on Improvements in Ireland*; C. W. Williams's *Observations on the Inland Navigation of Ireland*; Tatham's *Political Economy of Inland Navigation*; Phillips's *General History of Inland Navigation*.)

CANAL ANTONIO, called Canaletto, was the son of Bernardo Canal, who, although descended from one of the noble families of Venice, followed the profession of a scenopainter. Antonio was born at Venice, but the precise date of his birth appears to be unknown; at his death, in 1768, he was aged 71. He originally followed his father's occupation; and the style of his early practice may be traced in the boldness and vigour of his later works, and the deceptive reality of the effect. About the year 1719, disgusted with the petty annoyances of the theatre, he abandoned it altogether, and went to Rome, where he employed himself for a long time in studying from the ancient ruins. On his return home, he devoted himself to painting views in the city, and original compositions. In the latter part of his life he resided in London, where he was in great estimation. Walpole imagined that one object of his coming was to invest part of the wealth he had acquired in the English funds.

His handling is light, bold, and firm; his colouring bright, true, and refreshing; his figures well disposed. He has displayed no less art in his choice of subjects and sites, and disposal of all the separate parts, than in the treatment and execution. He sometimes used the camera, which enabled him to attain the utmost exactness in his linear perspective, but he used it discreetly, always correcting and improving the tints and aerial effects. In his pictures, the palaces of the Adriatic are brought before the eye with all the vivid beauty of the actual scene; and his original compositions, in which the ancient and the modern are most happily blended, partake of the reality of his views. His works are very numerous, and are seen in every collection.

His pupil Guardi is the most eminent of his followers. He paints in a style which is brilliant and agreeable, but less solid and less exact than his master's. (Zanetti.)

CANALIRA, (Исапона.)

CANARA, a province on the west coast of Hindustan between 12° and 15° N. lat., and between 74° and 76° E.

long. This province is bounded on the N. by Bejapore and the Portuguese territory; on the E. by Mysore and the Balaghaut ceded districts; on the S. by the Malabar province, and on the W. by the Indian Ocean. The length of the province along the coast from N. to S. is 100 miles, and its mean breadth is about 40 miles; the total area has been computed at 7380 square miles; of this area 4622 square miles are contained below and 2758 square miles above the Ghauts [GHANTS.]

The province is divided into two districts, North and South Canara; the line of division is about 13° 40' N. lat. The surface of Canara is rocky and uneven. On the high grounds red gravel prevails; near the coast the soil is sandy, but the valleys are well adapted for rice cultivation. There are several mountain streams in the province, but no rivers of consequence. The labour required to bring the land into cultivation is great, owing to the inequalities of the surface, which make it necessary to level the fields before they can be ploughed. If after the land has been brought under tillage it should be neglected for one or two years, it will be broken by numerous deep furrows formed by the torrents which fall during the monsoon. It is probably owing to the constant attention thus rendered necessary that each proprietor is obliged to reside upon his farm, and that the extent of the individual farms is very small. For the same reason the revenue derived by the government from the holders of the land is very inconsiderable.

The entire population of Canara in 1807 was 576,840 souls, of whom 396,672 inhabited the southern district. The proportion of Brahmins was computed at rather more than one-sixth of the whole population. About three-fourths of the remainder are engaged in cultivating the soil: one-fifth of these cultivators are slaves. The inhabitants of the sea-coast are principally Mohammedans, and those of the interior Jains, one of the Hindu sects that are considered heretical by the Brahmins.

Almost the only production of the province is rice, for cultivating which the climate is peculiarly favourable, owing to the prevalence of rains. Land of the first quality yields two and sometimes three harvests of rice in the year. Inferior lands yield one crop of rice and another of some inferior grain annually. Cocoa-nuts, betel, and pepper are cultivated, but not extensively. The rent of land varies between one-fourth and one-half of the gross produce: it very rarely happens that the proprietor alters the assessment of a farm or removes the tenant, who is considered by custom to have a kind of right to the occupancy. Out of the rent paid by the tenant to the proprietors the latter contributes 60 per cent. to the revenue of the government, which thus receives from 15 to 30 per cent. of the gross

produce of the land. When a farm is sold it usually brings as purchase money from eight to twelve years' net rent, the price varying according to the proximity of towns.

The chief towns are, in the north division Batticollah, and in the south division Mangalore and Barcelore. Batticollah stands on the sea-coast in $13^{\circ} 55' N.$ lat., and $74^{\circ} 37' E.$ long.; it is situated on the north bank of the Scandaholay, a small stream which waters a beautiful valley surrounded by hills. Mangalore is built on the margin of a salt lake, which is separated from the sea by a sandy beach in $12^{\circ} 53' N.$ lat., and $74^{\circ} 57' E.$ long. Mangalore is a place of considerable trade; the exports consist principally of rice, betel-nut, pepper, sandal-wood, and turmeric, to Muscat, Goa, Bombay, and the coast of Malabar. The imports consist of raw sugar and silk from Bengal and China, and of oil and ghee from Surat. The Portuguese had a factory at Mangalore, which was destroyed in 1596 by the Arabs from Muscat. In 1768 the town was taken by the English, but was immediately retaken by Hyder. In 1783 it again surrendered to the English, and was immediately thereafter besieged by Tippon, and when at the conclusion of the war it was given up to that chief was little more than a heap of ruins. The fortifications have since been entirely dismantled. The population is estimated at 30,000 souls. Barcelore, supposed to be the Barace of the ancients, is situated on the sea-coast 35 miles N. from Mangalore, in $13^{\circ} 37' N.$ lat., and $74^{\circ} 47' E.$ long.

The province of Canara, which till then had been subject to Hindu sway, was subdued by Hyder Ali, rajah of Mysore in 1763. On the death of his son Tippon, in 1783, the whole province was placed under British authority, and has since remained in our possession, and in the enjoyment of uninterrupted tranquillity. The wars that had disturbed the province between its conquest by Hyder and its possession by the English had much reduced the population, and a considerable part of the country had been suffered to run waste and was overgrown with jungle. Since that time a great improvement has taken place in the numbers and condition of the people, which is shown by the better quality of their dress and greater attention to other comforts, as well as by a decrease in the number and atrocity of the crimes committed by them.

(Buchanan's *Journey through Mysore, Canara, and Malabar*; Mill's *History of British India*; *Reports of Committees of House of Commons on the affairs of India*.)

CANARIES, a group of islands in the North Atlantic Ocean, lying off the coast of Africa, between the parallels of $27^{\circ} 40'$ and $29^{\circ} 30' N.$ lat. and the meridians of $13^{\circ} 30'$ and $18^{\circ} 20' W.$ long. Lanzarote is the most eastern island of the group, and Ferro, from which the meridians used to be generally reckoned, is the most westerly.

These islands are by some supposed to be the Fortunate Islands of the ancients; but others consider this name to refer to Madeira. Perhaps the Canaries however have the better claim, if we follow the description in Pliny (vi. 32), which is taken from Juba, the learned Mauritanian prince. Juba calls one island Nivaria, or Snow Island, which is probably Tenerife; another island he calls Canaria, from the number of dogs of a large size that were found there; Juba had two of those dogs. It is probable that the Goths and Vandals who invaded the coasts of Mauritania may have been acquainted with this group; but the first account we have of them in modern times is about the year 1330, by a French ship which was driven among them by stress of weather. Upon this discovery a Spanish nobleman, Don Luis, Count of Claromonte, obtained a grant of the islands from Pope Clement VI., with the title of king. Nothing was however done towards making a settlement till 1385, when a fleet under Ferdinando Perara sailed from Cadiz and touched at Lanzarote, but was driven away by the natives. The next expedition was from Seville, in 1393, but no possession was taken of any of the islands. In 1400 another fleet sailed from Rochelle, under John de Bethencourt, and anchored at Lanzarote, where they built a fort at Point Rubicon. The adventurers then passed over to Fuertaventura; but being opposed by the natives they were obliged to re-embark. Bethencourt returned to Spain, and having obtained from Don Henry III. a grant of the islands, with the title of king, again sailed to Lanzarote with a large armament, and in June, 1405, passed over to Fuertaventura, of which he took possession. He next sailed to Grand Canary and Palma, from both of which he was driven by the natives. He was more fortunate at Gomera, where, to his

surprise, he found several of the natives speaking Spanish. To account for this, it appears that about thirty years previously some Spanish vessels had touched at this island, and had left a priest there to convert the natives to the Romish faith. No written account of this visit exists.

Bethencourt next went to Ferro, or Hierro, where he was received in the most friendly terms by the natives; he left a garrison in the island, and returned to Fuertaventura. In November, 1406, he mustered all his forces to make another attempt on the Grand Canary, in which he was again unsuccessful, and in consequence returned to Spain to solicit assistance, but he died in 1408. The nephew of Bethencourt, in 1418, sold his right to these islands to Henry de Guzman, another Spanish nobleman, who expended large sums in endeavouring to subdue the other islands. He altogether failed in his schemes, though in 1461 the Spaniards went through the form of taking possession of Canary and Tenerife.

Some difference having arisen between Spain and Portugal with regard to these islands, in consequence of a second sale of them by the nephew of Bethencourt to the latter power, the Portuguese arrived in force at Lanzarote to take possession; but the dispute was settled by treaty, in which the islands were ceded to Spain. After various other fruitless attempts to subdue the Grand Canary, a treaty of commerce was entered into with the chiefs of that island in 1476; but in the same year the court of Castille purchased the right to the three unconquered islands of Canary, Tenerife, and Palma, and in the following year sent out a fleet to undertake the conquest of Canary, which however was not finally accomplished till April, 1483, seventy-seven years after the first descent on the island by John de Bethencourt.

In 1490 a fleet was equipped for the subjugation of Palma and Tenerife, and arrived at Palma in September; Palma was taken about May following. The fleet then sailed for Tenerife, in May, 1493, when this large island was reduced without bloodshed. Since this time the Canaries have always belonged to the Spanish crown, though several descents have at different times been made upon them, which have generally proved unsuccessful. Those nearest the African shores have been ravaged by Barbary corsairs.

This group consists of the following large islands:—Canary, Tenerife, Palma, Ferro, Gomera, Fuertaventura, and Lanzarote. There are also some smaller islands, as Santa Clara, Alegria, and Graciosa. The coasts of the islands are high and precipitous, but here and there broken by deep clefts. The mountains generally rise towards the centre of the islands, bleak and bare, and are full of pointed rocks. During the winter there is snow on several of the highest summits. The Peak of Tenerife, a half-extinct volcano, rises to the height of about 11,400 feet, and as it is viewed from the sea at a distance, seems to spring out of the water like a sugar-loaf. They are all of volcanic formation, and in parts exceedingly fertile; they produce grain and fruits, both tropical and European, in abundance. A volcano burst out in 1824 in the island of Lanzarote. The vine is largely cultivated, and in most of the islands wine is made, which is well-known in Europe under the name of 'Teneriffe,' that island being the principal seat of the wine trade. Sugar is also made, and there are manufactures of coarse linens, cloths, and silks. An active trade is kept up among the islands, and they have large fisheries on the African coast. There are no close harbours, the anchorage being generally open roadsteads, few of which can be considered safe except during the fine season. The depth of water between the islands is very great, and the passages are good. Supplies of provisions, &c., may be obtained from any of them, though some of the islands are without water, and depend on rain, which they keep in tanks. All kinds of domestic cattle abound, though only goats and sheep were found there. Camels have been introduced, but do not thrive well. Each island has its governor; but the whole group is under a governor-general, who commonly resides at Tenerife, though all the law courts are held at Canary. Being situated within the general limits of the trade-wind, these islands enjoy a fine climate, and are very healthy: in summer there is a land breeze off them at night. The S.W. winds, though rare, blow strong and bring rain, while the S.E. wind is dry and hot, like the sirocco of the Mediterranean. The inhabitants may now be considered as Spaniards, though after their conquest they did not endeavour to extirpate the aborigines, who were called Guanches,

but intermarried freely with them after their conversion to the Romish faith. Owing to this intermixture, the Guanches have now ceased to exist as a separate people. Mummies of the aborigines, wrapped in goat-skins, have been found in caves in the mountains. At the time of Bethencourt's visit, the group was not under one government, but most of the islands were divided into one or more portions, governed by independent chiefs, and the boundaries were marked off by walls of loose stones. The inhabitants consequently differed considerably in manners and customs. Their clothing was goat-skins, and their weapons were slings, darts, spears, and clubs. They believed in one God, and polygamy was not allowed; they were social and cheerful, and fond of music. The present inhabitants are bigoted Catholics; the whole group forms a bishop's see, who is a suffragan of the Archbishop of Seville.

Comparative statement of the population of the Canary Islands from the year 1742 to 1835.

ISLANDS.	1742.	1768.	1802.	1835.	Increase in the 93 years.	Centen- simal increase.

The importations and exportations to and from the whole of the islands during 1833 were as under:—

	Value of Goods imported to	Value of Goods exported from
	Rials	Mara
	vellon.	vedels.
Foreign Countries	11,073,225	9
America	1,069,697	24
The Peninsula	2,614,290	24
Total	13,257,216	93

The goods imported into the islands are sugar, coffee, brandy, corn, paper, soap, oil, candles, leather, fabrics in silk, woollen, flax, and cotton; glass, earthenware, &c.

The articles exported are silk, brandy, pulse, grain, fish, barilla, wine, Orchilla weed, &c.

Three other articles for exportation are of recent introduction in the islands. These are rock-moss (*nutgo*), tunny-fish (*atun*), and cochineal: the latter, feeding on the *Cactus Opuntia*, increased greatly during the year 1833. In that year 1275 lbs. were exported to the Peninsula.

The chief towns are Las Palmas, in Canary, with a population of about 10,000; Santa Cruz, in Teneriffe, the seat of the governor, has a population of about 8500; and San Christoval de la Laguna, which stands on a high plain in the same island, has a population of near 9000; Oratava, near the foot of the high Peak, has about 7000 inhabitants. Santa Cruz is also the name of the chief town of Palma.

(Glas, *History of the Canaries*; Humboldt's *Travels*; Von Buch's *Description of the Canaries*.)

CANARIES, in music, a quick dance-tune, in three-eight time, said to have been imported from the Canary

Islands, though from Norway by de Bethencourt, who invaded them at the close of the fourteenth century. Purcell has, in his 'Dictionnaire,' introduced the *Canaries*. His tune is in two strains of eight bars each, in three-eight time.

CANARY BIRD, or CANARY FINCH—*La Serin de Canarie* of the French, *Der Canarienvogel* of the Germans, *Canario* of the Italians, the *Canary* of the English, *Fringilla Canaria* of Linnaeus*—the well-known songster which is to be found caged in every house where the inmates are fond of song-birds. The Canary Islands are the most frequented haunts of the species. In the wild state the prevailing hue, according to the observations of Adanson, Labillardiere, and others, is grey or brown, mingled however with other colours, but never reaching the brilliancy of plumage exhibited by the bird in captivity; a brilliancy arising from long domestication and repeated crosses with analogous species. Its introduction into Europe is stated by some to have taken place in the 11th century; but Bechstein names the beginning of the 16th. 'The arrival,' says the author last quoted, 'of the canary in Europe, is thus described:—A vessel which, in addition to its other merchandize, was bringing a number of these birds to Leghorn, was wrecked on the coast of Italy, opposite the island of Elba, where these little birds, having been set at liberty, took refuge. The climate being favourable they increased, and would certainly have become naturalized, had not the wish to possess them occasioned their being caught in such numbers that at last they were extirpated from their new abode. From this cause Italy was the first European country where the canary was reared. At first their education was difficult, as the proper manner of treating them was unknown; and what tended to render them scarce was, that only the male birds were brought over,—no females. The grey of its primitive colour, darker on the back and greener on the belly, has undergone so many changes from its being domesticated, from the climate, and from the union with birds analogous to it (in Italy with the citril finch, the serin; in our country (Germany) with the linnet, the green-finch, the siskin, and the goldfinch, that now we have canaries of all colours. If we had not sufficient proof that canaries came originally from the Fortunate Islands, we should think the citril finch, the serin, and the siskin, were the wild stock of the domesticated race. I have seen a bird whose parents were a siskin and serin, which perfectly resembled a variety of the canary which is called the green. I have also seen mules from a female grey canary, in which was no trace of their true parentage. The grey, the yellow, the white, the blackish, and the chestnut, are the principal

* Dr. Hemmeke (*Zoology*, 1. *Junco*, vol. v. p. 70) considers *Fringilla Canaria* and *Fringilla holoserica* as synonyms, and he there gives an elaborate description of the bird as it appears in Madeira. Of its habits Dr. Hemmeke says, that it builds in thick bushes high shrubs and trees, with roots, moss, feathers, hair, &c.; that it pairs in February, lays from four to six pale blue eggs, and hatches five times (not infrequently six) in a season. He observes that it is very familiar, haunting and breeding in gardens about the city. 'It is a delightful songster,' says the Doctor, 'with, beyond doubt, much of the nightingale's and skylark's, but none of the wood lark's song, although three or four skylarks in concert in Funchal are the only examples of any of these three birds in the island, and notwithstanding the general opinion that such notes are the result of education in the canary; it is in full song about nine months in the year. I have heard one sing on the wing, and passing from one tree to another at some distance, and am told that during the pairing season this is very common. Each flock has its own song, and, from individuals in the same garden differing considerably, I suspect that of each nest varies more or less. After the breeding season, they flock along with linnets, goldfinches, &c., and are then sold in seen in gardens. The moult takes place in August and September. An old bird caught and put into a cage with sometimes sing almost immediately, but seldom lives longer than the second year in confinement. The young from the nest are difficult to rear, dying generally at the first moult. They cross readily with the domesticated variety, and the progeny are larger, stronger, better breeders, and, to my taste, better songsters also than the latter; but a pure wild song from an island canary, at liberty, in full throat, and in a part of the country so distant from the haunts of men that it is quite unsophisticated, is unequalled, in its kind, by any thing I have ever heard in the way of bird-music.'

In the last edition of Montagu's Ornithological Dictionary (1833) it is stated that the *Fringilla Canaria* of Linnaeus, whose habitation is said by Gmelin and Turton to be India, is not this species, but an apparently spurious one. In the twelfth edition of the *Systema Naturae* the habitat assigned to *Fringilla batyraea* is 'Madera,' and that allotted to *Fringilla Canaria* is the Canary Islands, 'Habitat in Canariis Insulis.' In Gmelin's edition, India and the Cape of Good Hope are the localities given to *F. batyraea*; but the Canary Islands are still stated to be the habitat of *F. Canaria*. 'Habitat in Insulis Canariis, aliquosque maris Atlantici, in littore Africæ orientali, per omnia Europæa familiaris, longæque ægræque cantans,' &c. &c.

† Professor Rennie, in his edition of Montagu, thus writes on this part of the subject:—'The original stock is said to have been imported from the Canary Isles, about the 14th century; a circumstance not mentioned by Bechstein, and discredited by Syme, for these reasons. The wild birds found in the Canary Isles, says he, bear less resemblance in song and plumage to the domestic canary than to the siskin of Germany, the venturian of Italy, or the serin of France. The plumage of these is a mixture of yellow, green, and very little brown or grey; whilst the wild canary has a plumage of dingy greenish grey. One of these birds, which I received from St. Michael's, sang very much like the linnet.'

varieties, and it is from their combination, and from their tints, that we derive the numerous varieties that we now possess. Those canaries that have the upper part of the body of a dusky green or linnet-brown, and the under part the yellowish green of the green-bird, with dark brown eyes, are the strongest, and most nearly resemble the primitive race. The yellow and white often have red eyes, and are the most tender. The chestnut are the most uncommon, and hold a middle rank for strength and length of life, between the two extremes. But as the plumage of the intermediate ones is a mixture of these principal colours, their value depends on the pretty and regular manner in which they are marked. The canary that is most at home amongst us now is one with the body white or yellow head, particularly if crested, wings and tail, yellowish; the second in degree is of a golden yellow, with the head, wings, and tail black, or at least dusky grey. Next follow the grey or blackish, with a yellow head and collar, and the yellow with a blackish or green tuft, which are very much valued. As for those that are irregularly spotted, speckled, or variegated, they are much less sought after, and are used to pair with those of one colour, white, yellow, grey, brown-grey, and the like.'

The usual length of a canary is about five inches, of which the tail measures about two and a quarter. The bill is about five lines in length, strong, sharply pointed, and inclining to white. The shanks or feet, as they are technically called, are about eight lines long, and of a flesh-colour.

The female is very like the male, but is generally less bright in colour, smaller about the head, shorter about the neck and body, not so high on the shanks, and altogether of a form somewhat less elegant than that of the male. There is a bean-shaped feather under the bill, and the temples and circles round the eyes are deeper in colour than the other parts of the body.

HYBRIDS.

1. *Mules bred from a hen Canary and a Goldfinch*.—These partake of the parental colours on both sides. The finest are produced from yellow or white hen canaries. 'The most beautiful,' says Bechstein, 'that I have seen was greyish ash-colour in the middle of its crest, and silvery white on the rest of its head and nape; a broad orange border surrounded the beak, and the neck was adorned with a white collar; the back was a dusky grey with black streaks; the rump white, the under part of the body of a snowy whiteness; the under tail-coverts, the wings, and first quill-feathers white, but the others, as well as the coverts, black edged with yellow; the middle of the wing was also adorned with a beautiful golden-yellow spot; the white tail had a black spot on the sides, the white beak was tipped with black, the feet were white. The mother of this beautiful bird was white, with a greenish-grey crest.'

2. *Mules bred from a hen Canary and a male Siskin*.—The young always resemble the siskin in shape. If the mother be green they will be like a hen siskin; if she be white or yellow, they will be lighter in colour than a siskin, without however any great difference.

3. *Mules bred between a hen Canary and a Green-bird, or a Citril-finch*.—When the mother is neither white nor yellow the young do not differ much from the grey or green canary; but they are generally rather more slender, and their bills are also shorter and thicker.

4. *Mules bred between a hen Canary and a Linnet*.—These, if the mother be white or yellow, will be speckled; if she be grey, they will resemble her generally, but their tails will be longer.

Most of these mules are fruitful, and there is no great difficulty in getting the parents to pair; but when the union is with species more remote, the difficulty increases in proportion.

The following unions have in a certain degree succeeded.

5. *Mules between a hen Canary and a Bullfinch*.—Bechstein states that an ardent bullfinch will sometimes yield to the allurements of a very ardent hen canary, and that he has himself witnessed it, observing, however, that the eggs seldom prove fruitful. But Dr. Jassy, of Frankfort, obtained mules of a bullfinch and canary, by making other canaries sit on the eggs and bring up the young, a plan pursued in Bohemia. 'My bullfinch,' writes Dr. Jassy to Bechstein, 'is so attached to the female canary that he mourns all the time they are separated, and cannot bear any other bird.' In this union spotted or crested females

should not be chosen, because the top-knot would be very unbecoming on the large head of the mule.

6. *Mules between a hen Canary and a Nightingale*—Bechstein possessed a nightingale which, having been for a long time shut up with a female canary, lived very sociably with her, singing as usual. He paired with her in Bechstein's presence, but the eggs were unproductive, and Bechstein expresses his intention to try the plan of giving the eggs to another sitter, if the same thing should happen again.

Besides the birds above enumerated, chaffinches, yellow-hammers, &c., have been tried, but with no good success. The author has above-quoted says that he never saw a male canary very fond of a female yellowhammer, nor a male of the latter kind of a female canary, though the plumage may be dyed so as to offer a striking resemblance.

It will be observed, that in all the six instances recorded the canary is always the mother. The reason why breeders select the male of the other species when mules are desired, is because, though a female siskin, or goldfinch, &c., might not and probably would not object to the union, she could not easily be induced, if at all, to lay her eggs in an artificial nest, like a canary.

Before we conclude our notice of the hybrids, we must again refer to the alleged fruitfulness of some of the mules, such as those of serins, citril finches, and goldfinches, a very interesting subject to the physiologist, who has, in following out this point with the canary bird and her different mates, an opportunity of observing how far these hybrids have the power of continuing their mixed forms. The first eggs of these hybrids are said to be very small, and the young hatched from them very weak. The eggs of the next year are said to be larger, and the nestlings stronger and stouter.

For breeding, a male aged from two to five years is chosen by the experienced. If a young male be introduced among older females, the offspring will consist of more males than there are females. The signs of age are rough and blackish scales on the feet, and elongated strong claws. It is not common to meet with good males, and such are valuable. Many cocks are mopes, and seldom sing; and their indifference to their hens is repaid by a similar indifference to them on the part of the latter. Some are violent, beating and often killing their hens and nestlings; while others, from an excess of ardour, tease their hens while they are sitting, or tear the nest and destroy the eggs, in their vexation at the incubation abstracting the attention of their mate; these often produce at last so much excitement in the females, that the latter abandon their eggs.

Good hens are not less valuable and scarce. Some of the ardent ones lay, but will not sit; others, after hatching their nestlings, neglect to feed them, or beat them and pick out their feathers, so that the hapless young die wretchedly. To some, again, laying is so painful, that they are too much fatigued to sit, or suffer long intervals to elapse between the times of depositing each egg.

In order to obtain bright and good plumage, those birds whose colours are clear and whose spots are clean and well defined should be placed together. A brownish-grey or greenish bird paired with one of a lively yellow often produces young of a dim white, and of other admired colours. Two crested birds should never be joined, for their offspring are frequently hatched with part of the head bald, or otherwise deformed in plumage.

Bechstein gives the following directions for forwarding the breeding of canaries:—The best time for pairing canaries is the middle of April. Either one male, and one or two females, be placed in a large cage, or many of both sexes are united in a room or aviary, having the advantage of a south aspect. Nests made of turned wood, or osiers, are given them, as straw ones are too easily torn. It is a good plan to place in the room or aviary slips of pine, which being cut in February do not lose their leaves. If a little inclosure of wire-gauze can be fixed over the window, where the birds can enjoy the fresh air, nothing will more effectually contribute to render the young healthy and robust. Birds which are to be paired for the first time should be previously placed in the same cage for seven or eight days, in order to become acquainted and accustomed to live together. If two females are to be caged with one male, it is especially necessary that they should be together long enough to leave off quarrelling, and the pairing-cage should be divided into two equal parts, communicating by a sliding door. This being done, a lively male and one of the females should be placed in the first division, as soon as she has laid, the male should be moved into the other division, the door of

separation being shut; but as soon as the other has also laid, the door may be left open: the male will then visit the females alternately, and they will not trouble themselves about each other; but without these precautions jealousy would incline them to fight and destroy each other's eggs.

When it is intended to place a great many females, double or treble the number of males, in a room or aviary, the latter should always be first paired with a single female, which will ever after remain the favourite; and it will only be when she is about to sit that he will pair with the others; and this is all the notice he will take of them, for afterwards he will only notice their young. It is from these mothers however that the most and the best birds are generally procured. If the floor of the room or aviary is well covered with moss, little else need be added for making the nests, otherwise they should be supplied with the hair of cows and deer, hog's bristles, fine hay, lint, wool cut two or three inches long, paper-shavings, and the like. That which is coarsest serves for the outside, and the softest and finest for the inside. If they have shrubs, traces of the natural instinct of the canary are soon observed in the nests, which they construct without the help of the turner or basket-weaver; but they are of an inelegant form, and the outside is not very carefully finished. The females alone, as is usual among birds, are the builders, the males only choosing the situation and bringing the materials. It is in the nest, where the female is in continual motion, that the pairing takes place; she invites the male by constant little chirpings, repeated more quickly the nearer she is to laying. Seven or eight days are generally reckoned from the first pairing to the laying of the first egg; the other eggs, whose number varies, without exceeding six, are laid successively every following day, and often at the same hour. The laying ended, pairing continues during the first days of incubation. If the pairs agree, they must be left entirely to themselves, without endeavouring to use art to help nature, as many do. It is usual to take away the first egg and substitute an ivory one, which is repeated with the others to the last, preserving them in the mean time in a box filled with fine dry sand: they are afterwards restored all together to the nest to be hatched. Upon this practice the translator of Bechstein's interesting and useful work observes in terms of censure, quoting Buffon in support of his opinion, because the plan above recommended causes the mother a greater loss of heat, and burdens her at once with five or six little ones, which coming together disturb rather than please her; whereas in seeing them hatched successively one after the other, her pleasure is increased, and her strength and courage are supported. 'Very intelligent bird-fanciers,' adds Buffon, 'assure us, that by not removing the eggs from the female, and leaving them to be hatched in succession, they have always succeeded better than when they have substituted ivory eggs.' The hen canary will generally lay three or four times in the year, from April to September, and some will even continue to lay during their moult. The eggs are of a delicate sea-green hue, spotted at one end more or less with violet or maroon colour. About the eighth day after the hen has begun to sit, the eggs may be examined by holding them between the flame of a candle and the eye. Those which are good will by that time exhibit well-developed blood-vessels, whereas the bad ones will continue clear, or be already addled—these should be thrown away. It may be doubted however whether the better course be not to leave the hen quite undisturbed. The cock will sometimes take his turn for some hours in the day; but the hen seldom approves of this: as soon as she has taken her hasty meal she flies back to the nest, and if the male, whose capabilities as a hatcher she seems strongly to question, do not retire, she pecks him till he does. On the thirteenth day the young generally make their appearance. While incubation is going on, the place where the birds are confined should be kept quiet; for it is asserted that sudden jarring noises, such as the violent slamming of a door, or the discharge of a gun, will kill the young in the shell. We have above seen that it is usual to give two females to one male; and it is alleged that, if one of the former should happen to die during incubation, the survivor immediately takes charge of the eggs, to the care of which she so entirely devotes herself, that she repels the caresses of her mate, whose solace she was while the deceased was sitting.

As soon as the young break the shell, two jars should be placed near the feeding-trough. In one of these there should be a quarter of a hard egg, yolk and white together, chopped very fine, with a bit of crumb of white bread or bis-

cuit, which has been soaked in water, and afterwards well pressed to get out the moisture. In the other jar rape-seed, well boiled and then washed in fresh water, should be placed: great care must be taken not to let this food become sour, which would destroy the nestlings. The cock-bird is the principal nurse after hatching.

It is sometimes necessary to bring up the young by hand, and then a paste should be made of white bread or biscuit pounded very fine, rape-seed well bruised, a small quantity of the yolk of an egg, and water. The nestlings must be fed with a quill cut into the shape of a spoon, and should not have less than ten or twelve meals a day: four beaksful well piled up on the quill constitute a meal. On the thirteenth day they will begin to feed themselves, and in four weeks they may be removed to other cages. Care however must be taken to supply them for some time with the paste above described, together with the food of full-grown birds, as a sudden privation of the former has been known frequently to occasion death; especially if the nestlings are deprived of it when moulting.

The translator of Bechstein says, 'It sometimes happens in very dry seasons that the feathers of the young birds cannot develop naturally: a bath of tepid water, employed on such an occasion by Madame —, was so successful, that I cannot do better than recommend it. The same lady succeeded equally well in similar circumstances in hatching late eggs; she plunged them for some minutes in water heated to the degree of incubation, and immediately replaced them under the mother: in a short time she enjoyed the pleasure of seeing the little ones make their appearance. This interesting experiment may be applied to all sorts of birds, and may be particularly useful in regard to those of the poultry-yard.'

About the thirteenth or fourteenth day, by which time the nestlings can eat alone, the males begin to warble and so do some of the females, but in a more disjointed style. The males, which may then be easily distinguished, should be forthwith separated, each bird being placed in a cage by himself (which must be first covered with a piece of linen and afterwards with a darker curtain) apart from every other bird, in order that his education may begin, if it is intended that his natural song should be superseded by an artificial melody: if he is left unseparated beyond the fourteenth day he will retain a portion of his father's song, and murder his acquired melody by intermingling the paternal notes. His musical lesson must be repeated five or six times in the day, especially in the morning and evening, his master performing the desired air either on a flageolet or a bird-organ, but, as has been observed in the case of the bullfinch, if the instrument be not in perfect tune the whistling of a man of taste is infinitely preferable. From two to six months, according to the memory and the abilities of the scholar, will be spent in this musical education. Some canaries have been thus taught to repeat correctly two or three airs, and others have learned to pronounce distinctly a few short words; for they possess great quickness and correctness of ear, and have excellent memories.

When the more natural song is preferred, those canaries are most esteemed which introduce into their warblings the notes of the nightingale, wood-lark, or tit-lark, and this may be easily accomplished by placing those birds near the young canaries. The canaries of the Tyrol are more frequently taught to introduce the notes of the nightingale, while those of England more frequently interweave those of the wood-lark. 'In Thuringia,' says Bechstein, 'the preference is generally given to those which, instead of a succession of noisy bursts, know how, with a silvery sonorous voice, to descend regularly through all the tones of the octave, introducing from time to time the sound of a trumpet. There are some males which, especially in the pairing season, sing with so much strength and ardour, that they burst the delicate vessels of the lungs and die suddenly.'

Canaries may be made to sing at night—some do this of their own accord. The tuition must commence early in their youth by covering the cage and thus keeping them in the dark during the day long enough for them to be hungry; they are thus brought to feed by candle-light, and at last sing. The hen birds will also sing, particularly in the spring, but in an unconnected style. Old hens past breeding will often sing in this way the year round.

There are societies in London for promoting the breeding of canaries, and amateurs distinguish upwards of thirty varieties.

London criterion of a perfect canary.—Professor Rennie,

in the article above alluded to, mentions two sorts of canaries, 'the plain and variegated, or, as they are technically called, the gay spangles or meally, and junks or jouquils. These two varieties are more esteemed than any of the numerous varieties which have sprung from them; although birds of different feathers have their admirers, some preferring beauty of plumage, others excellence of song, certainly that bird is most desirable where both are combined. The first property of these birds consists in the cap, which ought to be of fine orange colour, pervading every part of the body except the tail and wings, and possessing the utmost regularity, without any black feathers, as, by the smallest speck, it loses the property of a show bird, and is considered a broken-capped bird. The second property consists in the feathers of the wing and tail being of a deep black up to the quill, as a single white feather in the wing or tail causes it to be termed a foul bird; the requisite number of these feathers in each wing is eighteen, and in the tail twelve. It is however frequently observed that the best-coloured birds are foul in one or two feathers, which reduces their value, although they may still be matched to breed with.' These form the leading features of excellence; but it is generally the custom of the societies above-mentioned to award the prize to the competitor who produces a bird nearest to the model published by them the season prior to that wherein the competitors are to show for the prize.

For the diseases to which these pretty songsters are subject and their remedies we must refer the reader to Bechstein's excellent little book,* from which we have largely drawn, and to Professor Rennie's article in the last edition of Montagu. Some may perhaps think that we have devoted too much space to our canary birds; but, independent of the many physiological points of interest which the subject presents, one reason has, we confess, weighed greatly with us. The rich may indeed add the breeding of canary birds to their other manifold amusements, but we have thought of most of our poorer brethren while writing this article. In our great manufacturing towns there are thousands to whom the care of these interesting songsters would be a pleasing relief after the noise of the loom and the din of the workshop. It is a gratification within the reach of the English artisan: his German neighbours have long made the management of song-birds one of their principal recreations, while, notwithstanding the societies above alluded to, they are comparatively neglected in this country.

CANARY-GRASS. [*Phalaris*.]

CANARY GRASS (*Phalaris Canariensis*) is an annual grass, cultivated for its seeds, with which tame birds are fed, especially canary birds. The consumption of this seed is so considerable as to make it an article of commerce. Canary seed is chiefly cultivated in the Isle of Thanet in Kent, and about Sandwich. It requires a good soil, neither too light nor too wet, and an open country, without many hedge-rows: for small birds are so fond of the seed, that where they abound it is scarcely possible to protect the crop from their depredations. The plant grows like a strong grass, with an oval spike at the extremity of the stem. The seeds are closely enveloped by a strong chaff or husk, from which they are not easily separated; they are oval and pointed at both ends, and of a bright straw colour. The kernel of the seed is pleasant to the taste, and has the flavour of nuts.

Canary grass has been tried in a green state for cattle, but besides the price of the seed, which is high compared with that of other grasses, it has not been found sufficiently abundant or nutritious to make it preferable to any of the grasses usually cultivated for that purpose. When sown for the seed it is best sown in drills, at the distance of eight or nine inches from each other; this admits of hoeing, by which the quantity of seed produced is much increased, and it is kept free from the admixture of weeds. When it is reaped it is left for some time in heaps or wads, and exposed to the dews: this does not injure the seed, and by softening the husk facilitates its separation by threshing. The same effect may be produced by breaking off the heads from the stem with the flail, and pressing them close in casks or bags before they are perfectly dry; a slight fermentation takes place which renders the chaff brittle, and after some time the seed comes out very readily. The same thing is done with clover seed. The produce of an acre of canary seed is from three to five quarters.

CANCALLE or CANCALE, a town in France, in the department of Ille et Vilaine, is on the coast, a very few

miles E. of St. Malo, and just at the entrance of that deep bay which seems to take its name indiscriminately from Avranches and Cancale. The town has to the N. the small headland called Cap de Cancale, and on the E. the sea, which here forms a small roadstead. Cancale is known for ysters; Paris is supplied from it; and the English buy them for the purpose of purchasing oysters, which are deposited in the beds in the mouth of the Thames, or else pickled and put up in small barrels. Population, in 1832, 4880 for the whole commune.

In 1758, the English, under the command of the duke of Marlborough, landed near Cancale, and fortified a post near the town; they then approached St. Malo, but finding the town too strong for a *coup de main*, which was the object of their landing, they burnt the shipping under the walls of the town (amounting to 100 sail, many of them privateers), and the magazines of naval stores, and returning to Cancale re-embarked without opposition.

CANCELLARIA. [ENTOMOSTOMATA.]

CANCER, called also *carcinoma*, and *lupus* because it eats away the flesh like a wolf, a disease of a malignant character, the real nature of which, after all the observation and research of the surgeon, still remains wholly unknown. The term has been used with little discrimination, and the true nature of the malady not being understood, its diagnostic or distinctive characters are accordingly vague and indefinite. There is indeed a morbid structure induced by the disease which is quite peculiar, and therefore diagnostic; but unfortunately this can be perceived only after death, or after the excision of the affected part. However, surgeons are now agreed that cancer exists under two distinct forms, one of which is termed *schirrus* or *occult* cancer, and the other cancer properly so called, that is, *ulcerated* or *open* cancer.

Schirrus is an indolent, hard, and nearly insensible tumor, accompanied with little or no discolouration of the surrounding skin. It commonly commences as a small hard knot in the part which it attacks, and from this minute spot spreads in all directions like rays from a centre. In this state it has little or no pain, and it may be either distinctly circumscribed and moveable, or blended with the surrounding substance, and scarcely at all moveable.

As the disease passes from an indolent into a more active state the size of the tumour enlarges; its surface generally, though not invariably, becomes unequal; pain begins to be felt in it, slight at first, recurring at intervals, and progressively increasing, being always of a shooting or lancinating kind; the skin acquires a purple or livid hue; the cutaneous veins enlarge, become what is termed varicose, and spread out over the livid and puckered skin in such a manner as to present some likeness to the body of a crab with its claws extended, whence it has received the name of cancer. The most characteristic marks of a true schirrus then are puckering of the skin over the tumour, dull leaden colour of the integuments around it, knotted uneven feel of the tumour, and occasional darting pains through it. If to this assemblage of symptoms be added a uniform resistance to all the remedies employed to disperse the tumour, a constantly progressive enlargement of the tumour, and a manifest tendency to involve contiguous parts in the same morbid condition, the evidence of the true nature of the malady will be indubitable.

The rapidity of the progress of a schirrous tumour to open cancer is different in every different case. Sometimes indeed the induration remains in the state of schirrus for many years, and even to the termination of life, the skin never actually breaking. At other times the interval is short from the first discolouration of the skin to its termination in the state of ulceration, or the formation of open cancer.

The carcinomatous ulcer consists of a large chasm formed in the substance of the part in which the malady is seated, the chasm being produced partly by a sloughing and partly by an ulcerating process. The opened tumour is now found to consist of cells; as these cells burst and pour out their contents, which consist of a pulpy matter of different degrees of consistence and of various colours, the surrounding parts are irritated by an excreting ichor. This discharge sometimes takes place with a celerity which would induce the belief that it can scarcely result from the process of secretion. When the diseased actions have in a manner exhausted themselves an attempt at reparation appears to take place, analogous to those which, in other cases, lead to the restoration of a part from a diseased to a healthy state. Now flesh is formed, but instead of healthy muscle it con-

sists of a fungus of peculiar hardness, the formative vessels communicating to the new product the same qualities as to the tumour previously generated by their morbid action. This diseased fungus occasionally even cicatrizes, and so arrests for a time the progress of the disease. But the morbid action, though mitigated or suspended, is not subdued; it soon recommences its destructive course, and the part never returns to a healthy condition. In the meantime the disease extends through the medium of the absorbing vessels, and by their agency is propagated to parts at a considerable distance from the original tumour.

In the progress of the ulceration a good deal of blood is often lost from the destruction of the coats of the blood vessels. A burning heat is felt universally over the ulcerated surface, the source of unceasing torment. The shooting lancinating pains, sufficiently distressing in the occult state of the disease, now increase both in degree and constancy, and the strongest constitutions ultimately sink under the progressively augmenting irritation and suffering.

When a section is made in a schirrous tumour, in the early stage of its formation, its central portion is found to be more compact and harder than the other parts of its substance. This central portion, which often does not exceed in magnitude the size of a silver penny, is nearly of the consistence of cartilage, and from this centre radiate in all directions white, firm, ligamentous bands, which are crossed by transverse bands of a somewhat fainter appearance, and in this manner is formed a kind of net work, in the meshes of which the new-formed substance is enclosed.

In an advanced stage of the tumour the whole of the diseased part has a more uniform structure; no central part can be distinguished; and the ligamentous bands which extend in every direction, and which are still very apparent, do not follow any regular course, or at least not distinct enough to be traced.

When the tumour passes into the state of ulceration the central part of the ulcer consists of a small irregular cavity, which is filled up with a bloody fluid, the edges of the cavity being hard, jagged, and spongy, and exquisitely painful. Beyond the edges of the cavity there is a radiated appearance of ligamentous bands, diverging towards the circumference; but the tumour nearer the circumference is more compact, and is made up of distinct portions, each of which has a centre surrounded by ligamentous bands in concentric circles.

This disease is seated chiefly, though not exclusively, in parts which have a glandular structure. It is much more frequent in the female than in the male. Its most common seat in the female is the breast, and in the male the lips. Six times as many cancerous affections, says Mr. Benjamin Bell, occur in the female breast and in the lips as in all the rest of the body together.

The causes of the disease are involved in the same obscurity as its intrinsic nature. There sometimes appears to be an hereditary predisposition to it. Though no age be exempt from it, since it takes place at all periods of life, from five years old to fifty and upwards, yet it is certainly most common at the more advanced than at the earlier periods of life, and in the female especially it most frequently occurs about the period of the cessation of the catamenia, being manifestly connected with that disturbed balance of the circulation which takes place at this epoch in the female system.

It would be out of place to discuss here the palliative treatment of a malady which is commonly conceived to be susceptible of no cure. The knife of the surgeon, however, can sometimes extirpate a disease the fatal progress of which cannot be arrested by human skill. The suffering produced by the apprehension of being the subject of an incurable and painful disease must be mitigated by the knowledge that in the great majority of cases the malady may be removed by an operation which is hardly ever attended with danger. Formerly, indeed, there was but little encouragement to undertake or to undergo this operation. 'Of near 60 cancers,' says Dr. Alexander Monro, who wrote about a century ago, 'which I have been present at the extirpation of, only four patients remained free of the disease at the end of two years; three of these lucky people had occult cancers in the breast, and the fourth had an ulcerated cancer on the lip.'

Finding that this vast proportion always relapsed, and that of the great majority of those who relapsed the disease became more virulent and made a quicker progress than it commonly did in those on whom no operation had been

performed, this distinguished surgeon naturally proposes the question—'Whether ought cancerous tumours to be extirpated, or ought the palliative method only to be followed?' How different the result of modern surgery! Out of 88 genuine cancers extirpated by Mr. Hill from different parts of the body, all of which were ulcerated excepting four, all the patients excepting two recovered from the operation. Of the first 45 cases only one proved unsuccessful; in three more the cancer broke out again in different parts; and in the fifth there were threatenings of some tumours at a distance from the original disease. All the rest of the 45 continued well as long as they lived. Of the next 33 one of them lived only four months; in five more the disease broke out afresh after having once healed. 'The reason why out of 45 cases only four or five proved unsuccessful, and six out of 33, was,' says the operator, 'because the extraordinary success I met with made cancerous patients resort to me from all corners of the country, several of whom, after delaying till there was little probability of a cure by extirpation or any other means, forced me to perform the operation, contrary both to my judgment and inclination.'

'From these and many other authenticated facts,' says Mr. B. Bell, who saw many of Mr. Hill's cases, and who bears witness to the accuracy of his statements, 'there is very great reason for considering the disease in general as a local complaint, not originally connected with any disorder of the system; and if in every case of real cancer recourse were had to the operation as early as possible, that is, soon after the appearance of the affection, and before the formation of matter takes place, the return of the malady would probably be a very rare occurrence.'

These statements place in a strong light the paramount importance of attending to the very first indications of this dreadful distemper, and the folly of concealing, as is too often the case, especially on the part of the female, from a feeling of false delicacy, the existence of a malady which, if neglected, will be sure to terminate in death, attended with agonizing suffering; but which, if properly treated in the commencement, may be easily removed. (See Pearson's *Practical Observations on Cancerous Complaints*; Abernethy's *Surgical Works*; Sir E. Home's *Observations on Cancer*; and Cooper's *Dictionary of Practical Surgery*.)

CANCER in the domesticated quadrupeds is oftenest observed in the bitch, and every character and stage of it may be satisfactorily traced. A small, hard, insensible, isolated tumour is felt in one of the teats. It seems to give no pain, and causes no kind of inconvenience; it is not larger than a pea, perhaps not of greater size than a millet seed. During many months it seems scarcely or not at all to grow, but it never retrogrades. After an indefinite period of time however it begins evidently and rapidly to increase, and smaller ones may be detected at its base. It then assumes an irregular figure, and the whole, or portions of it, become hard—of a scirrhous hardness, and perfectly incompressible; other portions are soft, perhaps hollow, and cellated. At length a portion of the tumour begins to become prominent and soft. It is intensely red, then purple, and after a while it breaks, and discharges a corrodng ichorous fluid. The tumour is evidently deorganised deeply within its substance, and a cancerous ulcer, with an irregular elevated edge, is established. Perhaps it heals in the course of eight or ten days, but it soon opens afresh, wider and deeper, and at length the animal is destroyed, either by the general irritation which is established, or by the contamination of the circulating fluids, which are speedily effected by the vitiated secretion of the part.

Iodine, which has so much power in dispersing glandular and many other tumours, is inert, whether applied externally to the cancerous tumour or ulcer, or administered internally, in order to affect the constitution. The excision of the tumour is generally useless after it has acquired any considerable bulk, for it will appear on examination that the constitution is affected, and that the nuclei of other tumours are to be found in the other teats. After the ulcerative process has been once established the case is perfectly hopeless. Even if the nuclei of new enlargements cannot be felt, the animal will nevertheless soon perish, from the development of the disease internally, or, to speak more properly, from metastasis of the disease.

The only effectual mode of treatment is to remove these nuclei as soon as they are perceived, and before the system can be contaminated.

The cause of cancer in these cases is the comparative inactivity of certain parts, which nature intended to be ac-

tively and usefully employed. At every period of life in the bitch there is a secretion of milk in the teats, not being drawn away in the natural process of suckling, the fluid is long detained in the teats, irritates them by its presence, and produces this specific and fatal inflammation. Hereditary predisposition, overfeeding, and sometimes external violence, are sources of scirrhous tumours.

Cancer is found also in the vagina and uterus of the bitch, and occasionally canker in the ear assumes the character of true cancerous ulcer. All applications and operations are perfectly useless.

In the teats of the cat, cancer establishes itself to an extent that would scarcely be thought credible. The whole of the external surface of the belly often presents one horrible mass of cancerous ulceration.

The horse is subject to cancer in the eye, and the scrotum externally; and the kidney, and the vagina, the uterus, and particularly the pyloric orifice of the stomach internally. The symptoms by which the presence of internal cancer might be indicated are not known, and if they were, no medical skill could arrest the evil.

Cattle and sheep are subject to cancer of the jaw, the eye, the scrotum, and the udder externally; and of the pyloric orifice of the fourth stomach internally.

CANCER, the Crab, the fourth constellation of the zodiac, being one of those in Ptolemy. From the end of January to that of April, its time of coming on the meridian in this country varies from midnight to six in the evening. In the obsolete and useless division of the ecliptic into signs, Cancer is the part of that circle between 90° and 120° from the vernal equinox. The surrounding constellations are Hydra, Leo, Lynx, Gemini, and Canis Minor.

There are edifying mythological stories in Hyginus, &c. [ZODIAC.] The mythology of the minor constellations is hardly worth a reference.

In the following list, the letters in parentheses are those which are not in Bayer:—

INCER, TROPIC OF. [TROPICS.]

INCER. [CHAM.]

CANCROMA. [BOAT-BILL.]

CANDA. [CELLARIEA.]

CANDAHAR. [AFGHANISTAN.]

CANDEISH or **CANDEISH**, a province of Hindustan, between 20° and 25° N. lat., and 73° and 77° E. long. It is bounded on the N. by Malwa, on the E. by Berar and Gundwana, on the S. by Aurangabad and Berar, and on the W. by Gujerat. Its length from E. to W. is about 210 miles, and its average breadth about 80 miles. This province is described in the *Aym-i-Akbari* as the soubah of Dandees, which was originally named Khandesh, but received the name of Dandees when the capital, Aseerghur, was taken by the Emperor Akbar. [ASEERGHUR.]

Candeish is generally a level country, but is nearly surrounded by mountains. On the N. it has the Satpoora or Indragiri range; on the S. the range on which the fort of Chittore stands, and the Ajuntce ghaut; on the S.W. are the Syadree Mountains, forming part of the Western Ghauts; and in continuation of these, on the S. side of the Tuptee river, are the hills of Baglana. Low sterile hills are scattered over the plain of Candeish, but with this exception the province is very fertile. In addition to the Tuptee and the Nerbudda the province is watered by several copious streams, which flow from the table-land and fall into the Tuptee.

This country, which was once inhabited by a numerous and thriving people, has of late years been rendered a scene of desolation. The ravages committed by Jeswunt Rao Holkar in 1802 caused a famine in the following year, which carried off a large proportion of the inhabitants. After this the Bheel tribes, whose chiefs command most of the passes in the mountain range to the N., and the Pindaries were accustomed to make periodical incursions into the plains for plunder. In 1818, Candeish, then among the possessions of Holkar, was ceded to the British, but the Arabs, who had previously obtained a footing in the country, opposed the British authority, and it became necessary to undertake their subjugation. Although not numerous, their retreats in the mountain-fastnesses render it difficult to subdue them, and it was not until the end of 1819 that the British had quiet possession of the province. At that time nearly one half of the villages had been abandoned to the tigers, which swarmed throughout the land. Where luxuriant harvests formerly grew, an impenetrable jungle had sprung up, and although the government has since held out every inducement to cultivators by granting land upon easy terms, it will be a long time before all the mischief can be repaired.

The principal towns in the province are, Boorhanpore, Aseerghur, Hindia, Nundoorbar, and Gaulna. [BOORHAN-PORE, ASEERGHUR.] Hindia is situated on the S. bank of the Nerbudda, where its channel is 3000 feet wide, in 22° 26' N. lat., and 77° 5' E. long. This place is chiefly important from its position, as commanding some of the best fords across the Nerbudda; its defences are by no means strong. Nundoorbar contains about 500 houses, and was formerly a place of much greater extent. The wall by which it was surrounded is now, for the most part, in ruins. This town is in 21° 25' N. lat., and 74° 15' E. long. Gaulna was once a large town, but has fallen greatly to decay. The town stands on a high rocky mountain, and is surrounded by a stone and brick wall 20 feet high and a mile in circumference. The town, which lies under the N. side of the mountain, is surrounded by a mud wall and towers. The place is abundantly supplied with water, which is preserved in tanks.

(Mill's *History of British India*; *Institutes of Akbar*; *Reports of Committees of House of Commons on the Affairs of India*.)

CANDELABRUM, an article of furniture used by the ancients both in their public edifices and private dwellings. The candelabra used in public edifices were usually of a greater size, and made with a large cup at the top to receive a lamp or sufficient unctuous material to feed a large flame: they were also probably employed for burning incense in the temples. Candelabra have been found in the private dwellings discovered at Herculaneum and Pompeii consisting of tall slender bronze stands, sometimes with a flat circular top. In other instances they have a vase-like top, also flat, or with a socket, and projecting feet at the bottom of the long stem on which the light was placed. The flat

the top was called by the Greeks *pinakion*, or 'little table' (*ἰνᾶκιον* or *ἰνυσιδίων*). The forms of candelabra were varied in all possible ways to please the taste of the wealthy: sometimes the stand was a human figure, holding in one hand the cup or receptacle of the oil, and ornamented with gilding:—

*Si non aurea sunt juvenum ainsolabra per aedais
Lampadas ligniferas manibus resedentia dextris,
Lumina nocturnis epulis ut suppeditantur.*

(Lucretius, ii. 24.)

These candelabra or lamp-stands, 'in their original and simple form, were probably mere reeds or straight sticks fixed upon a foot by peasants to raise their light to a convenient height. Sometimes the stem is represented as throwing out buds; sometimes it is a stick, the side branches of which have been roughly lopped off, leaving projections where they grew.' 'Some have a sliding shaft, like that of a music stand, by which the light might be raised or lowered at pleasure.' The annexed cut represents two bronze candelabra, one of a simple form, the other in some measure complicated. 'The base is formed of three goats' legs, each having a ring at each end, 5, 6, 5. The centre piece is attached to the side pieces by rivets; 3, 4, round which these rings are allowed to turn, so that the three lie either parallel when the candelabrum is taken to pieces, or may be made to stand at equal distances in the

[Bronze Candelabrum from Herculaneum]

[A, moveable Candelabrum; C, moveable shaft; 1 1, connecting joints of the legs.]

circumference of a circle, in which case the two exterior rings lap over each other, and are united by a moveable pin. The end rings, 5, 5, 5, which are placed at different heights, as shown at *h*, will then be brought into the same vertical line; and the round pin, *c*, which terminates the stem, passes through them and is secured by a pin, *7*, passing through the hole, *8*, which keeps the whole tight. The shaft is square and hollow, and surmounted by two busts. Within this lower shaft a smaller shaft, *e*, plays up and down, and is fixed at any desired height by the pin, *f*. (*Livory of Entertaining Knowledge—Pompeii*, vol. ii. pp. 295-6.)

The annexed cut of a marble candelabrum is from Piranesi's work, 'Vasi, Candelabri, Urne, Tripodi, ed altri Or-

namenti Antichi,' 2 vols. fol. atl., Romæ, 1778. In these works excessive richness in the design and delicacy in the execution are often combined. Two exquisite works of candelabra, carved in marble, are preserved in the Radcliffe Library, Oxford. The fragments of which they are composed were found in the villa of Hadrian at Tivoli, and were presented to the university of Oxford by Sir Roger Newdigate.

[Marble Candelabrum, from Piranesi's works.]

It appears that a smaller kind of candelabrum was used as an altar. (See bas-relief engraved in the *Museo Chiaramonti*, vol. i.; also p. 56, note 24. The plates xxxvii.,

xxxviii., xxxix., xl., vol. vii., *Museo Pio Clementino and Chiaramonti*, contain representations of ancient candelabra. (See also the dissertation of Ch. Monsignor Gaetano Marini, *Sopra gli Usi de' Candelabri*.) The marble candelabrum in the Townley collection of the British Museum is about seven feet high, with a representation of a large flame on the top. In the Townley collection there are also several bronze candelabra from twelve inches in height to upwards of five feet, and of various patterns. They are mostly flat on the top, although some are formed with a cup-like top, as if for a large flame. One has a spike to receive a clay lamp, with a hole in the centre. There is also one formed upon the principle of the lamp represented in the cut, so that it can be raised or lowered at pleasure. In all, there are about seventeen lamps, of which some of the annexed engravings are representations. In the *Museo Borbonico* are several representations of bronze candelabra found in Herculaneum and Pompeii.

[Small Candelabra, from the Townley Collection in the British Museum.]

CA'NDIA, the ancient Creta, one of the largest islands in the Mediterranean sea, situated at the entrance of the Archipelago, and between the S.E. coast of the Morea, the Libyan or Barca coast, and the S.W. coast of Asia Minor. Its length from E. to W. is about 160 miles from Cape Salmone to Cape Crio: its breadth is very unequal. In some places, towards the middle of its length, it is about 30 miles broad, in others about 20, between Retimo and Spinalonga, and in one place in the E. part of the island between the gulf of Mirabel and the coast of Hierapetra only 6. It has three principal capes: Samonium, now Salmone, at the E. extremity towards Rhodes, Corycum now Crio, at the N.W. looking towards the Morea, and Crio S.W. looking towards the Cyrenaica. Its coast, especially towards the N., is indented by deep gulfs, of which those of Khania, Ksania, Suda, Armyro, and Mirabel, or Spinalonga, are the deepest, and the three principal towns of the island, Khania, or Khania, Retimo, and Candia are on that side. The S. coast is rugged and iron-bound. A continuous mass of high land runs through the whole length of the island, about the middle of which Mount Ida, now called Psilorati, rises far above the rest, to the height of 7674 feet according to Sieber's observations. (*Orographie de l'Europe*). The mountains in the W. part of the island are called by Strabo Leuca Ore or white mountains; he says there are about as

is (probably about 6000 feet). It is supposed the modern name of Candia (candida) is derived from the white appearance of these mountains as seen from sea; but according to Seydlitz the Byzantine chronicler, the name of Candia was given by the Saracens to the town, which they built, and which still bears that name, signifying in their language 'an entrenchment.' In the S.W. part of the island the mountains run close to the coast. This is the district of the Sphakiotas, a race of mountaineers, occasionally robbers and pirates, who have never been totally conquered by the Turks. The rivers of Candia are only a kind of torrents, very shallow in the dry season.

The ancient history of Crete begins with the heroic or fabulous. Historians and poets tell us of a king called Minos, who lived before the Trojan war, and resided at the site of which is not far from the present town of Iraklio, and ruled over the greater part of the island. He was legislator of the country, and his laws became celebrated among the Greeks, who borrowed from them. (Strabo, x. p. 328.) He employed Dædalus, an Athenian artist, on his return from Egypt, to build a labyrinth in imitation of that of Moeris in Egypt; and he afterwards confined in it Dædalus himself. Minos, according to tradition, was also the first who had a navy: he cleared the Grecian seas of pirates; expelled the Carians from the Cyclades, and settled his sons in them. (Thucyd. i. 4.) Then comes the well-known story of the Minotaurus, Theseus and Ariadne. Idomeneus, a grandson of Minos, one of the Cretan chiefs who went to the siege of Troy, on his return was driven away by his subjects, and went to found the colony of Salentum on the coast of Iapygia. After the expulsion of the dynasty of Minos, Gortys, a town built in the centre of the island near the foot of Mount Ida, became a powerful rival to Cnossus. Crete had once many flourishing cities, some say a hundred: the principal, besides Cnossus and Gortys or Gortyna, were Cissamus, Cydonia now Canea, Amphilimalla, Rithymna, now Retimo, Heracleum the port of Cnossus, and Miletus, all on the N. coast; Phalasarna on the W. coast; Lyctus, Phoenixportus, and Hierapetra on the S., and Ampelos on the E. coast. Strabo, whose maternal ancestors were from Cnossus, although he himself was born in Pontus, gives a pretty full account of the Cretans, their laws, their towns, and the wars between them; and Aristotle in his 'Politics' (book ii.) has described the peculiar institutions of the ancient Cretans. The E. part of the island had been colonized by the Dorians, the W. part was inhabited by the Cydonians, and the S. by the Eteocretes. It was two days sail from the S. coast of Crete to Cyrenaica and four to Egypt.

The Cretans were often at war among themselves or with their neighbours the Cilicians, and with the kings of Syria and of Egypt. They materially assisted Dometrius II. Nicator to recover the throne of Syria, over the usurper Alexander Balas, 148 B.C. (Justin, xxxv. 2.) The Cretans were celebrated for their archery, and in the later period of their political history were often employed as mercenary troops by other nations.

Crete was conquered by the Romans, 67 B.C., under the proconsul Quintus Metellus, after an obstinate defence. It became a Roman province, and a colony was sent to Cnossus. The Cretans seem to have been notorious for dishonesty and lying. 'Cretizare cum Cretensibus' was a common proverb, meaning 'to deceive the deceiver.' St. Paul, in his epistle to Titus, whom he had appointed to preach the Gospel to the Cretans, alludes to the bad reputation of the people.

Crete remained subject to the Roman emperors, and afterwards to the Byzantines, till A.D. 823, when it was conquered by the Saracens, who built the town of Candia, which has ever since been considered the capital of the island. Nicephorus Phocas retook it in 961. After the taking of Constantinople by the Franks, Baldwin I. gave the island of Candia to Boniface, Marquis of Montferrat, who sold it to the Venetians in 1204. The Venetians kept possession of Candia more than four centuries; it was one of their chief possessions in the east, and the first of the three subject kingdoms (the other two were Cyprus and the Morea) whose flags waved over the square of St. Mark. The island was governed by a provincial general from Venice who had under him the four provveditors of Canea, Candia, Retimo, and Sitta. For judicial matters there were Rettori or judges sent also from Venice, each of whom was assisted by two councillors who were natives of the island. The municipal administration was in the hands of the Candiotas. The

taxes were very moderate. The native nobility enjoyed feudal privileges, and they were bound to have a certain number of militia from among their vassals and tenants ready when called. The whole of this militia was reckoned at 60,000 men. Although most of the natives were of the Greek church, and had their own clergy, there was an archbishop of the Latin or western church who was sent from Venice. In 1645 the Turks landed 50,000 men, besieged, and took Candia; in the following year they took Retimo, and in 1648 laid siege to Candia the capital of the island. This siege, the longest in modern history, lasted 20 years. The Venetians strained every nerve for the defence of the place. The order of Malta, the pope, the duke of Savoy, Louis XIV., all sent auxiliaries to the relief of Candia. The vizier Achmet Coprough was at last sent, in 1667, by the sultan with great reinforcements to carry the place; Francesco Morosini conducted the defence. In September, 1669, the Venetians, having exhausted every means, surrendered Candia to the vizier by a convention in which they retained the forts of Suda, Spinalonga, and Carabusa, on the coast of the island. The wars of Candia cost the senate 25 millions of ducats. In the last three years of the siege 29,000 Christians and 70,000 Turks were killed. The Turks made 69 assaults, and the Venetians made 80 sorties: the number of mines exploded on both sides was 1364. (Daru, *Histoire de Venise*; Botta, *Storia d'Italia continuata da quella del Guicciardini*.)

The Turks divided the island, which they call Kirid, into three governments or pashalics, Canea, Retimo, and Candia. The sultan gave up the island of Candia about ten years since to Mehemet Ali, the pasha of Egypt, as a compensation for his expenses in the war against the Morcoses. It is now a pashalic dependent on the vizier of Egypt. Candia, the capital, is still a strong place, but much decayed compared with what it was under the Venetians, and its harbour is nearly filled up. The immediate governor of the island resides here, as well as the archbishop of Gortys, who is primate of Candia. Canea is the most frequented harbour in the island. Retimo has also a small port. On the S. coast are the small towns of Hierapetra and Sphakia. We have no authentic statement of the population of the island, although it has been stated at 300,000.

The soil of Candia is fertile, and produces wheat in abundance, good wine, oil, lemons and oranges, and all sorts of fruit. A quantity of honey and several kinds of gums are collected. The sugar cane and the palm-tree also thrive here. The ladanum, *cistus ladaniferus*, is found in abundance, and is described in Tournefort's account of Candia, which though old is still one of the best. A great quantity of white soap is exported from Candia.

Although the island is nearly filled with mountains there are several extensive valleys or plains: that of Messaria, which is near the centre of the island near the site of the ancient Gortys, is the most productive. The country about Retimo and the plain near Candia are also very fertile. *In Walpole's collection of *Travels in various Countries of the East*, there is an account by Mr. Cockerell of an excursion from the town of Candia to a curious excavation in a mountain about three miles from Agio Deka, a village near the site of Gortys, and 20 miles inland from Candia, which the inhabitants call by the name of the labyrinth. It is a very intricate maze, cut through a freestone rock; many of the passages are very low and narrow, but the principal way is about eight feet wide, and as many in height. There are several square chambers at the ends of some of the passages, and piers have been left in the middle to support the superincumbent rock. Tournefort had visited this excavation. Mr. Cockerell has explored all the excavation that was accessible, of which he gives a plan; it is in its whole length, including the windings, about three-quarters of a mile, but this is evidently only part of the whole, as many of the passages are stopped up in consequence of the falling in of the rock. It has been said that this excavation may have been originally a quarry, and afterwards made into a maze for the purpose of concealment or confinement. Some have supposed this to have been the labyrinth of Minos, which however we are told was a building, and stood near Cnossus. The site of ancient Gortys, which Tournefort describes as being in his time strewn with monuments and ruins, is said by Mr. Cockerell to contain only the ruins of a temple, and some other inconsiderable remains. A great number of Caloyers are scattered about the island, and to be possessed of considerable landed property.

Turks, many of whom are sons of renegade Greeks, have the reputation of being among the most turbulent, fanatical, and quarrelsome among the Mussulman populations on the coasts of the Levant. The Candiot Greeks have not a much better name than their Mohammedan countrymen. The little island of Carabusa, well known in our times as a nest of pirates, lies at the N.W. extremity of the island.

(Strabo, lib. x.; Sieber, a German traveller, visited Candia in 1817, and published his *Reise nach Kreta* in 1823; Hoeck's *Kreta*, published about the same time, is the best authority for the ancient history of the island.)

CANDLE—French, Chandelie; German, Lichter; Dutch, Kaarzen; Italian, Candela; Spanish, Velas; Portuguese, Velas; Russian, Swjetschi; Latin, Candela. Candles are commonly made of tallow, but superior kinds are made of bleached wax, or of the purified head-matter of the spermaceti whale, or of a composition of purified tallow and wax. Very recently the concrete matter from which the more fluid portion of the oil of cocoa-nuts has been separated by pressure has been used for making candles, and some manufacturers have separated the fatty from the oily substance of tallow, and have used the former alone, which is called *stearine*, for the purpose. The form of a candle is always cylindrical, and a fibrous and combustible substance called a wick always occupies the centre of the cylinder throughout its length.

The process by which light is produced from the combustion of a candle or a lamp is the same in both cases, with this difference, that the solid matter of the candle must be rendered fluid by the heat of the wick previous to its conversion by the continued application of heat into inflammable gas. In all cases the office of the wick is merely mechanical, serving in the first instance by the heat given out during its combustion to fuse that portion of the tallow or wax to which it is more nearly applied, and then to take up through its fibres the fluid matter, which is thus prepared by minute division for decomposition and combustion.

It is essential to the goodness of a candle that the size and substance of the wick should be adapted to the substance of the candle. If the wick be too thin, it will not be capable of absorbing the fused portion of the candle so fast as it is melted, and thus unabsorbed portion will consequently run down the side of the candle and be wasted. If, on the other hand, the wick should be too large, perfect combustion will be impeded through the want of air in the middle of the wick, and the melted fatty substance being less completely decomposed will pass off unignited in the form of smoke: in this case too the light will be partially impeded by the body of the wick. Candles made of wax and of other matters which fuse less easily than tallow consequently burn longer than tallow candles, and yield a purer and steadier light. The less fusible matter requires a smaller wick to act as its carrier and to place it in circumstances favourable for combustion, and this smaller wick being less capable than the more substantial wick of a tallow candle of supporting its own weight, the extremity falls out of the perpendicular, and being brought into contact with the oxygen of the atmosphere is consumed: the wick of a wax candle consequently requires no snuffing as that of a tallow candle does, in order to ensure the brilliancy of its flame, neither does it occupy so large a space in the centre of the flame, and so intercept the rays of light given off during the combustion.

Various plans have been proposed to obviate the inconvenience of snuffing tallow candles. One of the most ingenious of them was the subject of a patent in 1799. This plan consisted in making the candle a solid cylinder throughout without any wick in the centre, and applying on the top of the candle a very short wick which acted in the same manner as the short wick of a lamp. Two different methods were employed for keeping this wick in contact with the top of the candle during its combustion. One was to attach the wick to a small metallic frame or ring which was placed round the top of the candle like a collar, and was of such a size as to admit of its moving freely on the candle, so that it sunk in proportion as the matter of the candle was consumed. A cross piece, in the centre of which a socket was made for the insertion of the wick, kept the latter in its proper position, and prevented the undue sinking of the

The other method was that of attaching the wick as an altar. Of keeping the top of the candle in contact with a spiral spring

which constantly pressed the candle upward against the frame that contained the wick. It is probable that one principal cause of the failure of these contrivances arose from the nature of the substance of which the candles were made; the unconsumed carbonaceous matter would form a crust upon the wick which would occupy in part the place of the flame, and thus to a considerable degree cause the same inconvenience as the ordinary wick.

There are two ways of making candles, which are distinguished as *dipped* or *mould* candles according to the method employed. Dipped candles are made as follows—Wicks made of spun cotton are selected of a size proper for the intended diameter of the candle, and are cut into the requisite lengths by a simple and convenient machine, being first doubled and twisted so as to leave a loop at one end. Into this loop a smooth cylindrical stick half an inch in diameter and about three feet long is inserted, and several of the cottons or wicks, being so treated and arranged at regular intervals on the stick, are ready to receive their external coating of tallow. The number of cottons ranged upon each stick varies according to the size of the candles to be made, it being usual to place such a number as, when the requisite quantity of tallow has been attached, will weigh two pounds: e. g. if candles eight of which will weigh a pound are to be made, 16 wicks are ranged upon each stick; if six are to make a pound, then 12 wicks are used, and so on. The tallow, being previously melted and strained, is placed in a kind of trough, into which the wicks are dipped three times for the first 'lay'; after being kept a short time over the trough for the wicks to drain, the sticks are placed on a rack from which the candles hang freely, and are thus allowed to harden. The same process is repeated a second and a third time and oftener, according to the required weight of the candles. Where large quantities are to be made, several sticks are placed together in a kind of frame, and are lowered into the melted tallow and raised again by machinery, a counter-weight being used in order to indicate when the wicks have taken up the required quantity of tallow.

During the operation the tallow in the trough must be stirred from time to time and fresh tallow supplied, the whole being kept in a proper state of fluidity by the external application of a brazier or a bath of hot water.

Mould candles are made in cylindrical moulds of pewter, one end of which is smaller than the other to allow of the easy removal of the candles. From 10 to 16 of these moulds are placed together in a wooden frame, so that their larger ends terminate in a kind of trough common to the whole. The wicks are inserted and kept firmly in their proper places in the centre of each cylinder by strong wires. The frame being then placed with the trough uppermost, the moulds are filled with melted tallow and are placed in the air to cool, after which the wires by which the wicks are fixed are withdrawn, the superfluous tallow is removed from the trough, and the candles are pulled out of the moulds.

The process used in making wax candles is different. The wicks being cut and twisted in the manner above described, a set of them is suspended over a basin of melted wax, which is taken up by a large ladle and poured from time to time on the tops of the wicks, and the melted wax running downwards adheres to and covers the wicks throughout their length. This is repeated until a sufficient weight of wax has been gathered upon each. After the candles are sufficiently cooled they are rolled upon a smooth table in order to give them a perfectly cylindrical form, and are then polished.

For a long time tallow candles were subject to an excise duty of one penny, and those made of wax and spermaceti of threepence halfpenny per pound. This duty was repealed from the 1st of January, 1832. During the last five years of its continuance, excluding 1831 when the manufacture of candles was checked in anticipation of the ceasing of the duty, the quantities of tallow and of wax and spermaceti candles respectively which were made in this kingdom were as under:—

	Tallow.	Wax and Spermaceti.	Net produce of Duty.
	lbs.	lbs.	£
1826	110,102,643	907,405	467,101
1827	114,939,578	932,932	437,308
1828	117,342,157	1,014,556	497,933
1829	115,556,802	1,049,795	490,730
1830	115,586,192	1,265,113	483,413

The statements of the custom-house as regards exports

include together soap and candles, so that it is not possible to ascertain what proportion of the above quantities have been consumed within the kingdom.

CANDLEBERRY-TREE. [MYRTICA.]

CANDLEMAS, the popular name for the Feast of the Purification of the Virgin Mary, February 2nd, derived from the lights which were then distributed and carried about in procession. These lights, it should seem, were carried more immediately in allusion to the prophetic words of Simeon, who, speaking of the infant Saviour, presented in the temple at the same time, said he was 'a light to lighten the gentiles.' Alcuin, *De divinis Officiis*, p. 231, says, the candles at the purification were an exchange for the lustration of the pagans. From this ceremony of purification the present religious ceremony of the churching of women after child-birth arose.

The Doctrine of the Masse Booke, &c., from Wyttonburge, by Nicholas Dorchester, 8vo., 1554, preserves the prayer for the hallowing of candles upon Candlemas Day. The candles, having been sprinkled with holy water, were lighted and distributed. They were considered to possess a virtue sufficiently powerful to frighten away devils, and to be a charm against thunder and lightning. Stowe, in his *Annals*, fol. 1631, p. 595, says, 'On the 2nd of February, 1547-8, being the Feast of the Purification of our Lady, commonly called Candlemasse Day, the bearing of candles was left off throughout the whole city of London.'

'There is a general tradition,' says Sir Thomas Browne, 'in most parts of Europe, that inferreth the coldness of succeeding winter from the shining of the sun on Candlemas day, according to the proverbial distich—

" Si Sol splendescat Mariæ purificante,
Major erit glaciæ post festum quam fuit ante "

A French Almanac of 1672 says—

Selon les anciens on dit,
Si le soleil clairement luit
A la Chandeleur, vous verrez
Qu'encore nu l'hyver vous auras :
Pourtant gardez bien vostre soin,
Car il vous sera de besoin :
Par cette règle se gouverne
L'ours, qui retourne en sa caverne.'

Candlemas Day was also called Christ's Presentation, the Holiday of St. Simeon, and, in the North of England, the Wives' Feast Day. (See Brand's *Popular Antiquities*, 4to. edit., vol. i., p. 38; Brady's *Clavis Calendaria*, 8vo., London, 1812, vol. i. p. 184; Sir T. Browne's *Vulgar Errors*, fol., 1646, p. 289.)

CANDY, the Maha Neura, or great city of the Cingalese, and the capital of the king of Candy's dominions, is situated in the Rattio, or county of Yatineura, in 7° 17' N. lat., and 80° 36' E. long.

The city stands in the midst of steep and lofty hills covered with jungle, at the head of an extensive valley, and about 1467 feet above the level of the sea. It is surrounded by a mud wall, but its principal defence from hostile attacks consists in thick thorn hedges, which are drawn round the hills like lines of circumvallation, leaving only narrow passages, which are guarded. The city is also nearly surrounded at the distance of three miles by the river Mahavilly Ganga, which is crossed at a ferry where the river is rocky and rapid; a strict guard is kept at this ferry.

The principal street is on the declivity of a hill, and is nearly two miles long, but built in a very straggling manner. The houses are of mud, and only one story high, standing on foundations raised about five feet above the level of the street. The houses of the chiefs are tiled and white-washed, the others are thatched. The palace covers a considerable space, and contains a great number of rooms, the walls of which are grotesquely painted. In one room is a colossal brass figure of Buddha, with two smaller figures at his feet.

In the beginning of 1803 a British force entered the Candian territory, and on the 20th of February arrived before Candy; when the king and his chief officers withdrew, after setting fire to the palace and other principal buildings. In the following June, when the English garrison were in a sickly state, they were attacked by a considerable native force and obliged to capitulate, on condition of being allowed to quit the city unmolested, with arms and ammunition, and that proper care should be taken of the sick. Scarcely however had the English troops quitted Candy when the latter part of the stipulation was treacherously broken, and the sick persons were murdered.

The total population of Candy was estimated in 1819 to amount to no more than 3000 souls. The climate is comparatively cool, the mean temperature for the year being about 74° Fahrenheit. This city is about 65 miles direct distance, E.N.E. from Columbo, and 95 miles S.S.W. from Trincomalee.

CANDY-TUFT. [IBERIS.]

CANE. [CALAMUS.]

CANEA, or **CANNA**, one of the three sandshaks or circles of the Turkish ejalet of Kirid, which consists of the island of Candia. It occupies the western district of that island, and on its northern shores lies a promontory, terminating in Cape Melek, and forming the Bay of Suda. The declivities of the Sphachio mountains, which form its southern borders, are stony and naked, and the mountains themselves are covered with snow for four or five months in the year; the adjacent parts, however, afford excellent pastures, where large herds and flocks are reared. The lowlands near the coast produce grain and oleaginous seeds, cotton, flax, honey, wax, and some fruit. Canea, the capital of the sandshak, and the residence of the bey and of a Greek bishop, is surrounded by strong walls and deep ditches, both of which are in a state of great dilapidation; it is situated on the northern coast, and contains a small fort with a lighthouse, several mosques and Greek churches, a Capuchin monastery, and about 9000 inhabitants, of whom 2000 are Turks and 300 Jews. The harbour, by neglect in cleansing, has become so shallow that only vessels of small burthen can enter. It is the principal mart for Candian commerce, and carries on much trade with France, Trieste, Venice, &c., in wax, soap, oil, and other products of the island. A number of French merchants have established themselves here. There are some vaulted basins for the docking of ships, and several store-houses along the sides of the harbour. The environs are pleasant; thick woods of olives are interspersed with corn-fields, gardens, and vineyards, and a number of rivulets, shaded with roses and myrtles, wind through them. Canea is the site of the antient Cydonia, and fell under Ottoman dominion in 1645. At the present time (1836) this town, as well as the whole island, is occupied by the Pasha of Egypt. 35° 25' N. lat., 24° 2' E. long.
